It is remarked by Mr. White that "the earlier stages of this complaint are not marked by very striking symptoms. The animal has a dull, or languid appearance; and generally, a rough unhealthy coat and tight skin. The appetite is diminished, and at length he ceases to chew the cud. The eyes and mouth have generally a yellow appearance.

"To cure this disease, it should be attacked at an early period; for when the liver has become affected in a considerable degree, it terminates fatally. Should there be any appearance of costiveness, the following warm laxative is first to be given; more commonly, however, the bowels are in a loose state, and the dung has an unhealthy appearance; in this case, let

the tonic drench be given morning and evening, and let the animal be kept in a warm sheltered situation. It may be necessary to repeat, that this, like most other internal diseases of cattle, may generally be removed by timely attention; but in attempting a cure after they have existed some time, a great deal of unnecessary expense is often incurred.

Warm Laxative

Barbadoes aloes	1 oz
Castile soap	6 dr
Ginger	3 dr
Cascarilla bark	2 dr
Warm water	1 pt

Mix

After the operation of the laxative, the tonic drench may be given, should it be found necessary.

Tonic Drench.

Cascarilla bark & ginger, of each	2 dr.
Soda	2 dr.

To be given in a pint of ale, beer, or warm water."

Jaundice, or Yellows.

This disease may be known, principally, by yellowness of the eyes and mouth; a dull or languid appearance, and debility; a loss of appetite too is a common symptom. It may be distinguished from the former disease by the costiveness, which uniformly attends it, and by the animal appearing to be in more pain. At the commencement of the disorder a cure may generally be accomplished, by giving the warm laxative, directed for the foregoing complaint, and repeating it after an interval of five or six days, giving, in the intermediate time, the following drink, every morning and evening.

Castile soap	1/2 oz.
Venice turpentine	1 oz.
Ginger	3 dr.
Powdered gentian root	1 oz.

Rub the soap and turpentine together, in a mortar, until they are incorporated; then add, gradually, a pint of water, and afterward the ginger and gentian.

In the more advanced stage of this disorder, the liver is generally so injured as to render a cure impossible.—*White's Treatise.*

Mr. Lawrence observes that "this disease in cattle originates in hepatic, or liver-obstruction from cold; however, always from obstruction, which is most effectually opened by mild mercurial purges, notwithstanding the beast may appear weak and hide bound. The yellow tinge in the eyes and mouth, and upon the urine, sufficiently indicate the disease. Take the patient to the house, the earlier the better, and if he remain weak after two or three days, give steel beer, milk warm, a pint twice a day for a week, and good keep. One gallon good beer, three or four ounces iron filings, infuse in a stone bottle corked up three or four days; shake daily. Hard labor during great heats was said by the old writers to produce the Gall or Overflow of the Gall, which often terminates in the Yellows."

From the American Farmer.

Communicated for publication in the American Farmer, by order of the United Agricultural Societies of Virginia.

On Fallowing for Wheat—on gathering and cleaning Clover Seed, &c. &c.

DEAR SIR,

I should have replied to your letter immediately on receipt of it, had not sickness prevented it. I am now better, and shall give such an answer to your inquiries as my experience and observation enable me to do, without promising you any thing, either new or important, on the subject.

Your first inquiry on the subject of land intended to be fallowed, is, "whether I think it necessary to introduce the scythe or the hoof previous to the first ploughing, or whether I do not think it practicable to obtain equally good crops, from land where the whole mass of vegetable matter has been turned under."

In answer to the first part of this inquiry, I will observe that it is not necessary to use the scythe, or to pasture the land previous to ploughing, provided impediments to good ploughing do not exist in the soil, such as stones, stumps, &c. and the mass of grass or other vegetable matter is not too rank for the plough to subvert or completely turn under. If it can be effectually buried by the plough, the more vegetable matter is ploughed in the better for the succeeding crop, and the more fertilizing to the soil. But when this plan is adopted, it is necessary to sow the wheat or rye upon a single ploughing, and harrow in the seed. The former system pursued throughout Pennsylvania and this Valley, is generally exploded. Instead of breaking the fallows early in the spring, stirring them once or twice during the summer, and again in the fall at seeding time, the more economical and better plan is adopted, of suffering the field to lie in grass during the summer, either for hay, pasture, or to be ploughed in, in toto, where the land was poor and required such aid. But in this case care is taken not to disturb the sod or vegetable mass deposited beneath the furrow. The ploughing is done in August or September, and after lying two, three or four weeks, to meliorate by exposure to the influence of rain and air, the seed is sown and harrowed in lengthwise; that is in the direction of the ploughing. This is done in order to prevent the harrows turning up the sod. The harrows to be large and weighty, with strong, sharp, iron teeth. Those I use are $4\frac{1}{2}$ feet square, with 21 teeth, 12 inches long, $1\frac{1}{4}$ inches square, and projecting below six inches. If a single harrowing does not reduce the surface to a good tilth, it may be harrowed again, and the second harrowing may cross the first, if it is found not to disturb the sod. The mass of vegetable matter now buried beneath the surface, and excluded from the influence of the air, will perish, and soon enter into the incipient state of fermentation, and afford both warmth and fertility to the roots of the grain.

This system of husbandry is applicable to such soils as are sufficiently loose and friable to crumble before the harrow, fifteen or twenty days after ploughing. It is not adapted to stumpy or stony land, or such as is so stiff or tenacious that it cannot be reduced by a single ploughing and harrowing. But as it is a pecu-

liar property of clover to meliorate the soil, it rarely happens that land clothed with a thick crop of it, two or three years, does not lose its accessive adhesiveness, and crumble before the plough. Few plants so easily enter into a state of decomposition, and disengage so much carbonic acid gas, as clover; but as all plants or grasses do, in a greater or less degree, they must all contribute to the fertility of the soil, if ploughed in. Some of our perennials are subdued with difficulty, and decompose slowly, and none more so than the blue grass. It is necessary that this grass should be *completely turned under*, and not again disturbed by the plough, if intended to be sown in wheat, unless the first ploughing had been done during the winter. In that case, stirring the land in the spring, and again in the summer, would be advisable. The amount then, of what I have said on this subject, is, that the more vegetable matter is *turned under the furrow*, the better; but that it is absolutely requisite that it should be completely buried, especially blue grass, and not again brought to the surface by stirring with the plough or cross-harrowing. If the grass is too rank to be ploughed in, (even with the aid of a long chain attached to the beam, to prostrate it before the coulter) it will be better to use the scythe.—Clover may be mown in September, when brown, and reserved for feed. In this case it will be unnecessary to sow clover seed the succeeding spring.

Your next inquiry relates to gathering and preparing clover seed for market. The management of this requires a judicious attention to the order in which the clover is, when put into the barn or stacks, and the state of the weather when the seed is to be separated from the pug or chaff, which envelopes it. If the clover is mown, it should be quite brown (or black) before it is cut, and immediately raked into winnows or small heaps, and suffered to lie exposed to rain or dew, until the sap and juices of the plant have mostly evaporated. It must then, when in a dry state, be hauled into the barn or built into good ricks, and there remain until January or February, when the air is cold and in its driest state. The heads are then to be detached from the straw by threshing with flails, and using rakes. This is an expeditious part of the process, as the heads separate with great facility. These heads are then placed in a ring, on a good tight floor, and tread with horses until the whole mass is reduced to a fine powder, resembling scotch snuff.

If the seed is good and perfectly dry, and the weather in that state which would make tobacco crumble into powder, by handling it roughly, six horses may tread out ten bushels in a day:—but if the weather is humid or even giry, (as the tobacco planters term it) this quantity cannot be got out, with the same force of hands and two horses, in two days. Tobacco, in this case, affords an excellent hygrometer to ascertain the proper state of the air for this operation. To prevent the dust, which rises during the treading, becoming both offensive and injurious, it is proper to keep open the barn doors, and permit a free passage of air. Shovels must be kept employed to throw up the clover chaff, and confine it to the ring traversed by the horses.

The next operation is to pass it through a common wheat fan, turning it very slowly, and preserving the chaff which falls nearest to the

riddle, as that contains seed not yet detached from the pug. This may be trod a second time or sown in that state. What passes through the fan must now be riddled through a cockle riddle, and lastly through a clover riddle, (easily obtained in Baltimore or Philadelphia) which will permit the seed, and that only, to pass through. This last operation will generate some dust, which (if the seed is for market) may be thrown off by passing it once more through the fan.

But if you use a machine for collecting the clover heads, suffer them to lie in heaps, formed like a hay cock, two or three weeks. During this time they will undergo a slight degree of fermentation and heat, (of course,) which, after getting thoroughly dry, will greatly facilitate the operation of treading out the seed.—Let this be done, as in the other case, in cold dry weather.

I have now, Sir, treated the subject of your request pretty diffusely, as it was your wish that I should be minute; and if any information is communicated, from which you can derive instruction or advantage, it will afford me pleasure to have contributed thereto.

I am, Sir, with respect,

Your very humble servant,

R. P. BARTON

GEORGE E. HARRISON, Brandon.

Springdale, July 22d. 1820

From the American Farmer.

Laticauda or Tunisian Broad Tail Sheep, are emphatically the Farmers' Sheep.

Belmont, near Philad. Jan. 5th, 1823.

DEAR SIR,

I was mortified to perceive in a late "*American Farmer*," that you had been unsuccessful in your pair of *Tunis Sheep*; which had neither answered your expectations as to their capacity to pro-create, nor in the quality of the wool.—These forbidding defects, especially the former may tend to discourage our farmers in their endeavours to obtain and multiply this valuable race. Mr. Jefferson's account of his sheep would corroborate the idea that your sheep were not singular. I should be sorry, indeed that such opinions should prevail generally; although I cannot entertain any doubts of the facts you state, I must confidently repeat my former assertions, as to the generative and all other faculties of this race of the *Laticauda*, from my experience of, and personal attention to them, for a period of fourteen years. I never had, or heard of, a similar failure in any of the sheep, whereof I have given an account in our second volume of *Memoirs*. In my early life, I had a fine flock of English and other sheep—finer animals of the kind, I have never since seen. I spared no care or expense in relation to them; and was then well acquainted with the qualities and modes of treatment of these valuable parts of our farm stock. I paid, at one time, a sum for four South-Downs, which, although trifling, compared with modern prices, was accounted a most extravagant expenditure. I mention this circumstance, merely to shew my early and long acquaintance with the subject. I must confirm, without hesitation, all I have said, both as to the qualities of the Tunis Sheep, and the superiority of the wool. Many of my sheep bore fleeces not only far more abundant, but incomparably

more valuable than those of the best common sheep. Some of the fleeces would bear two, and some three cuts in the length of the wool. That next the pelt was *furry* and soft; so that I have had gloves and stockings made of it, equal to fleecy hosiery. I have had better cloth made of this wool, when judiciously selected, than I could obtain from that of common sheep, by many degrees. *Morinos* were then unknown. As to their prolific capacities, no doubt can be entertained, *provided* the right kind be procured. In this I may have been peculiarly lucky; yet I am satisfied that enough of the same class can be obtained, by careful and intelligent persons.—Where are there any other breeders which would produce a lamb at twice the age of those here? My *Selima* yeanned a healthy lamb in her *sixteenth* year. All of the race may not do this—but all I have known retained fecundity much longer than any other race of sheep.—Their freedom from all diseases incident to other sheep, may have assisted this natural perfection. They yeanned with much more ease, and few if any casualties occurred in lambing.—I have, now, none of this breed I can recommend.

Your pair may not be prolific, yet may be of good kind, except as to the wool. How many pair of comely and promising Bipeds do we see, without progeny? Were we to generalize such instances, we should tremble under the apprehension that the human race would cease to *increase and multiply, and replenish the earth.* *Malthus'* alarms would then be nugatory indeed.

In my account of the Tunis sheep, vol. 2d, page 221, I relate the difficulty of a Tup of the common kind, coupling with a Tunis Ewe. But no such difficulty is experienced either with a common ewe, or with a female *Laticauda*. Nature is too wisely directed, to permit any impediments to their intercourse. I would not be understood to say, that the Tunis fleece is comparable to that of really fine woolled sheep. But its abundance, its not being deciduous, and its applicability to all common uses, for which fine wool is unfit, far overbalance its inferiority in his regard, and entitle this singular animal, emphatically; its superior carcass, too, considered: to the appellation of the *Farmers' Sheep*.

In some instances of apparent incapacity, I have succeeded by changing the male, or the female, as the case required. This I have practised with cattle, as well as sheep.

I have been, at several periods of my life, a breeder of sheep and cattle, and have had as fine animals as most I now see. The English breeds were then not so highly improved, as they are now esteemed to be. We procured our breeders chiefly from Holland, the low countries of Europe and Germany. Save that the *Alderney* race were always in high estimation. I had them, during twenty years, in great perfection. I never found much certainty in breeding great *milkers*, even from the best parentage; though often I have had success. My farms have been chiefly devoted to large dairies, during more than forty years past.

My days of agricultural activity have passed away, and I can now only enjoy recollections; and also the gratification of seeing my early endeavors now far exceeded. I rejoice to perceive the spirit for improving our stock, so generally and meritoriously diffused; and am significantly delighted by its prevailing where it was most required.

I, at one time, was seized with a zeal for breeding of *Horses*. In 1777, when the British took possession of our city and its environs, I had a number of high blooded young Colts, which I failed in having driven off from one of my farms. Ten or eleven of them were shot down by the Hessian or Yager banditti, for their skins. This was a damper to my equestrian propensities. When I returned to my domicile, I found my farm near the city, desolated and temporarily ruined—houses and farm buildings all burnt; and all enclosures and much forest timber taken away. Yet the wanton destruction of the young horses, and the barbarian and merely mischievous prostration of an extensive and well selected collection of fine, young and thriving fruit trees, mortified me more than the more important deprivations. Added to weightier excitements to avenge my *rebellious* exertions, an illiberal officer of a British picket, was stung by an imprudently smart girl, who remained with her widowed mother in the farm house. He sarcastically told her, that "*Washington* had been a low mechanic."—She replied that she had never heard that part of his history—but *their* General, *Howe*, was assuredly one—he was a *Whig-maker*. The house was burned in a night or two after.

But, as a mark of *good breeding*, I will close my prosing letter, which I began only to rescue my favorite Tunisians from unmerited imputations. My subject is, however, not a *barren* one. You will, therefore excuse my prolific prolixity, and permit me to offer you sincere assurances of my best regards.

Your's, very truly,

RICHARD PETERS.

J. S. SKINNER, Esq.

From the Manufacturers' (Providence) Journal.

LACE LOOM.

We learn with pleasure, that the LACE LOOM, the construction of which was commenced about two years ago, on account of Messrs. Walker & Bestwick, of Medway, Mass. has been at last completed, at an expense of more than \$2000. The width of this machine, within the shuttles, is 56 inches. The shuttles are 1230 in number, and all play at one time, abreast of each other, with the same number of warp-threads. The warp threads are prepared on 26 bobbins, to which the machinery gives two motions, one a vertical rotary, to unwind the warp—the other a horizontal rotary, to turn the bobbin endwise; so that the warp runs two ways at once. The frame receives 26 breadths of lace at once—each having a selvage, and being held to the breadth on each side by a single thread, drawn through the adjoining meshes, as the work proceeds. When the piece is finished, these single threads are withdrawn, and the lace is divided into the requisite number of pieces.

The machine has three treadles and four handles, and is moved by the labor of one man. It occupies about as much space as a common Scotch Loom. It is so complicated that its proprietors think no intelligible draft can be made of it.

A piece of lace 23 yards long and 56 inches wide, from this loom, weighs twenty-two ounces and an half. This thread is No. 180. In constant operation, the machine would employ about sixty persons, mostly females, to prepare the lace for the market.

Any persons desirous of examining the loom, may see it, by calling on the proprietors, or on John Bestwick, the weaver, Medway, Mass.—Lace manufactured by it, is for sale in Providence, by Messrs. Watson and Rathbone.

THE ART OF BOWING.

In all classes and professions there is something peculiar in the method of bowing. Who that has seen much of the lawyers but will acknowledge that he throws into his obeisance a considerable share of that gravity arising from the awful honors of the wig and the gown? But altogether, the bow of law is not greatly to be admired—it seems to be a compound of the lessons of the dancing master, and that sagacious sort of nod which is acquired by long practice in the courts of law, and which generally accompanies any particular display of the cunning advocacy. Whoever has been in the court of justice must have seen the senseless nodding of some bustling advocate while the judge was charging the jury—taking hold of any circumstance favorable to his client, as it dropped from the bench, and then, with infinite importance, shaking his head to the twelve men in the box, as much as to say, 'mark that!'—Now this is one of the worst uses to which such a head can be applied.

The bow of the courtier has too much of the drawing room about it, and looks too cold and formal. The English, in general, cannot be respectful without making the act of obeisance too long; the French combine brilliancy with grace, much better, are super-eminent with that kind of bend which combines condescension with self-importance.

The medical professions are notorious for the peculiar nature of their bows—they are generally accompanied with a turning up their eyes, and look which says, 'you are in a sad way, madam, but, no doubt, we shall soon set you right again.' Doctors always speak in the plural, and like authors, cannot do without the editorial royalism. I am not much in love with the physical bow; it smells as decoction of 'I'm glad to find you poorly, but would not have you worse,' and a few simples not worth mentioning.

Every body is acquainted with the bow of the shop keeper—It is good enough in its way, and not open to many objections, because it professes no more than it means—'always happy to serve a customer.'

The theological bow is ever best on Sunday, and nearer the church yard the better. I was never more impressed with the importance of this bow than when lately in a country church. According to the good old fashion which prevails beyond sixty miles from town, we were all in our pews before the minister arrived. The dignity of his appearance, and the consequential, although at the same time, parental expression that beamed from a rubicund, but intelligent countenance, created an involuntary sensation of respect. As he walked up the middle of the aisle, the congregation rose and welcomed him, the return which he made right and left, was in the best style of clerical bowing.

But the most distinguished on the list of bows is that of the military profession. It is so well known and so fully admired—by the younger part of your fair readers in particular—that any illustration would be superfluous.

FACTS AND OBSERVATIONS RELATING TO
AGRICULTURE & DOMESTIC ECONOMY.
FOR THE NEW ENGLAND FARMER.

ON NEAT CATTLE.

In early ages neat cattle, together with sheep and goats, formed almost the only property of men, who were reputed to be wealthy. Thus Abram was said to be "very rich in cattle;" the wealth of Lot consisted of "flocks and herds and tents." Of Nabal it was said "the man was very great, and he had three thousand sheep, and a thousand goats." Cattle became of somewhat less comparative consequence as society advanced in civilization; still there is nothing over which the knowledge, constituting power, has given man dominion of more importance than neat cattle, unless, perhaps, it be iron.

It is probable that cattle, and indeed all domestic animals, were originally existing in a wild state, and some are still found in a state of nature in different countries.

A kind of cattle, called by authors the *Urus*, or wild bull, was formerly a native of Great Britain and Ireland, as is proved by the horns of this animal, which have been found in the mosses and bogs of those countries. These horns are of great magnitude; and their size indicate that they belonged to the largest animal of the ox kind, that ever was found in Europe. The breed has been extinct in Great Britain and Ireland, from time immemorial; but still exists in the Polish province of Lithuania. It is described as having in general a curled shaggy coat, especially on the forehead; the hair constantly long on the fore quarters, neck and forehead, and depending from the chin; the neck elevated, thick and short, with the tail long, the eyes red and fiery; the horns thick and short. It grows to a large size, the female being larger than the largest bull of common breeds.

The *Bison* (*Bos Americanus*) is a large species of ox, with round and distant horns, which point outward, a long and woolly mane, and a large and fleshy protuberance on the shoulders.

These animals are hunted on the banks of the Mississippi and its tributary streams. Their flesh is used as food, and the fatty protuberance, in some large cattle, weighs forty or fifty pounds, and is esteemed a great delicacy. When the animals are in full flesh, they are said to yield, sometimes, as much as 150 pounds of tallow.

The largest breed of cattle hitherto discovered is found in the interior parts of India, and is there called *Arnee*. Dr. Anderson gives the following particulars respecting this prodigious quadruped.

"About the year 1790 or 1791, the Hawksbury East Indianman, on her voyage outward, while she was going up the river Ganges, and at the distance of about fifty miles below Calcutta, fell in with a bullock of this species floating in the river, and still alive. A boat was immediately hoisted out, which went in chase of this game: a noose was soon thrown across the horns; and it was dragged to the ship's side, hoisted on board, killed, cut up, and soon after dressed for the use of the ship's company, who found it a most delicious meal; being the first fresh meat that they had tasted for many months. They all thought it a very large sized ox, and were the more surprised at this particular when it was discovered to be only two years old.—When cut up, it was found to weigh three hundred and sixty pounds a quarter, making one

thousand four hundred and forty pounds of beef in the whole carcase. As this animal must necessarily be supposed to be lean at the time, for it must have floated, in all probability, many hundred miles down the river (none of this breed being found lower than about Plassy,) and must therefore have fallen off in flesh very much, we cannot compute that a full sized bullock of that breed, when thoroughly fattened, could have been less than three times that weight; so that the four quarters alone would have amounted to two tons; an enormous size for an animal of that kind."

In a work by Mr. Kerr, an English author, on the Animal Kingdom, this kind of ox is said to have been met with by a British officer, in the woods above Bengal; and to have been fourteen feet high, measuring from the hoofs to the top of the horns. It partakes of the form of the horse, the bull and the deer; and is represented as a bold and daring animal. It is said to have upright lunated horns, flat and wrinkled on their surface. It is of a black color, quite smooth, with no bunch or protuberance like that of the bison. The horns of these animals are to be found in European museums and cabinets. Some of them are said to measure three feet and an half in length, and seven inches diameter, at the base.

The *Arnee* is, perhaps, the largest breed of cattle yet known. A very small breed is found in Africa, of which we have the following notice in Dr. Anderson's *Recreations*.

"The smallest breed of cattle, which has come to my knowledge, I never yet saw; but it has been so accurately described to me by several persons who have seen and handled it often, that there can be no doubt that such a breed of cattle does actually exist. The diminutive creature to which I allude, was a bull, which, with a cow of the same breed, was brought by way of natural curiosity from some part of the western coast of Africa, as my information goes, to be presented to the Duke of Northumberland; but, unfortunately, the cow received a hurt on board the vessel, which caused her death. The bull came safe, and lived about Sion house, near Brentford, above eight years, being quite domesticated, and as tame as a dog. Mr. Forsyth, of Kensington, who was then gardener to the duke, assures me, that he has measured him often after he had attained his fullest size, and when he was enormously fat; and that from the ground to the top of the shoulder was precisely two feet. He was a neat, well formed, and beautiful creature of his kind. His horns would seem to have been rather longer in proportion, and finer than those of the ordinary bulls in this country, being three or four inches long and very sharp. Like all other *pets*, he became very familiar in the family. He used to accompany the brewer to the cellar, and came at last to relish a horn of good ale very well; and, after having satisfied himself completely, he used to take his place before the hearth in the servants' hall, from which it was not an easy matter to dislodge him. He became at length a little mischievous and troublesome to strangers, who came about the house, by some of whom, it was supposed, he had been so severely beaten as to occasion his death."

The *musk bull*, which is found in the interior parts of North America, between Churchill and

Seal rivers is another remarkable variety of the *Bos*, or cattle kind. This species is thought to have arisen from an intercopulation of the bison with the common kind, such as our domestic cattle. It is said to be somewhat lower but more bulky than the deer, with short legs, a small hump or bunch on the shoulders; the horns very large, weighing from forty to sixty pounds, bending downwards, and verging out at the points to the length of two feet and upwards; the hair of a dusky red color, fine, and long enough to reach the ground. Beneath the hair the body is covered with an ash colored wool or fur, so very fine as to make stocking finer than silk. The tail is about three inches long, and covered with hair, of which the Esquimaux Indians make caps. They are very prolific and numerous, delight in rocky and hill countries, have considerable speed, and climb steep ascents with much agility. Their flesh is esteemed good and wholesome food, notwithstanding its flavor of musk.

The *sarluc*, or grunting ox of Tartary and Thibet is a singular animal of this species. It is found in Tartary and Thibet, where it is numbered among the domestic animals. It breeds with the bison, and is accounted an animal of the same species. It has, however, some peculiarities not found in any other creature of the *bos* kind. Instead of lowing like an ox, grunts like a hog. Its body is covered with very long hair, which hangs down below the knees, generally black, excepting the ridge of the back and the mane, which are white. The horns are short, upright, sharp and slender; the tail is formed like that of a horse, but white and bushy. The animal, in its wild state, is very unruly and dangerous, and accustomed to strike or but with its head. The tail, being mounted in silver, is used in India for the purpose of driving away flies, and serves various purposes of ornament in Thibet and China.

(TO BE CONTINUED.)

Cisterns for holding rain water.

"The deeper cisterns are, the better water will be kept. A cube is a good figure, but double cube is better, as it gains depth and consequently coolness. A cistern of 6 cubic feet holds 16 hogsheads of 100 gallons each. A double cube of 5 feet would hold above 18 run hogsheads of 100 gallons. The pit should be dug exactly by square and plumb. On the face of the pit, lay potter's clay, plasterwise, with trowel, coat over coat, (as it dries and cracks two or three inches in all. Against this firm even face of plaster, raise the brick or stone work. Bed the bottom, three or four inches thick, with strong clay, beat to a smooth even surface. Moisten the clay, and beat it with switches or small hoop poles, but with nothing heavy. On this clay-floor, lay a double bed of brick; and, on the margin of this, carry up the side walls half brick thick, laying them in terraces. Cover the cistern over, but leave room to fix a small pump, which must be two feet from the bottom; or a roller and bucket may be used to raise the water."—*Bordley's Essays*.

"The following valuable composition for a cement for water cisterns was given to the editor [of the Domestic Encyclopedia] and he has used it with success. He lined the well with brick, and left a space of about six inches be-

tween the bricks and the surrounding solid earth; this space be filled with mortar made with lime and pounded gravel. Equal parts of pounded brick, sand, and sifted stone lime, were well mixed and worked up with hot lime wash. This composition was spread on as hot as possible upon the inside of the well.

"To prevent the cooling of the cement too hastily, only a gallon must be made at a time.—A floor of the cement must be laid, and the top arched, leaving room for a pump to be put down."

"In many parts of Europe, rain water, saved in cisterns is the only water drank. Stolberg says, he drank some in the vicinity of Naples, near three years old, and found it excellent.—Mr. Brentham has lately taught us, that water may be kept during the above period perfectly sweet. On the flat coasts of the United States, these rain water cisterns ought to be generally built; for the water from the ground is very bad, and occasions many of the disorders, attributed to other causes."

It is said, by some, that if the bottom of cisterns be covered with sand, it will help to sweeten and preserve it.

"Anciently there were cisterns all over the country in Palestine. There were some likewise in cities and private houses. As the cities for the most part were built on mountains, and the rain fell regularly in Judea at two seasons of the year only, in spring and in autumn, people were obliged to keep water in cisterns in the country, for the use of their cattle; and in cities for the convenience of the inhabitants.—There are cisterns of very large dimensions to be seen at this day in Palestine, some of which are 150 paces long, and 54 wide."

There are many tracts of country within the limits of the United States, where the water is brackish, hard, and unwholesome; and where, of course, it would be well for the inhabitants to turn their attention to the construction of cisterns for holding rain water, which, if well preserved, is always pure and wholesome.

Implements of Husbandry.

"In purchasing implements of husbandry, the following rules are to be observed: 1. They should be simple in their construction, that their uses may be easily understood; and when necessary, that any common workman may be able to repair them. 2. The materials should be of a durable nature, that the labor may be less liable to interruption from their accidental failure. 3. Their form should be firm and compact, being so much subject to jolts and shaking. 4. In the larger machines, symmetry and lightness of shape ought to be particularly attended to: for a heavy carriage, like a great horse, is worn out by its own weight, more than by what it carries. 5. The wood should be cut up and placed in a position the best calculated to resist pressure; and mortises, so likely to weaken the wood, should, as much as possible, be avoided. 6. Their price should be such, that farmers in moderate circumstances can afford to buy them; yet, for a trifling difference, the judicious farmer will not purchase articles, either of a dimsy fabric, or a faulty form; and 7. Implements ought to be suited to the nature of the country, whether hilly or level, and more especially to the quality of the soil, since instruments calculated for light land, may not answer well in the heavy and adhesive."—*Code of Agriculture*

From the Northern Intelligencer.

DISEASES OF SHEEP.

As far as I have learnt, it has been but a few years since worms have been discovered to breed in the heads of sheep, though it is probable they have, from time immemorial. They are not only found in the heads of sheep but also in the deer of our forest.

I am fully satisfied that these grubs do more injury to the sheep of our country, than all the diseases with which they are afflicted, and we may add to this, all that are killed by dogs and wolves. I therefore consider that a true history of these worms, their manner of breeding, together with the best method of destroying them, will be important to the public, especially at this time, when our farmers are so generally turning their attention to the breeding of sheep and supplying our infant manufactories with wool.

1st. These grubs proceed from a large bee, which lays its eggs in the nostrils of sheep, the last of August and first of September, where they soon hatch, so that by the 20th of the month, you may discover in the cavity between the nostrils and the wind pipe, from 25 to 100 small white grubs, with black heads and a black streak on the back, and in June a black streak crosswise. They continue in this place till July and August, at which time they get their growth, and are as large as a pipe stem, and near an inch long, with four large teeth as hard as bone. They then leave the sheep, and soon cast off their skin, when the bee appears, and is ready to lay a new parcel of eggs.

Symptoms.—The symptoms do not appear till towards spring, at which time they may be discovered, by sickly countenance and loss of flesh, notwithstanding all the grain and roots that can be given them; sometimes running at the nose, (though not always,) and snorting as if trying to blow something from the head. In some instances they will suddenly spring about in a wild frantic manner, and drop down dead. When this last symptom takes place, the grubs have made a lodgment in the brain. When they do not die in this manner, the grubs make the sheep so poor that their wool stops growing, becomes loose and much of it falls before shearing, many of the lambs are lost, and those that live are stunted by reason of the ewes being poor and sickly, and consequently give little or no milk; sometimes the sheep will linger along, pining away continually, and not die until June or July.

Remedy.—Take half a pound of good Scotch snuff, pour two quarts of boiling water on it, stir it and let it stand till cold, inject about a table spoonful of this liquid and sediment up each nostril of the sheep with a syringe. This must be repeated three or four times at proper intervals, from the middle of October to the first January; the grubs are then small and are much easier destroyed than afterwards, and have not injured the sheep as they will, if deferred until later. Half an ounce of assafoetida, pounded in a little water, and added to the snuff, will make it more effectual. The owner of the sheep need not be alarmed when the operation is performed, to see the sheep very drunk and apparently in the agonies of death, as they will in a few minutes recover. I never knew any bad effects to follow. Dry snuff may be blown

up the nose with a quill, and have a good effect; but it is a tedious dirty job. I have tried vinegar and blue die with but little or no success.

The reason why it is necessary to perform the operation so often is, that in the heads of the sheep, there are many cavities, and a little above each nostril there is a thin substance wound up into four folds, the grubs get into these cavities and folds, where it is not common to reach them the first operation, but by repeating it three or four times, at proper intervals, they will crawl out and be all destroyed. The reason of my directing the sediment of the snuff to be injected, together with the decoction, is, the sediment is retained in the head longer than the liquid, which makes it more certain to prove effectual.

The above knowledge I have obtained from dissecting the heads of a number of sheep, in different seasons of the year, and making experiments on some before they were killed, and in this way I could discover exactly the effect of the different medicines.

If the above directions are strictly attended to with all the sheep of our country, more than a million of dollars would be saved in the United States yearly; as all sheep (in this part of the world at least) are infected with these vermin; if any person doubts it, let them examine sheep from the 20th of September to the first of June.

I have found that our sheep are sometimes infected with the consumption on the lungs.—Bucks that have been put to too great a number of ewes, without being well fed with corn or beans, a little before tupping time, are most subject to this disorder.

Symptoms.—The eyes uncommonly bright and shining, water constantly running from them, and a gradual loss of flesh, they generally decline till the latter part of the winter and then die. I lost a buck last winter with the above symptoms, and on dissection, I found every part natural except the lights, which were nearly all ulcerated.

Remedy.—Tar, or tar water is good, but after the disorder is fully seated, it is doubtful whether any thing will be of service.

Foot rot.—This disorder is occasioned by sheep going in wet pastures. There is an issue in the division of each hoof, a little above the hoof, some have erroneously supposed it to be a living worm. When the sheep stand long in water, it affects the issue of their feet, so that an inflammation takes place, and if they are not removed to a dry pasture the feet will rot off.—Perhaps it would be better for those, whose land is low, to take out those issues, which may be easily done, by putting the finger the under side of the foot and pressing upward, then with a sharp penknife cut through the skin around the mouth of the issue, and with a strong pair of tweezers it may be pulled out, the place will then heal and the sheep will not be liable to the rot in the foot, though they should run in wet pastures. But when the pastures are dry, which on the whole, is best for sheep, I think it not proper to pull out the issue: for this reason, the God of nature has made them thus, and undoubtedly for the benefit of the sheep, as much as the issue in the legs of hogs.

JNO. T. ADDOMS.

Plattsburg, Oct. 10, 1822

From the New York Statesman.

Extract of a letter from one of the Editors, now in Washington.

NATIONAL BURYING GROUND.

One of the first objects for which I inquire on entering a new place is the church yard, since independent of the pleasing melancholy derived from meditations "among the tombs," the selection of a site for a burying-ground, the manner of laying it out, the sculpture of the monuments, and the inscriptions they bear, furnish a pretty correct index to the intelligence and taste of the inhabitants. In the congregation of the dead, you may study and catch the manners of the living, discovering in turn refinement or rudeness of taste, knowledge or ignorance, ostentation or modest retirement, affectation of sorrow, or the simplicity and sincerity of real affection and real grief. Had Mr. Alden been less voluminous and less indiscriminate, his collection of epitaphs might have been an interesting and useful work, presenting at least one striking feature in the moral physiognomy of the country.

It was my intention sooner to have given a brief sketch of what may be considered the *National Burying-ground*, as members of Congress and other officers of the government are there interred. I have paid it two visits—the first at evening twilight, in company with the obliging friend, alluded to in my last letter, and an English traveller. We arrived in season to take only an imperfect view of the ground, and to read a few of the inscriptions before the departure of day-light, all the horizontal monuments being covered with snow to the depth of several inches. Yesterday morning I walked there alone, and passed an hour before the meeting of the House.

This cemetery is in a remote and lonely situation, being something more than a mile in a southeasterly direction from the Capitol. It lies immediately upon the bank of East Branch, at the distance of only a few yards from the water's edge, but elevated considerably above it, and commanding an extensive view of the river. The winding path leading to it is over a wide and barren common—there are no houses in the vicinity—and it will be long before it will be in the midst of the city. Had the church-yards of New-York been laid out with the same precaution, they would not now have formed a subject of legislation for the Common Council, nor for newspaper discussion. This grave-yard contains an area of two or three acres, enclosed by a plain wooden fence, and sprinkled with corpses of native cedar, stunted in their growth and many of them withered, either from the poverty of the soil, or from having their roots broken by the spade of the grave-digger. There are however, enough living to conceal many of the graves; and their verdure contrasted with the grey tomb-stones produces an agreeable effect.

The most conspicuous monument, is that erected in memory of George Clinton, Vice-President of the United States. It is a handsome pyramid of stuccoed freestone, ten or twelve feet in height, standing upon a broad base, and mounting by steps. On one side is a profile likeness cut from marble in bold relief, and surrounded with a civic wreath. Beneath is the following inscription: "To the memory of George Clinton.

—He was born in the state of New-York on the 26th July 1739, and died in the city of Washington on the 20th of April, 1811, in the 73d year of his age. He was a soldier and statesman of the revolution. Eminent in council and distinguished in war, he filled with unexampled usefulness, purity and ability, among many other offices, those of Governor of his native state, and of Vice-President of the United States. While he lived, his virtue, wisdom, and valor, were the pride, the ornament and the security of his country; and when he died, he left an illustrious example of a well spent life, worthy of all imitation. This monument is affectionately dedicated by his children."—I have copied the whole of this inscription, because it is concise, neat and appropriate, and because I do not recollect to have seen it noticed. The virtues and services of such a distinguished patriot cannot be too often called to mind, especially by the citizens of a state to which he was a public benefactor.

Near the grave of George Clinton, commences a range of monuments, which extends for some rods towards the south, erected to the memory of members of Congress, who died at Washington. These memorials are placed in an exact line, are of the same height, composed of the same materials, uniform in their structure, and uninterrupted in the series, except by a marble pyramid in honor of Capt. Hugh George Campbell, of South Carolina. They are built of free stone, painted white, and consist of short, square, and plain pillars, with a cone at top, and resting on a broad pedestal which rises by two steps. On the face of the pillar, is an inscription, similar throughout, with the exception of names and dates. I shall give that of Mr. Pinkney as a sample, because he is among the most distinguished in this assemblage of the dead, and because it is a perfect contrast to the epitaphs proposed by several persons soon after his death. In plain black letters you find the following brief inscription:—"In memory of the Hon. William Pinkney, a senator in the congress of the United States from the state of Maryland, died Feb. 25th, 1822, aged 53 years." Here sleep the remains, and such is the epitaph of the man, on whose eloquence courts and senates have hung with admiration and delight. By his side and near him, sleep the ashes of Mr. Trimble of Ohio, Mr. Burrill of Rhode Island, Mr. Malbone of the same state, and Mr. Tracy of Connecticut, members of the Senate—together with Samuel A. Otis, former secretary of that body; also, Mr. Smilie of Pennsylvania, Mr. Dawson of Virginia, Mr. Stocumb of North Carolina, Mr. Hazard of Rhode Island, Mr. Walker of Kentucky, Mr. Mumford of North Carolina, Mr. Stanford of the same state, Mr. Brigham of Massachusetts, Mr. Darby of New Jersey, and Mr. Blount of North Carolina, members of the House of Representatives, making an aggregate in both branches, of seventeen. It is somewhat remarkable, that so large a state as that of New-York has no other representative in this congress of the dead, than George Clinton, while the small state of Rhode Island has three or four. In the monuments and tomb-stones of other persons interred here, there is nothing very peculiar or striking, if you except the marble slab over the remains of Tobias Lear, which "his desolate widow and mourning son erected to mark the place of his abode in the city of si-

lence," and a plain tomb-stone to the memory of Mr. Machen, with the classical and beautiful expression of filial affection, "Hoc! genitorem, omnis curæ casusque levamen, Amitto."

THE FARMER.

BOSTON:—SATURDAY, JAN. 25, 1823.

FATTENING OF SWINE.

The Hon. Mr. Peters, of Pennsylvania, has asserted that fattening hogs should always be supplied with dry rotten wood, which should be kept in their pen, for the animals to eat as their appetites or instincts may direct. It has been supposed, likewise, that swine thrive better when they can obtain fresh earth, which they are observed often to swallow with greediness. The probability is that nature directs these creatures to the use of such substances as absorbents to correct the acidities of their stomachs. Charcoal, it is said by some, will answer a similar, if not more valuable purpose; and that if swine are supplied with this last mentioned substance they show but little inclination for rooting, and are much more quiet in their pens than under ordinary treatment. It is easy to try the experiment; and if tried we should be glad to be informed of its results.

Mr. Peters, and some other eminent agriculturists have asserted that food for swine is much the best for fattening them, when it has been soured by fermentation, and it is even supposed that one gallon of sour wash will go as far as two of sweet for this purpose. And an English writer tells us that "the best method of feeding all kinds of grain to hogs, is to grind it to meal, and mix it with water, in cisterns made for the purpose, in the proportion of five bushels of meal to a hundred gallons of water; the mass to be well stirred several times each day, until it has fermented and become acid, when it will become ready for use. In this way two or three cisterns must be kept for fermenting in succession; and the profit will pay the expense."

Hogs cannot be fattened so cheaply in very cold as in temperate weather, unless they are guarded with great care against the inclemency of the season. In the winter too, acid or fermented food cannot so well be procured for them, as the low temperature of the air will stop fermentation, if not freeze the wash under ordinary circumstances. The food for swine may be fermented by being kept in an apartment kept at near summer heat by a stove. The wash may also be kept warm by steam introduced according to Count Rumford's plan.* But heating liquids by steam is not so easy a process as would seem at the first thought. There must be a large [that is large in proportion to the quantity of liquid to be warmed] and strong boiler, with two safety valves, one opening outwards to let out the steam, if by the sudden increase of heat, it should acquire so much elasticity as to endanger the bursting of the boiler; and one valve opening inwards to prevent the sides of the boiler from being collapsed, or crushed inward, or the liquid from being forced out of the cistern through the steam tube into the boiler by the weight of the atmosphere. Then there must be steam tubes rising some height above the surface of the wash in the cistern, and descending, vertically, to near its bottom. The steam must be so elastic as to overcome not only the pressure of the atmosphere, but also the additional pressure of that part of the liquid in the vessel, containing the wash, which lies above the opening or end of the tube where the steam is discharged into the vessel.

* See *New England Farmer*, No. 5, pp. 38, 39.

Various means may be made use of to give the wash a temperature conducive to fermentation. Water-tight tubes filled with flame or hot air, from a furnace or a stove, might answer the purpose by being carried thro' the cisterns containing the wash to be fermented. But for common farming purposes, we believe it will be best either to keep up a moderate degree of heat in the room or cellar in which the wash is kept for fermentation, by means of stoves, or to make use of kettles or caldrons set in brick in the common way, in which after the materials have been well boiled, the liquid must be kept of a proper temperature for fermentation, by occasionally heating them. Wooden vessels, or circular rims of wood, may be so adapted to the tops or rims of these kettles, that the whole will contain three or four times the quantity, which the kettles alone would hold. In these roots and other food might be boiled, steamed and fermented, at the will of the owner or superintendent of the process. Where fermentation is the object, it may be well to mix with the sweet wash a little of that which is already soured, to serve as yeast or leaven.

FARMER SUMMARY OF NEWS.

CONGRESS, for aught we can perceive, are proceeding pretty correctly, and do not appear to be much affected with a certain *endemic* disorder, which used to break out in speeches of more length than substance. To give a detail of their proceedings in our paper, without encroaching on our other provinces, would require rather more talent than is necessary to compress an *liad* into a nut shell. We shall therefore merely ejaculate a *sheep's eye* towards them, occasionally, without pretending to give a regular survey of their proceedings. There is some prospect of their abolishing imprisonment for debt—of their amending the Constitution relative to the election of President, in such manner that in certain cases the House of Representatives shall choose one of the two highest candidates. They have still on the carpet certain resolutions relative to national defence, and organizing the militia, which, when hammered into a workmanlike shape, we shall perhaps present to our readers. They have a bill for regulating the commercial intercourse with Canada, which will probably prove interesting to those whom it may concern. Some wagon loads of private petitions go likewise to swell the national budget of proceedings. A new naval peace establishment is also in contemplation. They seem determined that Uncle Sam shall not be taken in by gentlemen who possess more wit than honesty, and have therefore under the national thumb "an act in addition to an act for the more prompt settlement of public accounts, and for the punishment of perjury." An amendment of the Constitution is proposed to give Congress power to establish and construct roads and canals. This some suppose will be merely confirming a power already given by the Constitution.

MASSACHUSETTS LEGISLATURE is mostly occupied by business of a private and local nature. They have before them, an act for the sale of certain lands in Maine, which they must, according to the act of separation, either transfer to that state or pay her \$30,000. Likewise, a bill authorizing towns not exceeding a certain amount of population, to employ schoolmasters, who are not versed in Latin and Greek. Moreover, the financial prospects of the Commonwealth appear to *look a little blue*. According to a report from the committee of Ways and Means, exhibited by Mr. Jarvis, it should seem that the annual revenue for a number of years is likely to be at least \$35,000 dollars short of the annual expenditure, and this deficiency it is proposed to supply by a tax on auctions. The session, however, appears to be characterized by that harmony and dispatch of public business, which bids fair to promote the public welfare, and assure the approbation of their constituents.

FOREIGN.—The last news from Europe brings London dates to Dec. 7th; Paris dates to the 4th Dec. Madrid to the 25th, and Verona to the 26th November. The Congress at Verona is dissolved. An official remonstrance has been or will be dispatched to the Cabi-

net of Madrid, demanding such an alteration in the Constitutional system as will at least render it analogous to that of Portugal, and place the crown beyond the reach of popular control. In case of refusal, (says a London paper) Russia, Austria and Prussia will give their fullest sanction to the hostilities, which the Ultras of France are so anxious to commence—and there is no doubt that the army of observation will soon cross the frontier. England is not to be a party to the measure, unless the Constitutionalists show a determination to put the king to death, or to invade other countries. The Russians are said to be hostile to Spain.

The Greeks are to be left to the good will of the Turks, who have promised to behave with moderation. This, a London editor remarks, is the most fearful of all political farces, as it is delivering the lambs to the tender protection of the wolf.

A London article of Dec. 7th, states that the Duke of Wellington is hourly expected at Paris, and it is reported that the French Government's determination, in regard to Spain, is suspended until the arrival of the Duke.

A letter received in London from St. Petersburg, states that Capt. Waschew, just returned from his voyage of discovery, had not only passed up Behring's Straits, to a higher latitude than Capt. Cook, but had determined the true position of the northern continent of America, from Tey Cape to Alaska, and found an island north of it inhabited.

A widow woman, of Vannes, in France, was murdered on the 20th of October last. When discovered, she still grasped in one hand some locks of hair, which, in struggling she had torn from the head of the murderer, and which led to his arrest.

DOMESTIC.—The President of the United States has ratified the Convention made at St. Petersburg, relative to indemnifications for slaves carried off by the British during the late war, by proclamation dated the 11th inst.

The Hon. H. G. Otis, L. L. D. has been elected Member of the Corporation of Harvard College, in place of the Hon. John Lowell, L. L. D. resigned.

Literary Prizes.—The prize awarded by the managers of the Philadelphia Theatre to Mr. Sprague, for his address, delivered at the opening of the Theatre in that place, is a handsome silver cup, of neat workmanship, bearing on one side, the inscription *Audique vocatus Apollo*, and on the other "Presented by Warren and Wood, to Charles Sprague, Esq. of Boston, author of an Address delivered at the opening of the New Theatre, in Philadelphia, Dec. 2, 1822." Mr. Sprague, some time since, received from the managers of the New York Theatre, a large gold medal, with appropriate inscriptions.

Important Invention.—We find it stated in one of our last files of English papers, that a Mr. Cook, of Birmingham, has discovered a method of rendering all sorts of cotton, linen, muslins, &c. (as well as timber itself,) incombustible, by immersing them in a solution of vegetable alkali.—*Even. Gaz.*

David Sears, Esq. has presented to the Mayor and Aldermen of the city of Boston, a handsome edifice built for a vegetable market, and situate in Brattle-st. It appears by the deed (says the Boston Patriot) that he presented to them six hundred shares in the corporate property of the Museum Hall Corporation, the net income of which is annually to be funded, and one half the income of the fund is to be applied to embellishing the Common and the Mall, and to such other ornaments of the city, as the Mayor and Aldermen may think proper. Under the municipal regulations of the Market this fund will annually increase, and finally yield a large revenue.

The Hon. Nicholas Brown has presented to the Corporation of Brown University, Providence, an elegant brick building, 4 stories high, 120 feet long, 40 wide, containing 12 rooms.

Trask, a criminal, who has been confined in gaol in this city about a year, and lately murdered two persons immured in the same cell with himself, made his escape on Tuesday night last, by removing one of the stones from the wall of the prison.

A man by the name of Echert, was killed on the 1st inst. in Penn. by the discharge of a gun. It had been loaded a long time, and in attempting to set fire to the powder it contained, with a lighted coal, it was discharged and shattered his head to atoms.

DIED.—In New Haven, on the 12th inst. the Hon. JONATHAN TUCKERSON, LL. D. Governor of Connecticut. In Canandaigua, N. Y. Hon. GIDEON GRANGER, formerly Post Master General.

On board the ship *Moss*, on the 27th October, on its passage from Philadelphia to London, Hon. WILLIAM LOWMEYER, of South Carolina.

In Brunswick, N. J. Gen. JAMES W. RYAN, at the advanced age of 107 years.

FOR sale at the Agricultural Establishment, No. 30, Merchant's Row, a general assortment of the most APPROVED FARMING TOOLS—viz.

Harrison's Corn Shellers; Straw Cutters; double and single mould board Ploughs, of various kinds—Benson's Cultivators—Bennett's Broad Cast Machine for small seed; extra cast steel broad and narrow Hoes—Foster's best English Shovels—Ames' back strapped do. Churn's English cast steel warranted Scythes and Hay Knives; Brush Scythes—Stevens' Patent steel spring Hay and Manure Forks—Brown's Vertical Wool Spinner, &c. &c. Boston, Jan. 25.

NEW SYSTEM OF SHOEING HORSES.

JUST published, and for sale at the principal Book-stores in this city, A NEW SYSTEM OF SHOEING HORSES, by JOSEPH GOODWIN, Veterinary Surgeon to His Majesty George IV. and Member of the Royal College of Surgeons; including Observations on Bleeding and the Pulse, a Concise View of the Anatomy of the Foot, Notes, Remarks, &c. Jan. 25.

AMERICAN MANUFACTURED PAPER.

HOLBROOK & LESSENDEN manufacture at their Paper Mill, in Brattleborough, (Vt.) WRITING PAPER of an excellent quality, and much superior to any of a correspondent price imported. They have Foolscap for \$1.50 a ream, not inferior to English paper which costs \$9.00 a ream. Their LETTER PAPER is also fine, and sold cheaper than imported paper of a similar sort. Specimens may be seen at Mr. Josiah Loring's Bookstore, No. 1, South Row. Jan. 25.

THE MENTOR AND LADIES' BOUQUET.

NATHANIEL DEARBORN respectfully announces to the public, his intention of issuing a Weekly Paper, provided their patronage should authorize the attempt.

This determination has been taken with the advice of many friends, among whom are some ingenious minds which are enlisted for this cause;—it has also been strengthened by the circumstance that the Editor's compositions have been deemed of sufficient merit, generally, to be republished, which has been his only reward.

It will be the intent of the editor, to advance, in every degree within his power, the rational pleasures of man;—to plead the cause of virtue;—to lure the youthful mind to love and to embrace those principles which can never satiate, but which ennoble human nature.

To our fair country women, we pledge our best efforts to promote their interests;—in every act it will be our aim to merit their approbation. The paper will be entitled *The Mentor and Ladies' Bouquet*.

Its general outline will consist of extracts from scientific works;—as a "Mentor," it will always contain some judicious moral essay;—and for the "Ladies' Bouquet," will be gleaned the choicest, fairest flowers.

Its size will be a royal quarto, pagged—issued each Saturday afternoon.—Price, per year, \$2.50; half year, \$1.25; quarter of a year, 75 cents;—payable in advance.

Subscriptions received by Col. Benjamin Loring, No. 50, State-street; Mr. L. W. Goodrich, No. 78, State-st. Mr. Josiah Loring, No. 1, South Row, and at C. Caldwell's Library, School-street.

Should public favor be expressed for the appearance of this proposed work, the same will be announced through the medium of the daily prints. Jan. 25.

From the True American.

TO A NEW-ENGLAND POET

Though skilled in latin and in greek,
And earning fifty cents a week,
Such knowledge, and the income, too,
Should teach you better what to do;

The meanest drudges, kept in pay.

Can pocket fifty cents a day.

Why stay in such a tasteless land,

Where you must on a level stand,

(Excepting people, at their ease,

Who choose the level where they please

See IRVING gone to Britain's coast

To people of another sort,

He will return, with wealth and fame.

While Yankees hardly know your name.

Lo! he has kissed a Monarch's—hand!

Before a PRINCE I see him stand,

And with the glittering nobles mix,

(Forgetting times of seventy-six.)

While you with terror meet the frown

Of Bank Directors of the town,

The home-made nobles of our times,

Who hate the bard, and spurn his rhymes.

Why pause!—like IRVING, haste away,

To England, your addresses pay;

And England will reward you well,

When you some pompous story tell

Of British feats, and British arms,

The marks of honor, and their charms.

Dear Bard, I pray you, take the hint,

In England what you write and print.

Republished here in shop, or stall,

Will perfectly enchant us all:

It will assume a different face,

And post your name at every place,

From splendid domes of first degree

Where ladies meet, to sip their tea;

From marble halls, where lawyers plead,

Or Congress-men talk loud, indeed,

To huts, where evening clubs appear,

And 'squires resort—to guzzle beer.

N.

SELECTED FOR THE NEW ENGLAND FARMER.

The desire of being thought wise is often a hindrance to being so; and a man often remains ignorant of matters of importance to his welfare, merely because he is more anxious to let the world see what knowledge he has than to acquire that which he has need of.

Those men who know most, are the most anxious to know more, because in consequence of being the best able to set a proper estimate on the advantages of knowledge, they value it the most highly. But ignorant people think they have nothing to learn, because they have learnt nothing; and remain contented in ignorance because they are not sensible of their want of knowledge. Some rays from the lamp of knowledge are requisite, in order to make mental darkness visible to those who are enveloped in it.

No man ever did a premeditated injury to another without doing a greater to himself.

Dr. Franklin observed, "The eyes of other people are the eyes that ruin us. If all but myself were blind, I should want neither fine clothes, fine houses, nor fine furniture."

The poorer a man is, the more necessity there is for his being honest. A rich knave may, perhaps, prosper for a while in worldly affairs, but a poor knave will soon have as little credit as cash, and not only suffer but deserve all the evils which poverty can inflict.

The recoil of a blow unjustly aimed, is generally more powerful than its direct impulse.

He who lives without economy or prudence in his youth, may commonly expect to live without comfort in the decline of life.

Many persons are too subtle and suspicious for their own interest and enjoyment. They put some sinister construction on every look, and find out something amiss in every smile. Acting in disguise themselves they mistake all outward shows and appearances for hypocrisy in others. But, perhaps, no people see less of the truth and reality of things than such refineries upon incidents.

Extract of a letter from one of the Editors of the New York Statesman, now in Washington.

Patent Office.—Some days since, a member of the House of Representatives, to whom I am under many obligations for his politeness in pointing out objects worthy of attention, and in imparting information which a long residence at the seat of government has enabled him to collect, accompanied me to the Patent Office. Although our morning visit was protracted at my solicitation, and the superintendents, as well as my friend who had often been there before, were assiduous in pointing out the articles most deserving of particular notice; yet an examination of an hour or two could not of course enable me to take any thing beyond a hasty glance at this great repository of patents and models. It would require a year of close study to investigate and describe the machinery here deposited for the benefit and curiosity of the public. It may be denominated a temple of the useful arts. In a collection of models amounting to three thousand eight hundred in number, there is apparently every possible modification of motion, by a combination in some shape of every principle in mechanical philosophy. All the great agents of nature, such as fire, water, air, steam, animal strength, the gravitation and elasticity of matter, aided by the artificial powers of the inclined plane, lever, screw, wedge, and pulley, have been put in requisition and applied with almost infinite variations, to the purposes of life. I regretted to observe one or two abortive attempts at perpetual motion, as all such attempts must be, until the established laws of nature are changed, and inertness ceases to be a property of matter.

CURIOUS DISCOVERIES.

When the foundations of the city of Quebec, in Canada, were dug up, a petrified savage was found among the last beds to which the workmen proceeded. Although it was impossible to form any judgment of the time which this man had been buried under the ruins, yet his quiver and arrows were in good preservation.

In digging a lead mine in Derbyshire, in 1711, a human skeleton was found among stag's horns. It is impossible to say how many ages this carcase had lain there.

In 1695, the entire skeleton of an elephant was dug up in Thuringia, in Germany; and

some time before the petrified skeleton of a crocodile was found in the mine of that country.

About the beginning of the last century, the curate of Slagarb, in the Swedish province of Schonen, and several of his parishoners, digging turf in a drained marshy soil, found some feet below the surface of the ground, an entire cart with the skeletons of the horses and carter. It is presumed that there had once been a lake or pond on that spot, and the carter had perished in attempting to cross over upon the ice.

By the falling down of a piece of the cliff, on Walton shore, near Harwick, the skeleton of an enormous animal was discovered, measuring nearly 30 feet in length. Some of the bones were nearly as large as a man's body, and six or seven feet long; the cavities which contained the marrow, were large enough to admit the introduction of a man's arm. The bones on being handled broke to pieces. One of the molar teeth was carried to Colchester. It weighs seven pounds, is of a square form, and grinding surface; it is studded with several zigzag rows of laminae, which seem to denote that it belonged to a carnivorous animal. There were more teeth, which were unfortunately broken, one of which weighed 12 pounds. It is probable that the tusks will be found, by searching further into the cliff, or amongst the earth which has fallen down. The above skeleton is supposed to belong to an animal of the same species as that called the Mammoth, the remains of which have been found in North America, Great Tartary, &c.

A laborer in a stone quarry in the village of Pautin, near Paris, having detached a large block of stone, found in the middle, a skeleton of a ram petrified. Each part of the stone contained a perfect half of the animal; the parts were very distinct. The block was dug out of the natural rock at the depth of 30 feet from the summit of the quarry. A petrification so curious, was immediately deposited in the Museum of Natural History.

A Yankee Trick.—An eastern pedlar lately desired accommodation for the night at a tavern in the south part of this county; but from the prejudice frequently existing against this class, our host for a long time refused. At last, he consented, on condition that the pedlar should play him a Yankee trick before he left him. The offer was accepted. On rising in the morning, Jonathan carefully secured the coverlet of the bed, which among other articles he pressed the landlady to purchase. The low price of the coverlet operated at once upon the latter, who insisted that her husband should buy it, adding that it would match her's exactly. Jonathan took his money, mounted his cart, and got fairly under way, when our host called to him that he had forgotten the Yankee trick he was to play him. Oh never mind, says Jonathan, you will find it out soon enough.—*Winchester (Va.) Republican.*

Grammatical Error.—What offence has the unfortunate verb "have," committed, that it should be left out between the pronoun "I," and the participle "done!"—As, for instance, "I done so," "We done so," &c. When inaccuracies like these are found in the walls of a college, and in a legislative hall, it is time to notice, in order to correct them.—*Charleston Courier*

No. 27.

DISEASES OF CATTLE.

SELECTED AND COMPILED FROM THE BEST AUTHORS.
BY THE EDITOR.

Diarrhoea, Looseness, Slimy Flux, or Scouring Rot.

This disorder consists in a frequent discharge of dung, of an unusual color, thin and slimy.—The animal gradually loses flesh, but continues for some time to feed well and ruminate. At length the excrements become of a darker color, and frothy, and in the latter stages have the appearance of half-chewed food, the digestive power being entirely lost. It is said that when animals have been long affected with this disease, they feel a great degree of pain and distress when grasped on each side the backbone, just below the shoulders; and this is sometimes considered, by dealers in cattle, as a mark of a beast's being tainted with the scouring rot.

The fatal symptoms are the dew-lap hanging down and having a flabby appearance; the dung running off, with a putrid and offensive smell, and as it falls to the ground, rising up in bubbles; the hair all over the body appearing pin-feathered, or erect, as if the animal was enduring a severe cold.

The causes of this complaint are exposure to cold and rain, particularly when the animal has been over-driven or heated by working immediately before such exposure. Drinking plentifully of water, under similar circumstances, will also produce this disease. Want of nourishment, particularly in cows that are constantly milked, often causes this disease. Perspiration suppressed by any cause; putrescency of the aliments may also bring on this complaint. It often attacks cattle which have been kept short during the winter, and when they are put to grass in the spring, they are seized with a diarrhoea, particularly if the weather is wet or cold, and grass plentiful.

Mr. Lawrence says, "If, on the first appearance of the scouring, cattle are taken in, and kept on dry food, it will generally supersede the use of medicine." "This," says Mr. White, "is certainly necessary; but is not, I believe, sufficient to eradicate the disease; and though it may suppress it for a time, yet the scouring generally returns, when the animal is again sent into the pasture. The immediate cause of the disorder appears most frequently to be an unhealthy action of the liver, which seems to form bile of an acrid or hurtful quality, by which the bowels are constantly irritated. I would advise, therefore, in the early stages of the complaint, to give the following drink for three successive mornings, which will rather increase the scouring at first; and, when the effect of the medicine has ceased, let the astringent drink be given every morning and evening."

First drink for scouring.

Epsom salts	1 lb.
Nitre	2 oz.
Camphor	$\frac{1}{2}$ oz.
Coriander seed	2 oz.

Mix for one dose.

This dose should be repeated for three mornings following, unless it cause sickness or grip-

ing, or increase the scouring in a considerable degree. On the fourth morning, begin with the astringent drink, or earlier, should the above medicine produce its effect before the three doses have been taken. During the time the cow is taking the former medicine, she should be supplied with warm fluids, of which thin gruel is the best, and must not be exposed to a cold air.

Astringent Drink.

Take of starch	4 oz.
Mix in the usual way, that is, as it is employed for stiffening clothes, with three pints or two quarts of water, so as to make a thick mucilaginous fluid; to this add,	
Tincture of opium	2 dr.
Ginger	3 dr.
Catechu, or terra japonica	$\frac{1}{2}$ oz.
Mix.	

Or the first drink for scouring may be:

Common salt	3 oz.
Flour of mustard	2 oz.
Water	$\frac{1}{2}$ pt.
Oil, or melted lard	$\frac{1}{2}$ lb.

This will increase the discharge for a short time; afterwards, the dung will gradually become of a more natural consistence. But should the scouring continue, give the astringent drink already pre-cribed, or the following:

Powdered catechu	6 dr.
Tincture of opium	$\frac{1}{2}$ oz.
Powdered ginger	2 or 3 dr.
Warm ale, beer or water	$\frac{1}{2}$ pt.
Mix.	

The powder or tincture of galls, would also be found a powerful astringent.

With respect to the scouring, or diarrhoea in calves, which is not an unfrequent complaint, a different treatment is to be pursued. They may generally be cured by the following drink, given morning and evening:

Take of the above starch mixture	1 pt.
Powdered chalk, or what is called prepared chalk	3 dr.
Powdered ginger	1 dr.
Tincture of opium	1 dr.
Mix.	

Lambs are subject to a similar disease, and may be cured by the same means, only lessening the dose.

In the diarrhoea, which arises from exhausting a cow by constant milking, when she is not sufficiently fed, or is supplied with food of a bad quality, the remedy is sufficiently obvious. But, in this case, it too often happens, that the constitution is worn out, before it is thought necessary to alter the poor animal's condition. Whenever this change is made it must not be done too hastily, as other diseases might thereby be produced.

When the scouring has ceased, the cow should be brought back to her usual state gradually. At first she should be turned out for a few hours in some dry pasture, when the weather is favorable; and her drink should be given less

warm. This precaution is highly necessary, as the affected parts do not immediately recover their strength after the scouring has ceased.

The Complete Grazier directs that the beast taken with this disease should be immediately housed and put to dry food, which treatment, in the earlier stages of the disorder, will, generally, effect a cure. Should this, however, fail, it is advised, in that work, to boil a pound of mutton suet in three quarts of milk, till the former is dissolved, and give it to the beast in a luke warm state; or, in obstinate cases, to boil half a pound of powdered chalk in two quarts of water, till it is reduced to three pints; add four ounces of hart-horn shavings and one of cassia, and stir the whole together. When cold add a pint of lime water and two drachms of the tincture of opium; keep the whole in a corked bottle, and, after shaking it before using, give one or two hornsful, two or three times a day, as the nature of the case may require.

Red Water, or Bloody Urine.

In this disorder the urine appears as if it were mixed with blood. As the disease advances, the urine becomes of a darker color, and at length resembles foul coffee; the animal loses strength rapidly, and sinks under the disorder. Cattle attacked by this disease seldom live beyond the tenth or twelfth day, unless it is put a stop to by proper remedies. It is generally attended with costiveness; and if this is not the case at first, it almost always happens in the course of the disorder, unless prevented by laxative medicine. It is caused by weak relaxed vessels; thin blood; cold; change from a poor to a rich pasture; scarcity of water in a long and dry summer; blows across the loins; some animals appear to have the disease hereditary.

Dr. White recommends, in the first place, the following mild laxative:

Epsom salt, [sulphate of magnesia] or common salt	1 to 6 oz.
Nitre	1 oz.
Whey, or thin gruel	1 qt.
Oil, or melted lard (but castor oil is preferable)	6 to 8 oz.
Mix.	

After the laxative, should the disease continue, the following drink may be given:

Alum	1 oz.
Dissolve it in a pint of hot water, and add—Oil of turpentine	2 oz.
Powdered catechu, or terra japonica	1 oz.
Mix.	

When red or bloody water is caused by strains or a bruise in the loins, it is distinguishable by the tenderness of the part, the animal giving way when it is pressed upon, and by stiffness in the motion of the hind parts. In this case, also, a laxative may be given; and, if the injury is considerable, the loins should be fomented with hot vinegar, and afterwards covered with a fresh sheep's skin.

Whenever the animal is observed to be frequently endeavoring to stale, voiding only a

small quantity, with much pain and difficulty. Turpentine and all other diuretics, are improper; mucilaginous drinks, such as infusion of linseed, and decoction of marsh mallows are most likely to afford relief.

The Farmer's Assistant asserts that this disorder has very rarely been known in this country. (TO BE CONTINUED.)

SWEET POTATOES.

We have been requested by several of our friends to furnish directions relative to the most approved mode of cultivating the SWEET POTATOE. The following article is copied from the Boston Daily Advertiser of October 27, 1821; and the signature attached to it, may preclude the necessity of our declaring that the mode of culture which it prescribes may be relied on as correct.

Directions for the preservation of the Slips of the Sweet Potatoes, and for their cultivation.

The Slips are nothing more than the small potatoes or roots last thrown off by the plant.—They are preferred to larger ones on the several grounds, of economy, of food and of room—of their being more easily preserved, and less likely to rot in the ground after they are planted. The writer of this, during fifteen years, never succeeded in getting more than one large sweet potatoe to vegetate or grow in the open ground. The ignorance of the mode of culture has probably been the cause of their not having been raised here.

The slips should be put up for preservation without bruising them (or as the directions from New Jersey expressed it, they should be handled as carefully as eggs) in a dry state, in perfectly dry sand or earth, and kept in a warm place as free as possible from moisture.

Those who wish to be perfectly assured of their success, will raise a small hot bed with, or without glass about the 10th of April, on the south side of a fence, wall or building.—On this, they will lay the slips or roots so close as to touch each other, so that a bed of six feet square will be sufficient for a bushel of them. They should then be covered with about an inch of earth. If the cultivator has no hot bed frames, the bed at night may be covered with a mat or with straw.

In 10 or 11 days some of the shoots will appear above ground; when about one half or even a third so appear, they are all to be taken up to be planted. The lightest soils are best adapted to them. As their roots almost universally strike downwards, like those of the carrot, they are always placed on hills raised about nine inches, or about the height of a potatoe hill, after its last faithful hoeing. These hills should be four feet and a half apart in every direction. The slips, two in each hill, one foot apart, are then put in either with the fingers, or a stick, or any instrument capable of making a sufficient hole, and the crown or top should be within an inch or half inch of the surface. When thus started or sprouted, it will be easy to distinguish the end which sends out roots, from that which puts forth shoots for the open air. The slips should be put in perpendicularly or nearly so, the root end downwards. They would grow without this precaution, but would be delayed and injured in their growth. A little dung dug, or hoed in, will much aid their progress, unless the land be rich. They cannot bear moist, or

any rich grounds, or places, where the water stands, after showers. Their vines grow too luxuriantly in such situations, and their roots are softer and more watery. The late season was too wet to enable us to raise them in the highest perfection, but a majority of them were still very good.

After they are planted they require the same treatment as the squash or pumpkin, that is, simply weeding them. In the Jerseys, they raise the runners from the ground when they weed them, so as to prevent their taking root, which they do more readily than any plant, and which the Jersey farmers think injurious to the main roots. The subscriber permitted nature to take its course, but he should certainly make the trial another year of the New Jersey method.

The products for two successive years have been at the rate of 220 bushels to the acre, with no greater care, nor indeed so much as that bestowed on common potatoes. They were planted this year early in June, and were hilled on the 10th of October, which is at least 45 days less growth, than they would have in common years, or if the seed had arrived earlier. They will begin to be palatable and fit for table about the 15th of September, or the 1st of October, as the season may have been hot or cold; but the general crop ought not to be dug till the vines are killed. They will endure seven or eight successive hoar frosts after the common potatoe stalks have been killed. So many persons have applied for slips, that it was the advice of some of them, that these hints should be published. It is not pretended that the culture is of any agricultural importance—it is merely an horticultural experiment very pleasant to those who have a taste for such pursuits—and also gratifying to those who love the sweet potatoe. They certainly can be raised here of excellent quality full as often as we can raise good grapes, peaches, or even pears.

JOHN LOWELL.

P. S.—They should not be gathered in by the hoe, or even spade—they must be raised like the carrot by the dung-fork.

REPORT

OF THE COMMITTEE ON AGRICULTURE,

Appointed by the Legislature of New York.

We have received, by the kindness of some friend, (to us unknown) a long Report submitted by Mr. BUEL to the House of Assembly of the State of New York.—It is a production of great merit, but its length precludes its insertion, entire, in our columns, at present; though we hope to find room for it hereafter. The following summary sketches of its contents, are taken from the Albany Argus.

On Friday last, Jan. 17, Mr. Buel, from the standing committee on agriculture, made a long and interesting report. This document occupies twenty-two pages of manuscript, and is too long to be published entire in a newspaper. We shall endeavor to present an abstract that will shew the substance and general objects of the report.

In the introduction, the report notices the importance and necessity of having agricultural pursuits aided and protected by the legislature. It mentions the great excess of the value of imports in our country, over that of our own productions exported; and the injurious consequences to be apprehended, unless proper measures

are adopted to prevent them; and insists, that among the measures best calculated to effect a reform, are—the improvement of agriculture—the protection and encouragement of domestic manufactures—a rigid economy in every department of the government.

The report next states, as a subject of regret, that so little has been done for the encouragement of agriculture, while almost every other pursuit in life, has experienced the liberal and fostering care of government.

"If, then, agriculture is the fountain from whose abundant streams every portion of our country is watered and refreshed,—how important is it that we should watch over it with paternal care—that we should disseminate its improvements, and endeavor to multiply its blessings;—that we should elevate it to the rank of a liberal and fashionable study, and call in the aid of science, and of approved experience, to enlarge the sphere of its usefulness. To effect these desirable ends, your committee respectfully recommend, that a law be passed, for establishing a school of agriculture, for the education of our young men in the practice and theory of husbandry."

The report shews, that in no country are the inducements to disseminate knowledge among the agricultural class, so strong as in the United States. And, anticipating the objection, that the project of establishing an agricultural school, might be considered as an untried experiment, states—that though in Great Britain no such school has been established, yet that its place has there been supplied by the liberality and enterprise of several of the great land holders of that country, and refers to several strong cases to illustrate the benefits which that country has derived from the patronage these large land holders have bestowed on the pursuits of husbandry.

The report next shews that the experiment would not be altogether new; that agricultural schools have been established in Switzerland, France, Prussia, Italy, and the Austrian States; and notices, particularly, the very celebrated school at Hofwyl, in Switzerland; which is arranged under the following heads:

"1. A pattern farm, designed to serve as a model. This exhibits 'the principle and the application of all that has been found advantageous, and, at the same time, the most accurate practical details.'"

"2. An experimental farm, designed to advance the progress of the science and the art, to assist the labors of the pattern farm, and to give exercise and instruction to the pupils.

"3. A manufactory of implements of husbandry, of the most approved models, for the use of the school and for sale under the care of a skilful mechanician.

"4. A school of industry for the poor. The boys belonging to this school, taken from the most indigent classes, are gratuitously instructed by a competent master, who is constantly with them. They are kept by themselves—receive a good education, and are taught agriculture, and some mechanic art, in shops attached to the establishment, where most of the useful trades are carried on.

"5. A boarding school for the children of affluence, who are sent thither from the German states as well as from the neighboring cantons. The very complete education which these re-

ceive, under the eye, and in the house of the principal, terminates with a course in the agricultural institute; at the same time its forms pupils who carry to their abodes the theoretical and practical knowledge which they have acquired.

"6. An institute of agriculture, theoretical and practical."

The Hofwyl school was established about 16 years ago, by an enterprising individual of the name of Feltenbergh: It has acquired great celebrity in Europe; has served as a model for others; and has supplied them with instructors. The report gives an account of other schools which have been established under the patronage of the governments of France, Prussia, &c.

It next refers to efforts which are making in some of our sister states to establish agricultural schools: the subject having been twice before the Legislature of Pennsylvania: and in Virginia, the late President Madison is seriously engaged to bring about the establishment of such a school; and it urges on our legislature the propriety of this state's taking the lead in this, as she has in other great public improvements.

The report next points out the several advantages which it is supposed will be derived from such an establishment.

FIRST. To agriculture, by the increase of the productions of the earth; and mentions several instances to prove the almost incalculable benefits which the English farmers have derived from the adoption of what is called the new system of husbandry—by the introduction of improved implements and machinery. "An English writer estimates that 1,800,000 pounds sterling would be annually saved in that kingdom, if half of its wheat were threshed with the improved threshing mills: and Mr. Burgess, of Rhode Island, calculates, that in that small state there must be an annual saving of 3,000 dollars by the general use of Wood's cast iron plough.

That with an experimental farm, great expense might be saved to farmers in general; and many useful improvements would probably be made from time to time.

SECONDLY. To commerce and manufactures. These always flourish with the multiplied productions of the soil.

THIRDLY. To the morals of our citizens.

FOURTHLY. To the revenues of the state. The increased productions of the soil, would necessarily add to the income to be derived from tolls on our extensive canals.

FIFTHLY. To the political institutions of the country.

It proposes to submit the plan and regulations of the school to be determined by a board of commissioners. It appears that Mr. Van Rensselaer, our present representative in Congress, has engaged to give to the institution a sufficient quantity of land, to answer all its purposes.

The report suggests the propriety of appropriating an annual sum for the support of this school, and points out several sources from which funds might be created for the use of the institution. It exhibits a statement of 2,618,579 dollars, which have been appropriated by the state for literary purposes; and concludes by stating, that "The above abstract is not introduced to call in question the wisdom of the legislatures who made these appropriations, but to direct public attention to an important fact

which it discloses, viz. that of all these munificent grants, amounting in the aggregate to about three millions of dollars, not one dollar has gone in *direct* aid of agriculture, the great business of our state, the source of its wealth, and the foundation of its greatness. Of the one million two hundred and fifty-five thousand dollars, given to colleges and academies, the cultivators of the soil have derived but very little *indirect* benefit: for, through these seminaries lies the road to the professions,—not to the plough; to mental, not to bodily labor. Eighty-three thousand one hundred dollars have been appropriated exclusively to the medical department. Now that we have bestowed so much care and expense upon the *limbs*, your committee conceive it to be just and proper, that we should endeavor to infuse intelligence, vigor, and activity into the *body*, that it may the better sustain and strengthen the members."

From the American Farmer.

The Curing or Preservation of Meat; with thoughts on the causes of Rust.

Elmwood, January 10th, 1823.

DEAR SIR,

We had some conversation lately about the yellow rust, that is so disagreeable in bacon;—and I referred you to a paper in your Farmer, vol. 2, on that subject. To the causes there assigned, I have to add another, that I did not know of then; and perhaps it is the most general, viz: the moisture and closeness of the meat house. I was led to this discovery by keeping some meat, that was ready for smoking, three weeks in a close house built on the ground; and before *one* fire was kindled, it was becoming rusty. Salting and drying are the two methods of curing meat—and a proper combination makes our best bacon. The addition of smoke, I consider as merely a flavor, notwithstanding what great chemists have said about rubbing on a little pyroligneous acid to cure meat. The Londoners, I am told, have no smoke houses; they simply dry their meat in kitchens. Meat that is excessively salted by laying very long in plenty of salt, as also such as is excluded from the air, as barrelled pork, is not apt to grow rusty, but by very long keeping. Hence it follows, that our nicest meat is most in danger: and the pieces we salt least are the most apt to be rusty, viz: chins, joles and middlings. Hams are the least liable, because kept longer in salt, and more protected by skin. There can be no doubt that meat kept so long moist, will have some of the salt on the surface carried off by the air, taking up the saline moisture, which is soon collected again;* whereas, when it is dried quickly, the reverse happens, for the decrease in the volume of the meat will condense the salt, and it will crystallize on the surface. I think our small pieces would do best to be first dried in a kitchen, and then smoked four or five days at most. Smoke will flavor and color rapidly when the meat is dry. All meat houses should be constructed so as to be dry and airy. None should be in immediate contact with the ground—but here lies a difficulty, yea, a double difficulty: flies and rogues may enter with the air. I have had a lattice door hung inside my

* Some chemists might deny the salt being carried off in this way, but they have only to look at a brick house near the coast to be convinced; there they will see the salt 100 feet or more, above the water level.

strong door, which latter is shut at dark; and as soon as a fly can show his head, by which time the meat will be cured, I shut all up so close, that one fly cannot see another. This I have found in all places and cases, the only infallible preventive against skippers. Those who continue the light of even four inches square, must put their meat up early in March into bags, or give it a disagreeable dressing with ashes, if they expect to be the only feasters on this gentle delicacy.

Perhaps an opening in the floor of a house, with a grate and wiring, would be more eligible than a lattice door; and if the foundation was well stoned all over, and the house elevated a few inches from the ground, it would be rogue proof; but perhaps even six inches might be too high; for these gentry are very much of the serpent kind, and might flatten out for the moment, to secure a good distention with such tempting stuff.

Such smoke houses as are built over other houses, should have a large flue from the bottom, but the fires should never be put there, or the meat will keep damp—and moreover have a bitter taste—for the warm smoke will be condensed on the bacon by the relative coldness. This I have experienced.

There is much dispute with house keepers whether we should smoke in damp seasons, when the meat is dripping. I consider it safest *not* to smoke; for if you do not succeed in drying it, which can hardly be done so quickly, you will injure the meat much more than the weather will. SILVANUS.

PRINTING PRESSES.

The London Courier of December 6th says; "A newly invented printing press, called the British and Foreign Printing Machine, was exhibited a few days ago to a numerous body of printers and scientific men, who expressed themselves highly satisfied with its extraordinary powers. It appears admirably calculated for the printing of books, news-papers, and, in fact, for every description of work that can be done by machinery. In velocity of movement it rivals steam printing machines, and far excels them in clearness of impression and goodness of register. Two men and three boys were enabled to print at the rate of 25 sheets in a minute, every impression being remarkably clear and perfect. The Patentee, we understand, is Mr. T. Miller of 76 Fleet-street."

The Vertical Printing Press, recently invented by Mr. Daniel Neall, of Pennsylvania, is spoken highly of in the Philadelphia papers.

"One person alone is required to work a Press on this principle. The undivided attention of the operator is required to supply the paper, give the pressure, and remove the printed sheet; while the machine, by acting and reacting powers, supplies the type with ink, maintains its motion, and prepares for a new impression, in less time than would be requisite for two hands in the common mode, to perform half that service."

The whole number of the Militia of the United States and Territories, agreeably to the latest returns that have been made, amount to 937,417, allowing five thousand for the Arkansas.

LEGHORN STRAW.

TO THE EDITOR OF THE NEW ENGLAND FARMER.

SIR—I send you for publication in your paper, (if it shall be found worthy a place,) some account of the wheat, from which the Leghorn hats are made. In the summer of 1821, I wrote to Mr. Appleton, our Consul at Leghorn, requesting him to give me some account of the straw, from which these bonnets are made; owing to an accident, my letter did not go by the vessel which I intended, and I did not expect it to go by any other—but the letter found its way to Italy, and this gentleman, in the most obliging and attentive manner, caused four bushels of Tuscany wheat, with an account of the mode of cultivation and preparation to be forwarded to me; it came by the way of Providence, and so late in the spring, that I was not able to have it distributed and cultivated, with that care and attention which I was desirous it might be. Mr. Appleton's account of the cultivation of Leghorn straw, and the preparation of it for manufacture, is contained in the following extracts from his letter to me.

“LEGHORN, 15th Sept. 1821.

“SIR—The letter you honored me with, was handed me in the course of last month. I immediately wrote to a friend at Castel Fiorentino to obtain the best seed for straw, but it was too early, which will apologise for not availing myself of the vessel you mentioned. I have now procured four bushels, and forward it to you by the brig Mary, of Providence, Capt. Dagget. You have my ardent wishes for the success of the trial of this grain; but should you find you are still deficient of any information I can furnish, have the goodness to inform me, and be assured it will exceedingly increase my gratification if I should be able to remove every obstacle to the attainment of your views.

The grain which produces the straw worked into hats at Tuscany, is here called “Marzola,” or March Grain. It is sown in March and arrives at its appropriate maturity, for the manufacturing of hats, from the twentieth to the thirtieth of June. It is sown in somewhat dry and elevated grounds, which should be broken three, four, or more days successively, to prepare it for planting the seed, when four times as much seed, as is usually planted of wheat intended for bread, should be planted on the same space of ground; for the thicker it is planted, the finer will be the straw. It is here gathered when the plant is in blossom, which as I have before said, is in Tuscany towards the end of June.—When it has risen to this state of maturity, it is about eighteen inches high; it is then pulled up by the roots and left two or three days on dry ground to air, after which each straw is taken up separately and stripped of a thin pelticle which covers it, beginning at the top and so down to the first joint, above the surface of the ground; the first joint and root are broken off, and are of no value. After this operation is performed on each straw, they are tied into small bundles of about four inches diameter; and immediately after, in order to bleach them, the bundles which are slightly bound with a straw, are opened at both ends in the form of a fan, laid on a field of grass to take the nightly dew, and thus left for two months, carefully observing to put them under cover whenever there is an appearance of rain, as the latter is prejudi-

cial. When bleached, they are opened and separated into three qualities, which form the superfine, fine, and ordinary. The first is not only formed from the finest straws, but should be of the same size and color, and without spots or stains; from these last are fabricated hats even to No. 100, which signifies 100 circles on the brim, which are easily counted. The straw when prepared is carefully preserved in dry chambers, when it is good for two or even for three years use. The working the straw into hats commences in September. The grounds in Tuscany, in which is produced this straw, are from ten to twenty miles from Florence, and lie in lat. 43.46. The thermometer of Fahrenheit rarely rises above 83, and there are not ten days in winter when it descends to freezing point, or 32. I have not observed in twenty-three years of my residence here, more than three or four times the thermometer at five degrees below congelation; and this extreme at most for a single day. From November to the end of February, the thermometer, with the exception I have mentioned, marks from 40 to 60. In the last six years I have not seen any snow on the level country, except about one inch for two or three days the last winter, while there is no example of the freezing of grounds. Having been absent from my native country for five and thirty years, I shall not hazard an opinion if the climate of Massachusetts is congenial to the growth of this plant; but as I am informed it succeeds in the plains of Lombardy and near to the Alps, I do not despair of a proportionate success in your state. In the villages where the straw hats are fabricated, it is the employment of all the inhabitants, from the oldest men and women down to children of three or four years. It is likewise their amusement, for they carry a little bunch into their afternoon or evening assemblage, and it is worked with as much apparent inattention as our women knit in America. On one side of the waist is fastened the little bunch of straw, and on the other the strands they have braided. They have brought this interesting and pleasing employment to such perfection, that I have seen hats which were bought at two hundred dollars each.”

It was not until the middle of April, that this wheat came to Boston. I caused it to be distributed; one bushel to Leman Stone, Esq. of Derby, the President of the Agricultural Society for the county of N. Haven; from this parcel I have not received any account, but hope soon to have a full report from that quarter; other parcels went to the states of Maine, N. Hampshire, Vermont, and in one instance to N. York; other small parcels were disposed of in my own immediate neighborhood. I have received but few accounts of the culture of this plant, but from my own observations upon what I saw growing, I am fully in the belief that this grain can be cultivated in New England, and the manufacture of hats eventually carried to as great perfection, as it has attained in Tuscany.

The finest and best straw which I have seen, was cultivated by Doctor M. Spaulding of Amherst, N. H. (an ingenious and scientific agriculturist;) an account of his mode is contained in the following extract from his letter to me on the subject, to wit:—“I sowed the wheat on the 20th of April, 1822, just as I received it, without any preparation, except mixing with it a little air slacked lime. The quantity of seed

put upon the ground, was agreeable to the instructions which you had published in the newspapers. The land was a light, dry, sandy loam soil, rather elevated, and not entirely free from stones. It had been planted with potatoes the year before. The wheat or straw [from forgetfulness] stood a few days longer in the field, before gathering, than the newspaper instructions would seem to allow; no peculiar attention was paid to the preparation of the ground, more than is common for the sowing of oats, or any other spring grain. I am of opinion that you sowed yours upon too rich a soil, that my success was not owing to superior skill, but inferior soil.” The next best sample which I saw was cultivated by John Hubbard, a farmer in Groton. His account is, that towards the last of April, he sowed one pint of the wheat which came from Tuscany, upon a piece of ground that had been planted the preceding year; that in the centre of the field, which he sowed with oats, he staked out a small square, taking care not to carry any of the oats into it, and sowed his wheat about four times as thick as is sown to raise spring wheat; being thus shaded on the sides by the oats, it grew very even, was but very little rusted, that he reaped some part of it, and had about two quarts of grain, which he thinks equal in quality to the seed he sowed; that he saved a parcel of the straw, which an aged mother prepared agreeable to Mr. Appleton's directions, and from which she made a hat, of a quality about equal to No. 10, [or 10 rims to a good sized brim,] the straw appeared as tough and firm as the imported hats.

In most cases, where I saw the wheat growing, it appeared to have been planted in rows, on a rich soil, and instead of attaining the height of 18 inches, as it does in Tuscany, actually grew upwards of 4 feet, and was too coarse for use, though it retained a supple texture, and it appeared to me might well have been wrought into carpets. I should recommend to those who intend to cultivate this wheat, to have one field for the purpose of raising seed, where the preparation of the ground should be like that which good cultivators of spring wheat use, and I am clearly of opinion, that the earlier it is sown in the spring the better will be the chance of a crop.

Those who cultivate for the straw had better sow broad cast, and eight times as thick as is usually sown for bread-stuff; the ground should be a light loam, without any manure. It is well known to all farmers, that the thicker any grain, or grass, flax or other plants, are sown, the finer will be the straw; and a gravelly knoll, such as we sometimes observe in a rye field, where there is a slender straw, almost without heads, appears to be well adapted to produce fine straw, and where the field or patch of ground can be surrounded with other grain (so as not to have any outside rows,) the straw will be brighter, and less liable to rust.

How far the process used by the straw-braiders in Massachusetts, of bleaching with brimstone, can be successfully applied to the Leghorn straw, in preference to the slow process used in Tuscany, of bleaching by the dew, time and experience can determine.

The manufacture of straw in the vicinity where I reside, is annually becoming a more important branch of industry, which is wholly

pared in families, every part of the manufacture being domestic. It is a well known fact, in many towns and villages, the proceeds of the manufacture of straw exceeds the value of the surplus beef, pork, butter, grain and so forth that is sent to market. Hence the advantages which will result from the introduction of a more firm and durable straw than rye, in which the labor of so many persons can so well be bestowed, are continually becoming more obvious.

I am, sir, your obedient servant.

SAMUEL DANA.

Wroton, Jan. 1823.

REMARKS BY THE EDITOR.

We fully concur with the Hon. writer of the preceding article, with regard to the probable public benefit derived from the cultivation of the kind of wheat we described, and the introduction of the manufacture of Leghorn bonnets, &c. We would, however, suggest the propriety of the application of a small quantity of lime, finely pulverized, to the soil on which proposed to raise this, as well as any other kind of wheat, unless it is sown on lime stone land. In Tuscany, we are told, that the soil on which this wheat is raised, is selected among calcareous [lime stone] hills. Here, it is said by chemists, constitutes a part of the soil, as well as of the berry of wheat. If lime is native in the soil, nor supplied by art, we do not know how the wheat-plant, which is constituted in part of lime, can possibly be matured. The lime may be either caustic or quick lime, pounded lime stone, or lime mortar, or plaster reduced to fine powder. As vigorous or large growth of wheat straw, however, is not wished for, a small quantity of lime would properly answer. It is hardly necessary to observe that quick lime is used it should not be applied while plants are growing. See N. E. Farmer, No. 12, p. 92; No. 18, p. 139; No. 24, p. 192.

FACTS AND OBSERVATIONS RELATING TO RICULTURE & DOMESTIC ECONOMY.

FOR THE NEW ENGLAND FARMER.

On Neat Cattle.

(Continued from p. 204.)

Among the most remarkable breeds of animals of the Bos, or Neat Cattle genus, are the wild Cattle of Great Britain. This breed is at present to be met with in some gentlemen's parks, where they are said to remain in their original wild state. The following account of them is given by Mr. Bailey, an English writer. "Their color is invariably of a creamy white; muzzle, black; the whole of the inside of the ear, and about one third of the outside, from the tip, downward, red; horns white, with black tips, very fine, and bent upward; some of the bulls have a thin, upright mane, about an inch and a half, or two inches long. The weight of the oxen is from 35 to 45 stone, and the cows from 25 to 35 stone, the four quarters, 14 lb. to 16 stone. The beef is finely marbled, and of an excellent flavor.

"From the nature of their pasture, and the frequent agitation they are put to by the curiosity of strangers, it is scarce to be expected they should get very fat; yet the six year old oxen are generally, very good beef, from whence it may be fairly supposed, that in proper situations they would feed well.

"At the first appearance of any person, they set off in full gallop, and, at about the distance

of two hundred yards, make a whirl round and come boldly up again, tossing their heads in a menacing manner; on a sudden, they make a full stop at the distance of forty or fifty yards, looking wildly at the object of their surprise; but upon the least motion being made, they all again turn round, and fly off with equal speed, but not to the same distance, forming a shorter circle, and again returning with a bolder and more threatening aspect than before; they approach much nearer, probably within thirty yards, when they again make another stand, and again fly off; this they do several times, shortening their distance, and advancing nearer and nearer, till they come within such a short distance, that people think it most prudent to leave them, not choosing to provoke them further.

"The mode of killing them, was, perhaps, the only modern remains of the grandeur of ancient hunting. On notice being given that a wild bull would be killed on a certain day, the inhabitants of the neighborhood came mounted, and armed with guns, &c.; sometimes to the amount of an hundred horse, and four or five hundred foot, who stood upon walls, or got into trees, while the horsemen rode off the bull from the rest of the herd, till he stood at bay, when a marksman dismounted and shot him. At some of these huntings, twenty or thirty shots have been fired, before he was subdued. On such occasions, the bleeding victim grew desperately furious from the smarting of his wounds, and the shouts of savage joy that were echoed on every side. But from the number of accidents that happened, this dangerous mode has been but little practiced of late years, the park keeper alone generally shooting them with a rifle gun at one shot.

"When the cows calve, they hide their calves for a week or ten days, in some sequestered situation, and go and suckle them two or three times a day. If any person comes near their calves, they clap their heads close to the ground, and lie like a hare in form, to hide themselves; this is a proof of their native wildness, and is corroborated by the following circumstance, which happened to the writer of this narrative, who found a hidden calf, two days old, very lean, and very weak: on stroking its head, it got up, pawed two or three times like an old bull, bellowed very loud, stepped back a few steps, and bolted at his legs with all its force: it then began to paw again, bellowed, stepped back, and bolted as before; but knowing its intention, and stepping aside, it missed him, fell, and was so very weak, that it could not rise, though it made several efforts; but it had done enough, the whole herd were alarmed, and coming to its rescue, obliged him to retire; for the dams will allow no person to touch their calves without attacking them with impetuous ferocity."

The foregoing are some of the most remarkable breeds of neat cattle, where the varieties are most strongly marked. To enumerate all the kinds which are treated of by British and other foreign writers, would require a large volume. We shall, therefore, omit for the present, any farther notice of any particular breed of neat cattle, and proceed to such facts and observations as apply to all the varieties of this most useful quadruped, which the art of man has ever brought within the sphere of his dominion.

"In point of utility and profit, no animal can stand in competition with the cow; a sentiment which has been universal from the primitive ages, and which, to this moment, has lost nothing of its force or truth. Her milk, so indispensable to civilized man, is her most precious product, and of which the value, in various forms, is so universally and feelingly understood. Of this real liquor of life, more valuable than the richest wines, the cow will give the amount of many times her weight in the course of a year, and every year, that she continues in a constant state of reproduction, unto the end of life, when her last gift to man is food of the most substantial kind, and so many articles of various uses, that no part of her carcass need be wasted or lost; the worth of these replaces, probably doubles her original cost."

For some of the marks of a good cow, the reader is referred to No. 3, page 21, of the New England Farmer. To the signs there specified, may be added the following. "The indications of copious milking, in whatever species of cows, are a capacious and thin udder, large teats, with a large and distinct milk-vein; these are generally accompanied with a fineness of the head and chops; thinness of the neck, and somewhat gaunt and meagre appearance of body, promising no great tendency to fatten. In common when a large and fine udder is found, sufficient milking need not be doubted."

The cow goes nine months with young, and rarely produces but one calf at a time.—Where the herd is extensive, an account should always be kept of the time when each cow goes to the male, that she may be dried off at a reasonable distance of time before the gestation be completed. The most proper time for the cow to be dried off, according to a writer in Rees' Cyclopaedia, is about two months before her calving, when she ought to be suffered to lie quiet, and not be brought up with the other cows at the milking or suckling times; for if a cow be continued in milk nearer to the time of calving than two months, it will not only greatly injure her future progeny, by rendering it weakly and stunted, but will have an ill effect on the health of the cow herself. It is, however, said by others, that when cows are well fed, they may be continued in milk till within a week or two of their calving, without suffering any injury from it. But, in general way, it is thought best to let them go dry for a month, or six weeks, or more, according to their condition, in order to the more fully recruiting their strength. But where only one or two cows are kept for the use of a family, it may be well to know that, by good feeding, they may be continued in milk till within ten days or a fortnight of the time of their calving, without much inconvenience or injury to the animal.

During the winter season, the cows which are expected shortly to calve, ought to be lodged every night under some convenient shelter, for a week or two previous to calving; as it may be the means of saving the life of the calf and perhaps of the dam likewise. If the cow catches cold by calving abroad, which may be perceived by her trembling joints, and her refusal of food, she ought immediately to be housed under a warm shed, or other building, together

* Lawrence on Neat Cattle.

† Generally about from 270 to 300 days. See New England Farmer No. 18, p. 132.

er with her calf, and treated as heretofore directed in cases of cold.* She should be allowed the best and sweetest hay, and not suffered to drink any cold water.

The milch cow is generally in her prime at five years old, and will commonly continue in a good milking state till ten years of age, or upwards; but this depends greatly on the constitution of the animal; some cows, like other animals, exhibiting marks of old age, much earlier than others. They can, however, seldom be kept with advantage to such an age.

(TO BE CONTINUED.)

FOR THE NEW ENGLAND FARMER.

A QUESTION IN PRACTICAL SURVEYING.

There was a wealthy farmer had an extensive pasture for his calves, geese, &c. It was bounded by seven very irregular sides and angles—on one of the lines there was a pond or spring head—in his will he left it to his two sons to be equally divided in two parts, by one straight line drawn through the spring for both parts to have water. I demand the rule by which it may be most readily done, either by calculation or *Semi Geometry*, and if the answer is not made in three months after this is published, life and health permitting, I will endeavor to shew how it may be done by calculations, or far more readily by *Semi Geometry*, if I could have correct plates engraved.

SAMUEL PRESTON.

Stockport, Pa. Jan. 13, 1823.

THE FARMER.

BOSTON:—SATURDAY, FEB. 1, 1823.

The attention of our readers is requested to an interesting article (page 212 of our present No.) on the subject of *TUSCANY WHEAT*, imported by the Hon. Mr. Dana. Samples of the straw, the braid, and the wheat, may be seen at the office of the New England Farmer. Seed wheat of this kind may be obtained in small parcels, at the store of Mr. Joseph Bridge, No. 25, Court-street.

ON SAVING AND MAKING THE MOST OF MANURE.

(Continued from page 191.)

In our last number on this subject, we showed that actual experiment would appear to warrant a conclusion that the *urine* of neat cattle, if properly collected, preserved, and applied, would furnish more manure or food for plants, in the proportion of 7 to 6, than the solid evacuations of the same cattle. And that “in five months, each cow discharges urine, which, when absorbed by loam, furnishes manure of the richest quality, and most durable effect, for half an acre of ground.” If this be true in its full extent, it is certainly a great discovery; and perhaps of as much importance to farmers, as the introduction of Plaster of Paris, clover, or any other of the artificial grasses. We style it a *discovery*, because if cultivators in general, had ever been apprised of the value of this substance, it cannot well be credited that they would let it be wasted, or worse than wasted; serving to corrupt the air instead of feeding the crops of the farmer, and giving him poison, when, with a little attention, it might furnish him with food. And here, before we advance

any further on the regular highway of our discourse, we beg to be indulged in the liberty of stepping aside, in a short digression, (or what the poets call episode) on the value of manure in general.

When we reflect that the old adage “*manure is the mother of corn*” is not only true, but that we may carry the sentiment still farther, and say that manure is the parent of all profitable vegetation, we cannot but be deeply impressed with the importance of embracing every practicable and economical method of saving and making the most of so precious a product. By proper attention to the accumulation and application of manure, our lands instead of *wearing out*, would *improve* under the hand of the cultivator, and produce crops greater in quantity, and superior in quality to those which grew upon them when first reclaimed by the axe and the harrow from a state of nature. Our hardy yeomen instead of leaving the land of their fathers to waste their lives in the wildernesses of the West, might remain at home contented and happy, in possession of all the privileges and comforts of cultivated society, together with as much affluence as is necessary for the pursuit and enjoyment of happiness. By increasing our manure, we increase our crops, and by increasing our crops, we accumulate manure. The cause not only produces the effect, but the effect gives additional efficiency to the cause.—The farmer who neglects to preserve and make a judicious use of his manure, will not only starve his next succeeding crops, but weakens or destroys the first link in his whole chain of crops. His first step is down hill, and having begun to back slide, every day renders his progress, in the way of good and profitable farming, more and more difficult.

But to return and resume the thread of our Essays. Notwithstanding the experiments of Mr. Alexander, detailed in our former observations, would seem to lead to a belief that the urine of neat stock is of *more* value than their dung and litter, there are some things to be thought of, which would make this at least a disputable, if not a doubtful conclusion. Sir John Sinclair, although he allows this substance to be useful, does not rate it so high as would seem to be its value, according to the result of Mr. Alexander's experiments, and the remarks thereon, which we have quoted from the “*Letters of Agricola*.” In the code of Agriculture (page 202,) it is stated that “every sort of urine contains the essential elements of vegetables in a state of solution. The urine of a horse, being so much lighter, would be more valuable than its dung, if both were conveyed to any distance. The urine of six cows or horses will enrich a quantity of earth sufficient to top-dress one English acre of grass land; and as it would require four pounds worth of dung to perform the same operation, the urine of a cow or horse is worth about 12s. per annum, allowing 8s. per acre as the expense of preparing the compost.” Perhaps, moreover, the whole of the urine may not be lost, if it is not separated from the solid manure. If the cattle are well littered, a part of the liquids will be absorbed by the straw or other litter, and a part, mixing with the excrementitious matter, may increase the strength and efficacy of the latter. This may be a useful result when the dung is intended for one of the ingredients of compost, and is to be *diluted* (if

we may use the expression in this case) in earth. The excrements of cattle, however, kept under cover, (as they should be till applied to the soil,) are a manure sufficiently powerful. To add urine to dung, which has neither been dried by the sun and air, nor wasted by any other means, would not, in our opinion, be the most economical method of disposing of the former substance. Fresh urine, when undiluted, will sometimes destroy vegetables, and when it is added to the dung, and applied to plants, it affords them no nutriment in too concentrated a state. Feeding plants with a substance of this kind, would be like attempting to nourish animals with pure oil or sugar, and to stimulate them with unmedicated alcohol. For these reasons, as well as for the sake of preventing putrescent fermentation, we are fully of opinion that the liquid ought to be kept separate from the solid parts of cattle manure.

With regard to the mode in which the separation of each of these substances can be most economically effected, and both the solid and liquid parts preserved and applied in the most effectual manner, it would be difficult to lay down general rules, applicable to all cases. We will, however, suggest a few hints for the consideration of practical farmers.

1st. Loam, peat, or other earth may be deposited under horse and cow stables, and the liquid part of the manure allowed to filter through cracks or small holes bored in the floor; which for such purpose should be composed of planks easily taken up. This method has been adopted by Mr. Williston, of Brookfield, Mass. as stated in the *Agricultural Repository*, vol. iv. p. 193. In this way, however, we should apprehend the liquid matter would not spread evenly, nor impregnate the earth below equally.

2d. There may be a gutter or offset fixed behind the cattle, consisting of boards or planks, with cracks, or crevices between them, to permit the liquid matter to descend. Below this may be a pit or trench, which may, as occasion requires, be filled with earth to receive whatever flows from the stable. But here the same objection would apply, which is stated in the last mentioned method. In either case, the top of the earth or loam might become encrusted in such a manner, that the liquid would stagnate on the surface, and form a noisome and fetid pool, instead of incorporating with the earth. Both these methods, however, have been adopted, as we learn, with some degree of success.

3d. Barrels, hogsheads or other proper vessels may be sunk at each corner of the stable or cow house, and channels or gutters lead to them, so that they may receive the drainings from the cattle. These may be emptied as occasion requires, and incorporated with loam or other proper substance, which should be under cover so as to make a rich compost. Or, in the proper season, the contents of these cisterns may be used to water vegetables either by means of a gardener's watering pot, or by a hogshead attached to a box, full of holes, the whole drawn by oxen, and the liquor sprinkled over the ground as they advance, according to the method pursued by Mr. Smith, as stated in his address published in the *New England Farmer*, No. 1, page 44. Both these last mentioned modes may be adopted; the liquid applied to manure, grass or other vegetables in the proper season, and when not wanted for that purpose, may be ble-

and incorporated with loam. The loam may be kept under cover for that purpose, and with aid of a hoe, or garden rake, may be easily equally impregnated with the salts, &c. ch were held in solution by the liquid ap-
(TO BE CONTINUED.)

FARMER SUMMARY OF NEWS.

CONGRESS.—There appears to be but little business completed by that body which is of general interest. Bills are read and committed, and bills to pre-debtors being committed seem to be the order of day. Various details of matters and things relating to A. B. & C. which to give in detail would "a tired pen require," are presented, debated, and some probably be decided upon, either during the present or future session. By a communication from the Secretary of the Treasury, it appears that the imports for the year amounted to \$83,241,541, and the exports \$2,160,231. The bill for the disbursement of public money is still before the Senate. Mr. Plumer of N. H. has reported a bill for allowing costs to patentees, executors, &c. where the sum recovered shall not be less than fifty dollars. A committee have reported it is not expedient to legislate on the subject of vaccination. Messrs. Gales and Seaton, proprietors of the National Intelligencer, complained to the House that honesty as printers had been impeached by an article in the Washington Republican. This relates to a thing, thought to implicate Mr. Crawford, relative to the Bank to the westward, but of which it seems us to be mute, as the affair is before a committee of the House. Whenever it assumes a tangible, matter of shape, we shall put our hand upon it.

MASSACHUSETTS LEGISLATURE.—This honorable body appears to be chiefly occupied in concerns of a local and private nature. A number of companies have been incorporated of a religious and secular nature. Among the latter is the "Boston Gas Light Company," who will probably shed light in our path. To accomplish this and we do not then walk in the way of rectitude it will not be their fault. A petition has been exhibited for converting Amherst Academy into a College, but the petitioners have had leave to withdraw their petition. A bill has passed the House, which provides for the payment of one per centum on the amount of all goods, wares and merchandise, and half per centum on the amount of all real estate at auction in this state. The bill respecting public worship and religious freedom has passed the House as 67, nays 41.

FOREIGN.—Letters from Smyrna, as late as the 10th of Nov. confirm the account of the return of the Turkish fleet to Tenedos, but state nothing of any serious engagement with the Greek fleet. The defeat of the Turkish army, which had invaded the Morea, is confirmed; but the remains of it, at the last date, posted in the citadel of Corinth, and besieged by the Greeks. The late arrival from Europe at New York has brought intelligence from London to the 9th Dec. By this it appears that the British and Portuguese are determined to remain neutral in the dispute between France and Spain; and that the Cortes are determined to reject any proposition for modifying their constitution. The war still continued between Persia and Turkey, it was reported that the Persians were within a few hours march of Bagdad. There was no prospect of war between Russia and Turkey.

The Mexican public affairs wear a revolutionary aspect, the reign of Huertado seems near a period. General Anna has raised the standard of revolution, and published a proclamation replete with promises of patriotism. On the 6th of Dec. three days previous to his proclamation, the general sent a letter to his military master, advising him to abdicate, and intimating that he could enforce his reasons with two thousand troops. The Fort of San Ullao has surrendered to the troops of Huertado. Affairs in Havana appear to be settling into a quiet and commercial state.

The late New Orleans paper says, "a rumor has been circulating here, that the British are about embarking seven black regiments from their ships in the West Indies, in order to take possession of

such parts of the Island of Cuba as have become notorious for piracy."

A school has been established at Edinburgh, for imparting to mechanics the philosophical principles of their respective occupations; and a similar school at Glasgow, under Mr. Ure, who lectures on the various branches of science connected with the arts.

The Boy of Algiers has issued a decree, that every bachelor of more than 20 years of age, shall be flogged in public every day till he takes a wife.

DOMESTIC.—On the night of the 12th ult. the house of Mr. Nathan Ross, Jr. of Anson, Maine, was consumed by fire, and Mrs. Ross, with three children, were burnt to death.—On the 9th ult. a young woman of Chelton, S. C. died in consequence of injury sustained by her clothes taking fire; her sister was materially injured in attempting her rescue.—The dwelling house of Mr. Calvin Briggs, of Putney, Vt. was consumed by fire on the night of the 23d ult. together with the household furniture, nearly all Mr. B.'s papers, some money, about \$400 worth of leather, and all the provisions and clothing for his family.—A factory in Vernon, Conn. owned by a Mr. Abbot, was destroyed by fire, on the 24th ult.—Several stores, containing valuable merchandize, among which was 400 bales of cotton, crates of crockery, &c. were consumed at Philadelphia last week; supposed to be the work of an incendiary.

The maniac Trask, who lately broke jail in Boston, has been taken in the barn of the Hon. Christopher Gore, in Waltham, without resistance, and returned to the jail from whence he escaped. He had on the iron collar and fetters, with which he was encumbered previous to his escape.

The House of Assembly of New-York has passed an act to abolish imprisonment for Debt.

State Prison.—According to a report for the year ending on the 30th September last, the average number of convicts in the prison was about 275. The number received during the year, was 91—the number discharged was 83, of whom 14 only were pardoned—10 died, and one escaped. The amount received from the sales of stone was \$23,796; the amount for labor of shoemakers, weavers, brush-makers, &c. \$9,544. The balance against the prison, on the accounts of the year, was \$8,371, besides the salaries of the directors, physicians, chaplain, and warden, amounting to \$2,900.

Mechanical Invention.—A Clover Mill has been erected at Poughkeepsie, N. Y. under the direction of Mr. Boulton, which is highly spoken of, as calculated to separate all the seed from the chaff, and, at the same time, leave the former remarkably clean and handsome. The machinery is described as very simple, the cost trifling; and, if generally used by the farmers of Dutchess county, it is calculated that, instead of purchasing their clover seed, grown in other parts of the Union, they will be able in a few years to raise a sufficient supply for themselves.—*N. Y. Mechanics' Gaz.*

TO CORRESPONDENTS.

We have received at too late a period for insertion in the present paper a very valuable communication from a gentleman in Worcester, which we shall publish in our next. The delay in our reception of the manuscript, we understand, was caused by its contents having been communicated to a number of gentlemen, belonging to the Legislature, for purposes connected with the interests of agriculture.

The paper from a gentleman from Newton, on the subject of pruning fruit trees, &c. is received, and shall soon be published.

LAW OF PATENTS FOR NEW INVENTIONS.

CHARLES EWER, No. 51, Cornhill, Boston, has just published, "An Essay on the Law of Patents for New Inventions." By Thomas G. Fessenden, Counsellor at Law. The second edition, with large additions, corrected and improved by the author.

This work is adapted as well to the use of the Artist and Mechanic as of the Lawyer. The whole was carefully reviewed in manuscript, and recommended by gentlemen of the first legal talents in New England.—The Hon. Judge Story, in a letter to the author, observed, "I have no hesitation in expressing my opinion that the book will be highly useful to all persons, who are engaged in obtaining patents, or in vindicating them in Courts of Justice. The manuscript contains a

collection of all the cases, on the subject of Patents, within my knowledge; and the principles contained in them are detailed with accuracy and fulness in the Summary at the conclusion. I know of no work so comprehensive as yours on the subject; and it may be relied on as a safe guide."

The Hon. *William Prescott*, and the Hon. *Daniel Webster*, after perusing the manuscript stated their opinion as follows: "This edition is a great improvement on the first, and we think it will be a valuable and useful book to the profession, as it contains the statutes, and states, we believe accurately, all, or nearly all the decisions, which have been made on a branch of law, daily growing more interesting and important."

George Sullivan, Esq. a gentleman who has paid much attention to this branch of law, has likewise favored the work with a recommendation, from which the following is an extract:

"Your method of arranging all the decisions in the order of an analytical digest of the several requirements and provisions of our statutes for granting patents, puts the lawyer at once in possession of the judicial construction of the statutes; while your synthetic Summary, far more extended and comprehensive than in the former edition, places within reach of the mechanic a sure means of judging whether his invention is a fit subject for a patent; what is required of him by the statute in order to obtain his patent; and what provisions are enacted for securing to himself and heirs, his meritorious privilege." Feb. 1.

CEREMONY; Or, more Compliments than Courtesy.

"Sir, will you please to walk before?"
 "No, pray Sir, you are next the door."
 "Upon mine honor, I'll not stir—"
 "Sir, I'm at home, consider Sir,—"
 "Excuse me, Sir, I'll not go first."
 "Well, if I must, why then I must—"
 "But yet I wish I could evade it—"
 "'Tis strangely clownish, be persuaded;
 Go forward cits! go forward, squires,
 Nor scruple each, what each admires.
 Life squares not, friends, with your proceeding;
 It flies, while you display your breeding;
 Such breeding as one's granam preaches,
 Or some old dancing-master teaches.
 O, for some rude, tumultuous fellow
 Half crazy, or at least half mellow,
 To come behind you unawares
 And fairly push you both down stairs!
 But death's at hand, let me advise ye
 Go forward, friends, or he'll surprise ye."

From the New York Statesman.

NORTHERN COTTON.

A valued friend and correspondent, about 12 months since, wrote several essays which were inserted in the Statesman under the signature of "Agricola," on the cultivation of cotton in this vicinity, and urging upon our agriculturists to make the attempt. The idea that this plant, a native of a warm and sunny climate, would vegetate in our bleak northern latitude, or at most do more than spring from the ground and perish before a branch would put forth, was perfectly novel, and considered by many, notwithstanding the ingenious arguments of "Agricola," as entirely chimerical. Our correspondent was so confident in his belief, that he procured at his own expense, a number of barrels of seed from the south, which were deposited with us for gratuitous distribution. The result of several experiments has already been stated, and specimens of cotton of the growth of the past year, rendered it certain that this plant could be advantageously cultivated in this climate, were we assured that the frost would appear no earlier than it did the last season. But we have now the satisfaction of communicating to the public the result of an experiment, affording abundant evidence of the important fact, that cotton can be raised with us, not only without fear of injury from the frost, but that it is one of the most certain crops which can be produced.

We have seen this morning, at the Auction Room of David Dunham, Esq. the crop of cotton which grew in his garden at his seat on Long Island, and which was picked on the 5th, 14th, and 25th of December and 11th of the present month. It is all of an excellent quality, in every respect equal to any of the numerous specimens we have seen which were picked before the frost had touched the plant. We have little doubt, the discovery that frost does not prevent this plant, after it has arrived at a certain stage, from yielding the desired crop, will be productive of important result to this section of the country, and we take pleasure in presenting the following interesting memorandum obtained from Mr. Dunham.

"The cotton here exhibited was raised in my garden on Long-Island from about 250 to 300 plants: the seeds procured from the editors of

the Statesman last spring, and by them obtained from a gentleman friendly to agriculture. The seeds were put in the ground on the border of the garden the early part of May, but by inattention, the sea island and upland were planted promiscuously; six, eight and ten seeds were occasionally put into a hill, when on their coming up, the stalks were found to be too thick, and the surplus plants were transplanted into an open field with some corn; immediately after which we had a terrible drought, and the plants were so much stunned that they came to little or nothing. In the border of the garden there were many flowers planted, which must rather have impeded the growth of the cotton, for some of the plants were almost hidden by shade. In August the plants began to flower, and they grew very luxuriantly till the first frost, which completely checked all further vegetation. At this time there had been but one picking, on the 20th Oct. The gardener was about to pull up and throw away the residue of the plants, as being of no value, but was prevented, and on the 1st of Nov. as fine a picking was made as the one previous. The 20th of the same month another picking, on the 5th, 14th and 25th days of Dec. three other pickings, and on the 14th of Jan. the present month, a still further picking; and a few more pods, ripe, may be found towards the first of February.

"The curiosity about the growth of cotton in this climate appears to be this,—till now it was supposed that our season was not long enough to raise cotton, and that immediately after the frost appeared no more could be counted on; but from the experiment here adduced, it will be seen, that so far from the frost destroying the vital parts of vegetation, it only stops its progress, leaving so much nourishment in the plant, that with the aid of dry, cold weather, every pod of any size, matures, expands and opens, like a chesnut burr; and the cotton, in point of staple and every thing else relating thereto, is fully equal to that produced before the frost made its appearance, with the single exception that the pods are not so large, and appear to be stopped in the growth, immediately after frost appears.

"To every person wishing to make the experiment, the writer would recommend that the ground be prepared as for corn; that the seeds be put into the hills about the same distance apart, and that not more than four or five stalks be suffered to remain in each hill; that the cotton be ploughed and hoed, in the same manner as corn, and if found to grow too luxuriantly, nip off the tops, and it will be found to yield more pods. It should never be suffered to grow above from three to four feet high; and be sure to plant early, as it is better to run the risk of having the first crop cut off with the spring frost, than be too late in planting; for if you can only get your plants well stocked with pods before the fall frosts set in, you need not be alarmed but that you will gather a plentiful crop.

DAVID DUNHAM.

A farmer in New York has raised the past year, from TWELVE old ones, four hundred and forty *Turkeys*.

A large eagle was lately shot from the top of a tree on the bank of the Delaware, having a fox trap attached to one foot, which had been missing from its place for five days or more.

In equivocal Epithet.—It is common, no days, to say the character of such a man is *ant-antagously* known. Query, does it in advantage to the individual spoken of, or others?—*Charleston Courier*.

A blind man on leaving a company of ladies said he was sure there was one present who had a fine set of *teeth*, for she kept up a continual laugh for two hours.

An Irishman being asked, how do you grow potatoes in Ireland? Faith, says he, we call 'em at all, for when we want 'em we get 'em.

NEW SYSTEM OF SHOEING HORSES.

JUST published, and for sale at the principal stores in this city, A NEW SYSTEM OF SHOEING HORSES, by JOSEPH GOODWIN, Veterinary Surgeon to His Majesty George IV. and Member of the Royal College of Surgeons; including Observations on Bleeding and the Pulse, a Concise View of the Anatomy of the Foot, Notes, Remarks, &c. Jan.

AMERICAN MANUFACTURED PAPER.

HOLBROOK & FESSENDEN manufacture at their Paper Mill, in Brattleborough, (Vt.) WRITING PAPER of an excellent quality, and much superior to any of a correspondent price imported. They also make Foolscap for \$4.50 a ream, not inferior to English paper which costs \$9.00 a ream. Their LETTER PAPER is also fine, and sold cheaper than imported paper of similar sort. Specimens may be seen at Mr. Loring's Bookstore, No. 1, South Row. Jan.

THE MENTOR AND LADIES' BOUQUET.

NATHANIEL DEARBORN respectfully announces to the public, his intention of issuing a Weekly Paper, provided their patronage should authorize the attempt.

This determination has been taken with the aid of many friends, among whom are some ingenious writers, which are enlisted for this cause;—it has also been strengthened by the circumstance that the editor's compositions have been deemed of sufficient value, generally, to be republished, which has been his reward.

It will be the intent of the editor, to advance every degree within his power, the rational pleasure of man;—to plead the cause of virtue;—to lure the youthful mind to love and to embrace those principles which can never satiate, but which ennoble the nature.

To our fair country women, we pledge our best efforts to promote their interests;—in every act in which we are able to merit their approbation. The paper is entitled *The Mentor and Ladies' Bouquet*.

Its general outline will consist of extracts from scientific works;—as a "Mentor," it will always contain some judicious moral essay;—and for the "Ladies' Bouquet," will be gleaned the choicest, fairest flowers.

Its size will be a royal quarto, pagged—issued on Saturday afternoon—Price, per year, \$2.50; half a year, \$1.25; quarter of a year, 75 cents;—payable in advance.

Subscriptions received by Col. Benjamin Loring, 50, State-street; Mr. I. W. Goodrich, No. 78, State-street; Mr. Josiah Loring, No. 1, South Row, and at C. M. Lender's Library, School-street.

Should public favor be expressed for the appearance of this proposed work, the same will be announced through the medium of the daily prints. Jan.

HUSBANDMAN and HOUSEWIFE, by THOMAS G. FESSENDEN, for sale at this Office. Fifty Cents. Jan.

THOMAS W. SHEPARD,

RESPECTFULLY informs his friends and the public that he executes all kinds of

BOOK AND FINE JOB PRINTING,

in the most fashionable manner, and on reasonable terms, at the Office of the NEW ENGLAND FARMER, ROGERS' BUILDING, CONGRESS-ST.

NEW ENGLAND FARMER.

Published every Saturday, by THOMAS W. SHEPARD, Rogers' Building, Congress Street, Boston; at \$2.50 per ann. in advance, or \$4.00 at the close of the year.

VOL. I.

BOSTON, SATURDAY, FEBRUARY 8, 1823.

No. 28.

AN ADDRESS

DELIVERED BEFORE THE MASSACHUSETTS AGRICULTURAL SOCIETY AT THE BRIGHTON CATTLE SHOW, OCT. 9, 1822. BY THE HON. TIMOTHY PICKERING.

Gentlemen of the Massachusetts Society for the Promotion of Agriculture,

It appears to be expected, that at each of your anniversary meetings, a discourse on Agriculture should be delivered. The Trustees of the Society have requested me to address you at this time. But though willing to be laid under contribution to the great object of your institution, it has occasioned a degree of solicitude to present something meriting your attention. From the multitude of books written on the subject of agriculture—embracing in that word whatever should employ the thoughts and the labors of the skilful husbandman—the field would appear almost boundless: yet to select topics particularly interesting to the farmers of Massachusetts, and here to discuss them so as to communicate useful and acceptable information, was not unattended with difficulty. My address must necessarily be miscellaneous.

Philosophers and practical husbandmen have for ages employed their thoughts and their pens on the various operations in agriculture; yet diversities of opinion still exist; and the reasons of many of these operations have been little more than conjectural. What constitutes the food of plants, has long been a subject of diligent inquiry. It was natural to suppose that if this food could be discovered, it could more easily be provided, or at least be more efficaciously administered. The palpable differences which distinguish the immense variety of plants, in their forms, textures, colors, and tastes, naturally suggested the idea, that each variety required its specific nourishment. Yet it being a matter of common observation, that the same soil would nourish and bring to maturity multitudes of different plants, of very opposite qualities—some yielding wholesome food, and others a deadly poison—at the same time all growing together, and robbing one another; a nobler and more simple idea presented itself—that the food of all plants was the same; but that each species was endued with the power of converting that food to its own peculiar substance: as among animals, the same grain produced all the varieties of flesh which go to sustain the life of man. In the vegetable kingdom, this supposed power of conversion seemed strikingly apparent in the effects of grafting of fruits. The juices imbibed by the roots from the earth, and immediately changed to the proper sap of the native stock, ascend and spread through all the limbs; and if each of these be grafted with a different fruit, the varieties will be as numerous as the branches.

By the modern discoveries in chemistry, these mysterious effects seem to be accounted for. For it appears that all kinds of plants are composed of a small number of elements, whose different arrangements and combinations produce all the varieties in question. Seldom more than seven or eight of those elements belong to

plants, and three constitute the greatest part of their organized matter. But each of these is a compound, consisting of the same materials, only in different proportions. The three principal ingredients in the food of plants, and which by them elaborated constitute the food of man and other animals, are named by chemists, carbon, oxygen, and hydrogen; in other words, charcoal, vital air and inflammable air; and these exist in the air we breathe, as well as in manures consisting of vegetable and animal matters.

It may seem incredible that the thin air, an invisible matter, should be changed, in the process of vegetation, into solid substances, as wood and stone: but nothing has been more clearly ascertained, than that in 100 parts of pure limestone, 45 parts are fixed air, or carbonic acid; which in the act of burning the stone into lime, is expelled; for if at that time the stone be weighed, it will be found to have lost so much of its original weight. It is also well known that this same lime, which slaked with water, or exposed to the air, falls down into a powder, will immediately afterwards begin to imbibe fixed air from the atmosphere, and eventually, though slowly, recover its original weight. It is this same carbonic acid, or fixed air, which at the bottom of wells, every year proves fatal to a number of lives. For this air, when separate, being heavier than the air of the atmosphere, sinks and remains at the bottom of wells, and is a deadly poison. It is the oxygen in the atmosphere, called also vital air, because essential to animal life, which mingled with the fixed air, renders the latter harmless.

I have introduced these few remarks on the food of plants, to present an idea—a very faint one indeed—of that very interesting subject; which, as already observed, has so long employed the thoughts of philosophers and agricultural writers; but the satisfactory discovery of which seems to have been reserved for the present age. This view serves to account for the vast variety of plants which will grow on the same spot of earth; the ingredients of their food being substantially the same, but varied in the proportions peculiar to each; and which each has the faculty of appropriating to its own use; rejecting the rest, or casting it off as excrementitious.

But although the same articles of food will afford nourishment to a variety of plants, yet these are so formed as to require a variety of soils, adapted to their several constitutions; some preferring a stiff, others a loose or light soil—some a moist and others a dry one. Few, however, will refuse a well compounded loam. Soils (like plants) however diversified in appearance, consist of different proportions of the same elements. Four earths generally abound in soils; and these, by chemists, are called aluminous, siliceous, calcareous, and magnesian; and of these the three first are the principal; and, in familiar language, well known to every farmer, as clay, sand, and lime. Magnesia is often found in limestones; and the combination is said to give the strongest lime for the farmer's use; so as in smaller quantities to serve his purpose,

as well as mill lime applied in much larger quantities.

The first object which claims the farmer's attention, is the nature or constitution of the soil. The next embraces the means of enriching it and preserving its fertility. That intimate mixture of clay and sand which is called loam, is the most desirable soil, as being already prepared for every operation in agriculture. A stiff clay demands opening by the addition of sand and other materials; and a sandy soil requires the addition of clay. But calcareous earth is considered as essential to give to soils the capacity of attaining the highest degree of fertility. Few soils, indeed, are wholly destitute of calcareous matter, though it may be invisible to the eye: but very few possess so large a portion of it as would be salutary. There can be little danger, therefore, of applying it to excess in Massachusetts, where so little in any form has been found. Limestone is the great source of calcareous matter. But this is of various qualities. Very little of it is purely calcareous. Some lime stones in Great Britain have been found to contain eleven parts in twelve of sand. Of such lime, if sixty bushels were spread over an acre of ground, five bushels only of calcareous matter would be applied. To know then the constitution of the lime he uses, is important to the farmer; and not less so to the mason in preparing his mortar, which will require the addition of more or less of sand, according to the composition of the lime. All marbles contain calcareous matter, and are of greater or less value, according to the proportion which this bears to the clay, sand, or other substances mingled with it. All shell fish will supply this material. In some parts of the United States, remote from limestone, oyster shells are burnt to obtain lime for building; and in all seaport towns where many oysters are used for food, their shells will be found in quantities deserving the neighboring farmer's attention; and if raised in piles, mingled with wood, may be burnt to lime.

Of the vast improvements of the lands in Scotland, within the last forty or fifty years, lime has been the basis; and the use of it the first step towards rendering the application of manures, strictly so called, highly productive. There they will lay from fifty to two hundred or more bushels on an acre. In Pennsylvania, where lime has been long and extensively used, twenty to fifty bushels to the acre has been found sufficient, and safer than any larger quantity, at least in the first application. A remarkable instance of the beneficial use of lime, though only at the rate of about twenty bushels to the acre, well merits a recital. The experiment was made on a field of ten acres, for which the farmer had provided two hundred bushels; but it being his first essay in using lime, it so happened that the whole quantity was disposed of when he had gone over nine acres. Indian corn was planted; and the crop was very great. The next year, the field was fallowed, and at seed time sown, a part with wheat and a part with rye; and good crops were produced. "In the Spring (says the farmer) I

sowed it with clover and timothy (Herd-grass) and put two bushels of plaster on an acre; and had as good a crop of clover as could grow; it was three weeks before the time of mowing; the fields—The lime and plaster did all this; for no land could be poorer before. Where I find no lime, I get no clover, although I put on the plaster.” The kind of soil in which lime operated so powerfully, is not mentioned; but probably it was clayey; a very common soil in the country where this land lay. Another like instance occurred in the Delaware State, on a clay farm, on which plaster produced no effect until the land was limed. While lime operates very beneficially on strong clays, it is said to be still more useful on lighter soils. To ascertain its effects on any lands, will require but little time and a small expense. A single cask of lime will be sufficient for a number of comparative experiments. If a few adjoining rods of land be set apart for the purpose, and the lime, by slacking, brought to a fine powder, it may be evenly spread on the several small strips, in different proportions, at the rate of twenty and any greater number of bushels to the acre. Then, by raking or harrowing, mix the lime with the surface soil, and plant each strip equally and uniformly with Indian corn. One equal strip, tilled and planted exactly as the others, but left unlimed, will enable the experimenter to see what advantage may arise from liming. In the next year the effects of lime in its respective proportions, may be further tested, by sowing the same strips with equal quantities of one sort of grain and of grass seeds.

In like manner, small experiments may be made to try the effects of clay on light sandy or gravelly loams, and of sand on stiff clays. The clay should be carried on and spread, and lie on the surface during the winter, to break and moulder by the alternate frosts and thaws, that it may be more effectually mixed with the soil.

As to the manner of applying lime, I am satisfied the best is that recommended and practised where lime has been most extensively used; that is, to slake it with water, and as soon as it falls to a fine powder and is cool, to spread it evenly over the land, and with the harrow mix it with the soil; its greatest utility depending on its intimate incorporation. In liming extensively, the lime is often, perhaps most commonly, carried on and dropped in small heaps, to be slaked by the moisture in the air; but it should be carefully attended to, that it may be spread as soon as it is slaked; or there will otherwise be danger of its setting in lumps, which may never again be duly pulverized.

If the application of lime be, as is represented, so important to the great and permanent fertility of the soil (and of this I entertain no doubt,) while the knowledge of the fact is all that is essential for the practical farmer to know; something more is desirable to satisfy inquisitive minds; and if the reason for using lime, or its mode of operating, could be shown, it would give confidence to the husbandman, while it gratified the philosophical inquirer.

A gentleman who is reputed to be one of the greatest chemists of the age (Sir Humphrey Davy) informs us that “when lime, whether freshly burnt or slacked, is mixed with any moist fibrous matter, there is a strong action be-

tween the lime and the vegetable matter, and they form a kind of compost together, of which a part is soluble in water;”—that “by this kind of operation, lime renders matter which was before comparatively inert, nutritive; and as charcoal and oxygen (vital air) abound in all vegetable matters, it (the quick lime) becomes at the same time converted into carbonate of lime;” that is, it is restored, by again combining with carbonic acid or fixed air, to the state in which it existed before it was burnt, except its being reduced to powder. Again he says—“Mild lime, powdered limestone, marles or chalks (for chalk is a lime-stone) have no action of this kind upon vegetable matter; by their action they prevent the too rapid decomposition of substances already dissolved; but they have no tendency to form soluble matters.” He then remarks, that “chalk, marle, or carbonate of lime, will only improve the *texture* of the soil; or its relation to absorption; acting merely as one of its earthly ingredients. Quick lime when it becomes mild, operates in the same manner as chalk; but in the act of becoming mild, it prepares soluble out of insoluble matter.” Again he says—“All soils are improved by mild lime, and sands more than clays.”

While quick lime, according to this celebrated chemist, is so usefully applied to land abounding in fibrous matter, to effect its speedy dissolution, he says its application should be avoided, where a soil contains much soluble vegetable manure; as it either tends to decompose the soluble matters by uniting to their carbon and oxygen, so as to become mild lime, or it combines with the soluble matters, and forms compounds having less attraction for water than the pure vegetable substance.

But an ingenious writer, under the signature of Agricola, in Nova-Scotia, says, that notwithstanding all these precautionary fears, the offspring of chemical creation, the British farmer is mostly in a habit of applying quick lime to all sorts of soils. And he assigns an adequate reason, that caustic lime cannot remain any length of time in the ground, without passing into a carbonate and becoming mild. This writer offers different reasons for the beneficial operation of lime: that it is capable of absorbing not only that quantity of carbonic acid which it possessed in its natural state (being 45 parts in 100) but an additional quantity; and can form what chemists call an hypercarbonate. This, he says, is highly soluble in water: which accounts for the admission of lime into the structure of plants; and that this excess of carbonic acid adheres very loosely to its base (the mild lime) and is liberated without any extraordinary degree of heat. The carbonic acid, a most important article of vegetable food, is copiously evolved in the putrefactive process of manures; the calcareous earth fixes and prevents its escape—forms with it a hypercarbonate, and readily imparts it in union with water, towards the nourishment of the crops. It is supposed to do more; it unites with the carbonic acid floating in the air; and when there is a scarcity of aliment in the soil, it seizes and secures this food in the atmosphere, and afterwards disperses it, according to the calls and necessities of vegetation. Hence the necessity of keeping lime on the surface. It is then ready to intercept, and combine, with the carbonic acid which is generated by the fermentation of the putrescent matter lying at lower depths, and to attract the

same gas (the carbonic acid) from the surrounding air.

I confess myself much better satisfied with the observations of Agricola, in accounting for the operation of lime, than with the solution offered by Sir Humphrey Davy. If the statement of the former be correct, we can see a reason for the long continuance of the beneficial effects of lime on land: for although it is not itself food for plants, it is constantly employed in collecting and imparting to them that food, from the sources which have been mentioned. Does not the reasoning of Agricola also indicate the cause why lime benefits sands more than clays? The latter are opened and rendered lighter by its application; and to destroy their too great tenacity, seems to be a main advantage gained by liming clay soils; whereas sandy soils are already sufficiently porous.

An old English practice of burning clay for a manure, has lately been revived in England, and with some appearance of novelty. The facts stated in regard to its operation, preclude all doubt of its efficacy. On stiff clays, it has, in the practice of some farmers, superseded the use of lime; because, although much greater quantities of it are required, yet being on the spot, in the very field where it is wanted, it is much cheaper than lime, for which the farmers are often obliged to send upwards of twenty miles.—It is said that clay thus burnt,—in which the process is so managed as to reduce the clay to the condition of ashes,—will not again, when wetted with rains, recover its original texture of a close compact substance too tenacious of water, and when dry, too hard for the roots of plants freely to penetrate. I have called the burning of clay for manure an old English practice: for I find an account of it in the second of Dr. Elib's Essays on Field Husbandry, written and printed in Connecticut upwards of seventy years ago. The Doctor gives a recipe, copied from an English book, for the process of burning it; which is with a *smothered fire*, a point of indispensable necessity, according to the present practice in England.

Many ways of improving lands, both in the manner of cultivating them, and in the kinds of useful plants to be introduced, have been often recommended; and certainly a spirit of improvement has been extensively excited; yet much remains to be done, to raise our crops to an equality to those in some European countries, whose lands and climates are no better than our own. But have we the means of accomplishing it? I answer, generally, that we have. Our animals for labor are equally efficient. Our instruments of husbandry are as good, or capable of being easily made so. Our husbandmen are as intelligent, and unquestionably less prejudiced, and less averse to adopt improved modes in farming. In England, a bigotted perseverance in ancient practices, however absurd, has in times past been astonishing. Her own writers inform us, for instance, that in one county all their common ploughing has long been performed with one pair of horses driven by the ploughman; while in an adjoining district four or five horses, in a single line have been put to the plough, with the addition of a driver, and yet ploughing no more land, nor with a deeper furrow, than was elsewhere effected with one pair of horses.

But although I suppose no prejudices equally strong exist among us, still we are, I think, too

* Memoirs of the Philadelphia Society of Agriculture, Vol. I. p. 193. Ibid, Vol. II. p. 107.

prone to adhere to old usages, where no good reasons can be given for them. New practices in husbandry are often—perhaps chiefly—attempted by persons not bred to that occupation, and these, for want of practical skill, may often fail in the execution; and when successful, the success is ascribed to a liberal expenditure of money, beyond the ability of the mere farmer. But what risk will attend experiments made by farmers themselves, to test the value of these novelties? Each one for himself can try them on as small pieces of ground as shall suit his convenience, and at a very small expense of time and money. The introduction of improvements would be facilitated, if the money expended, and especially the quantity of labor bestowed upon them, were always accurately stated, and their authenticity vouched by the names of the improvers. And if the experimenters, in these cases, who hire all the labor, and this often performed in their absence, are merely *not losers*.—practical farmers, always present, and working too with their own hands, would assuredly render such new practices *profitable*.

But I apprehend the knowledge of modern improvements in husbandry is far less extended than may commonly be supposed. That celebrated Travelling Agriculturist, the late Arthur Young, a man of science and literature as well as a practical farmer,—after visiting different tracts in England, for the purpose of observing, and for the information of his countrymen describing their various modes of husbandry, commenced, about the close of the American War, his *Annals of Agriculture*. He afterwards travelled over France and parts of Spain and Italy with the same views. Thus fraught with agricultural knowledge, he continued his labors in that work; comprehending, in addition to his own observations, useful communications from practical farmers, bearing their signatures, or it was a general rule with him not to admit any unless thus vouched; yet, if my recollection be correct, that practical work was so little tended to by English farmers, that he circulated its sales as not exceeding 500 copies. Since then, indeed, improvements have more readily been adopted, and agriculture has advanced with an accelerated pace, and in Scotland with great rapidity. *Reading*, to obtain agricultural information, has been extended, and become fashionable; and book-farming knowledge is no longer despised. This knowledge now of greatly increased value, because experiments, with a view to improvements, are not, as formerly, made at random, but on principles founded in the nature of things, and which rest on modern discoveries.

As we have no farmers who cannot read—in order to give to all opportunities of reading, I like leave to suggest for consideration, the expediency of forming, in each township in the State, a farming society, of which the members would meet monthly, to converse on farming affairs—to make mutual communications of their practices in husbandry—to commit to writing every practice not in common use, which may be beneficially extended—and to read and examine modern publications on their vocation, particularly those of the State Society, which the Trustees would gratuitously furnish. To these, such township-societies would find it preceivable and useful to add the best periodical publications which issue from the presses of our own country, either through the agency of

Agricultural Societies, or of well informed individuals. With these and a few other books on the subject, each township-society would become possessed, at a very small expense, of a pleasing and instructive agricultural library.

After considering the constitution of the soil he has to cultivate, the next object of the farmer will embrace the means of enriching it, and of preserving its fertility. To enrich it, manure will present itself as of the first importance; and of manures, the dung of his live stock will obviously occur as the most essential ingredient. If the manure from the droppings of his stock could easily be doubled, how great would be the farmer's acquisition? That this is practicable I cannot permit myself to doubt. I am rather inclined to think it capable of a manifold increase. At another public meeting of farmers, I had occasion to suggest some means of preserving and greatly increasing this important article; particularly during that portion of the year when cattle are at pasture, but penned at night in the barn yard. Nothing is more common than to see these yards, after being cleared of manure for the Spring crops, left naked until autumn, without litter or mud, or earth of any kind, to absorb the urine of the cattle and to mingle with their dung; but all is left open to our burning summer suns, by which the greater part, three fourths, perhaps seven eighths, of the essence of both are exhale and given to the winds. To prevent this serious loss, I suggested the expediency of giving to the barn yard, as soon as it was cleared out, a covering of any kind of litter, and a coat of earth, and from low grounds, loam where attainable, or any kind of earth to which a farmer can have easy access; and that as often as once in two weeks, a new coat of earth should be introduced. Weeds from road sides and waste places would make valuable additions to the summer manure. By such means manure may be increased in a four, perhaps an eight-fold degree.

But if in addition to this accumulated summer manure, the farmer, without any of the dung or litter of his cattle, could double the quantity usually made during the winter, would he not consider himself enriched? That this is practicable will appear from a statement I shall now recite; it being the result of careful experiments made in Scotland during a period of ten years. The fact is stated in one of a series of papers written with great ability by Mr. John Young, under the signature of Agricola, (already referred to) and published at Halifax. The urine of cattle produced this mighty effect. I cannot so well occupy your time as by giving the statement in his own words, as abridged by him from the Farmers' Magazine, published in Scotland.

"I should be afraid (says Mr. Young) to hazard my character with the public, by stating in round and unqualified language, the value of this rich juice which is literally wasted and thrown away; and therefore I shall proceed with caution, and give a detail of facts, conclusive in their bearings, and substantiated by the best authority. They are contained in a letter* from Charles Alexander, near Peebles, in Scotland; and are addressed to Sir John Sinclair in 1812, for publication. This intelligent farmer had long been impressed with the great impor-

tance of the urine of cattle as a manure; and he sets about to discover, by a long and well conducted series of experiments, the best method of collecting and applying it. He began by digging a pit contiguous to the feeding stall, but distinct altogether from that which was appropriated for the reception of the dung. The dimensions of this pit, according to his own account, were 36 feet square, and four feet deep, surrounded on all sides by a wall; and the solid contents were 124 yards. Having selected the nearest spot where he could find loamy earth, and this he always took from the surface of some field under cultivation, he proceeded to fill it; and found that with three men and two horses, he could easily accomplish 23 cubic yards per day; and the whole expense of transporting the earth did not exceed £1. 16. 0.* When the work was complete, he levelled the surface of the heap, in a line with the mouth of the sewer which conducted the urine from the interior of the building, on purpose that it might be distributed with regularity, and might saturate the whole from top to bottom. The quantity conveyed to it, he estimates at about 300 gallons; but as this calculation was founded partly on conjecture, for he measured not the liquor, it will be better and more instructive to furnish and proceed on *data* that are certain and incontrovertible. The urine was supplied by 14 cattle, weighing about 34 stone each,† and kept there for five months on fodder and turnips. The contents of the pit produced 268 loads, allowing two cubic yards to be taken out in three carts;‡ and he spread 40 of these on each acre; so that this urine in five months, and from fourteen cattle, produced compost sufficient to fertilize seven acres of land.§ He states further, that he tried this experiment for ten years, and had indiscriminately used, in the same field, either the rotted cow dung, or the saturated earth; and in all the stages of the crop he had never been able to discover any perceptible difference. But what is still more wonderful, he found that his compost lasted as many years as his best purest manure; and he therefore boldly avers, that a load of each is of equivalent value."—The dung pit, which contained all the excrementitious matter of the 14 cattle, as well as the litter employed in bedding them, and which was kept separate for the purpose of the experiments, furnished, during the same period, only 240 loads; and these, at the same rate, could manure only six acres."

On this statement one remark forces itself into notice. That for the want of such a reservoir for saving the urine of our cattle, more than half of our winter made manure, and this is the farmer's chief dependence, is lost.

It is not stated whether the pit niled with loam was or was not covered: but unless covered, rains would saturate the earth, and thus in a manner exclude the urine conveyed to it from the cattle stall. It should also be noted, supposing the pit to have been covered, that the frosts in Scotland would seldom so freeze the earth in the pit as to prevent the absorption of the urine. The frosts in Massachusetts

* £21 31. Seven days work for three men and two horses; each horse, I suppose, in a single cart, a common usage in Scotland.

† This would be the weight of a cow.

‡ This is 16 cubic feet to each load.

§ Seven Scotch acres are nearly equal to nine English and American acres.

would doubtless require that the pit should be sunk to some depth, and certainly be under cover. In a word, a barn-cellar would seem to be the proper receptacle for this important manure. How it should be arranged, must depend on the situation of the barn. In Pennsylvania, barns, which are commonly of stone, are often erected by the side of a hill, by which means a story is gained for their cattle stalls. By digging where there is a gentle slope, a sufficient excavation for a barn-cellar would be easily made, to drive in a cart on a level, for carrying in the earth in autumn, and for removing the manure in the spring. With the increased fertility of his soil, the farmer will be able to increase his live stock; and the live stock, in return, will be constantly adding to the productions of the soil.

In respect to **LIVE STOCK**, it is gratifying to see the spirit excited within the last five or six years, to attend to their melioration, by preserving some of the most promising for breeders, instead of sending them to the shambles; and by introducing from other countries some individuals already highly improved. New England was originally granted to merchants of Plymouth, in the county of Devon, in England. It is natural to suppose that some of the early settlers sailed from Plymouth, and brought with them the Devon breed of cattle. The uniform red color of various shades, some deep red, and approaching to brown, now so commonly seen among us, are probably descendants from the Devon race originally imported. Their uniform red color corresponds with a distinguishing mark of the Devon breed, now so highly improved and celebrated in England. Among our own, individuals of this stock might be selected, admitting, with equal care, of equal improvements, on the principles now so well understood by the eminent English breeders, who, Mr. Arthur Young has said, are indebted for them to the celebrated Robert Bakewell. On the same principles all our other domestic animals may be improved. And this course appears to me indispensable for the speedy attainment of extensive improvements of our stock, of neat cattle especially. More than one generation must pass away before highly improved races, from the few imported animals, can be generally obtained. In this important work every substantial farmer in the country ought to engage; and by their rival efforts in every county, the great object might be accomplished. Beauty of form is desirable, and will merit attention: but strength for labor and ample supplies for the dairy, are more important. A disposition *to fatten at an early age*—a point of excellence zealously sought for in England, where husbandry labors are chiefly performed by horses, is not of material consequence to New England farmers, where oxen for the drought and cows for the dairy constitute their most interesting stock. But what shall farmers, who live remote from a veal-market, do with their surplus calves, above the numbers of the best selected to keep up their stocks, and to supply those whose situation may induce them to purchase, and not breed for themselves?—I will mention what was some years since stated to me as the practice of a respectable farmer in Connecticut. He had cows for a large dairy, and cheese-making was his object. He allowed his supernumerary calves to suck their dam three days, (or until the milk

was fit for the dairy) and then killed them; taking off their skins, and giving their flesh to his store-hogs. This was to me a singular instance of practice; but from the good sense of that farmer, I conclude he must have experienced it to be not merely a necessary but a saving practice. It may be in use among other great dairy farmers, although I do not know that it is.

The Trustees have already offered a premium to encourage the making of **FINE BUTTER**. But I am inclined to think it will be difficult, if not impracticable, to make any of the greatest excellence, during summer, without the aid of ice-houses or spring-houses. The city of Philadelphia is admitted, I believe, to be supplied with *some* butter, during the warm months, superior to what is found in other cities of the United States. Yet their pastures are not better than those in the vicinity of some other cities and towns. I ascribe this superiority exclusively to the spring-houses on many of the farms in the neighborhood of Philadelphia. Pennsylvania is a well watered country. There it seems to have been an early practice, in taking up land for a farm, to search for a spring; and as near to it as the ground would permit, regardless of its situation in respect to the public road—to erect the dwelling house. Here the cattle, as well as the family, would at once find good water, without the labor of digging a well. Over these springs small houses are erected usually of stone. The room of the spring-house may be from ten to twenty feet square, according to the quantity of milk to be provided for. Trenches are made on the four sides of the floor, and bottomed and lined with flat stones. The residue of the floor is likewise paved with stones. The water from the spring enters at the side of one trench, runs all round, and at the opposite side passes away at a hole left in the wall. The under side of the hole is at such a height above the bottom of the trenches, as to raise the water just enough to keep the milk cool in the pans which are placed in it. This water runs perpetually from its source, and as constantly passes off at the outlet. In one of the trenches are also set the cream pots, and the pots with the butter the night before it is carried to market. Perhaps in the vicinity of Boston and other towns in the State, there may be some springs which may furnish the same accommodations.

Much has been said and written concerning an evil which pervades our whole country, from one extreme of the Union to another—the general use of spirituous liquors—prevailing, in the opinion of wise and good men, to a mischievous excess. Sometimes it has been hoped that Agricultural Societies might find means to check the pernicious practice. But the class of farmers who abstain from it must be too numerous to become candidates for premiums on temperance. Besides, such prudent men need no remuneration for their abstinence. Here virtue is indeed its own reward.

It is said that in France and Spain the laborers in husbandry are remarkable for their temperance: but they drink small wines instead of ardent spirits. A French gentleman who for some years was endeavoring to establish vineyards in the Middle States, particularly in Pennsylvania, once mentioned to me how cheaply the French peasantry could be regaled with wine, purchasing a bottle for a few pence. At the

same time, in answer to my question, he admitted that such wine was not equal to good American bottled cider. It has occurred to me that nothing might be so likely to check, and in good degree to supercede the general and excessive use of ardent spirits, as the universal introduction of

GOOD CIDER.

Were this beverage as well made as easily it might be, it would be alike palatable and wholesome; and in the end might banish spirituous liquors from the houses of the great body of our citizens. Good cider might be furnished at half the expense of strong malt liquors; provide apple orchards were more extensively cultivated, and the fruits intended for cider properly selected. We have a great deal of bad cider, because sound and unsound apples are ground together, and no regard is paid to fermentation except to give it vent. No one can suppose the juice of rotten apples capable of becoming cider. But in whatever degree they are introduced, in the same degree the liquor must be debased. To make the finest cider, sound apples only should be used. But I must not enter into the minute particulars of the process of making an managing cider—it would not comport with the occasion, nor be practicable within the limits to which this discourse must be confined. I will barely suggest a few things which involve some principles.

In every orchard are found a great variety of apples generally used for cider. In New England I presume these are chiefly wild, that is ungrafted fruit. And I have heard the opinion expressed, that such wild fruit would make the best cider. This surely is an error. For although in a large orchard some good natural fruits may be found, yet many of the trees produce apples so small as to cost too much labor to collect them, and others have juices so meagre as when collected to be of little worth. A few sorts which in England have been celebrated for yielding the finest ciders, were always grafted with as much attention as apples designed for the table are with us. But in England, the apples which a century ago furnished ciders of distinguished excellence,—to use the expressive words, in like case, of some of our own farmers—*have run out*. They can no longer be continued by grafting. This well known fact in the country, has led an eminent naturalist there to advance the novel doctrine—doubtless as true as novel—that trees, like animals, have the infancy, youth, maturity and old age. Grafted from the last, though inserted in young stock, soon perish. Hence the farmers there have been seeking for fine cider fruits from new trees growing from the seeds; and when any of these are found to possess the desired qualities they are propagated and extended by grafting.

In some parts of New Jersey, in which ciders of superior excellence are made, the farmers produce them wholly by grafting: nor can we expect fully to rival them, until we adopt the same practice.

Perhaps there are few extensive natural orchards in Massachusetts in which valuable cider fruits may not be found, with rich yellow flesh capable of yielding liquors strong and of excellent flavor. From such trees, if still young, in vigorous life, whole orchards might soon be formed. And probably different kinds might be selected which ripen their fruits at the time

most proper for making them into cider. Apples until mellow do not attain their highest flavor; and till then cannot give the highest flavor to cider. Many reach that mellow-ripe state in October and November, which may be called the cider-making months in Massachusetts. It would require but little attention to select and propagate the best apples thus ripening in succession. Such ciders, made of ripe and unmixed fruits, would be more easily managed in the most difficult and important part of the process of cider-making—its first fermentation; on the right or wrong conducting of which the character of the cider depends. In one case it will be soft and pleasant—in the other hard and austere.

The Trustees of this Society have, I believe for several years, been offering a liberal premium to encourage the

TURNING IN OF GREEN CROPS,
as a mode of manuring land: but I do not recollect that the premium has been claimed. It has been an ancient practice in other countries; and is not unknown in our own country. Dr. Eliot (whom I have already had occasion to mention) noticed it seventy years ago, in his *Essays on Field Husbandry*; and recommended millet as a plant well adapted to that purpose. The seed being but little bigger than cabbage seed, a small quantity will be sufficient for an acre. I have often heard of the turning in of Green Crops being occasionally practiced in Pennsylvania. Many years since, an intelligent man of that State mentioned to me a farmer, who had purchased a farm in a township remarkable for the general poverty of the soil; and that he improved his own by ploughing in green crops—buckwheat, oats, rye;—turning them in repeatedly, until the land produced crops worth harvesting. Sir John Sinclair, in his *Code of Agriculture*, speaks of the practice of ploughing in buckwheat and other crops, when manure was deficient. But he says that in Lincolnshire, buckwheat had for several years been ploughed in as a manure, and ultimately given up as doing no good. He then adds—"Unless so far as nourished by the atmosphere, the vegetables thus treated are supposed merely to restore the nourishment obtained from the soil." And this is the very principle on which the ploughing in of green crops materially depends. The plants while growing derive a portion of their food from the air; and being turned in, so far at least add manure to the soil. But this is not all the benefit: weeds spring up with the sown green crops, and are sown in with them; thus increasing the manure, and at the same time cleaning the ground for a harvest crop. But besides the growing plants, the soil itself, under their shade, made light by the ploughing and harrowing, is also receiving a portion of the same fertilizing airs. Lord Kames, however, in his *Gentleman Farmer*, says—"I approve not of ploughing down buckwheat, red clover, or any other crop, for manure. The best way of converting a crop into manure is, to pass it through the body of an animal. The dung and urine, not to mention the profit of feeding, will enrich the ground more than to plough down the crop." Notwithstanding these authorities—and the opinion of Lord Kames is entitled to very great respect—I am inclined to think that the circumstances and condition of many farms may be such as to render the

practice eligible; particularly when manure is deficient:—and where is it not deficient? Is it not a received fact, when lands have been impoverished by cropping without manuring, that by letting them lie a few years *at rest*, they acquire such a degree of fertility as to bear a crop of some sort that rewards the farmer's toil? If this happen to unseeded land, thrown out as waste, how much sooner may it be recovered when sown with buckwheat, oats, rye or millet, and the crops when in full blossom ploughed in? If this product be small, let the land be again sown, and a second crop be ploughed in. And if a third sowing and ploughing in were given, what would be the whole expense? A trifle compared with a dressing with stable or barn yard manure—if it could be procured. This is to be carted to the field and spread, in order to be ploughed in: but the green crop is on the ground, and evenly spread, ready for the operation of the plough. But leaving all theoretical reasoning, I will recur to well authenticated facts.

The late distinguished agricultural writer, Arthur Young, Secretary to the English Board of Agriculture, so lately as the year 1811, delivered before that body an interesting lecture, to describe the husbandry and speak the praises of three celebrated British Farmers. One of these was Mr. Duckett, who occupied in succession, two "sand farms;" that is, farms in whose soil sand was predominant. It was one of the practices of this very ingenious farmer, to plough in green crops to enrich his land. And to do it effectually, he contrived a plough with which, when drawn by four horses, he could open his furrows to the depth of eight or ten inches, and in them perfectly bury his green crops. The opening of so deep a furrow was called *Trench-ploughing*; and by the simple addition of an arm partly curved, and fixed on the right side of the coulter, at the desired height of eight or ten inches above the sole or bottom of the share, the growing crop was pressed to the ground; and the furrow-slice raised by the plough, following close behind and turned completely over, perfectly buried the crop and weeds. This coulter of Duckett's trench plough, with the curved arm attached to it, is called a *skim-coulter*. The arm must necessarily extend so far to the right as the breadth of the furrow; and just at that extreme, I conceive, the curve downward begins, so as, when the growing crop is pressed flat, the stems or straws may not spread out any further; and being thus confined, are completely overwhelmed. Hence there would be no vegetation in the seams of the furrows. "By means of this tool (says Mr. Young) I have repeatedly seen on his farm, stubbles completely turned down, and crops of turnips, tares and other plants instantly put in; which crops I have afterwards viewed with equal pleasure and surprise; the execution was as complete as the design was sagacious: but it went further—converting the nuisance of any weeds into manure. So effective was the work of the plough, that I once saw him turn down a crop of rye six feet high, and immediately roll in turnip seed. The effect did not depend so much on an extraordinary depth of ploughing, as on the subversion of the soil; for of the rye I have just alluded to, not an atom was left visible; and yet the depth did not exceed eight inches. But if there be Couch [twitch grass]

in the soil, this ploughing is ten inches deep; and the succeeding crop in any case well handled. This trench-ploughing system is not practiced above once in two or three years, and the successive tillage shallow, upon the surface. By such deep ploughing, seldom given, Mr. Duckett conceived that a due degree of moisture was preserved in his light land; by means of which his crops were flourishing in seasons of drought which destroyed those of his neighbors."

Here perhaps the question will occur—were Mr. Duckett's improvements adopted by other farmers? Mr. Young says they were, by some of his enlightened brethren. Why they were not generally imitated, Mr. Young ascribes (I repeat his words) to "the perversity which characterizes the ignorance of English farmers." Again he says, "If our farmers would have adopted the practices really excellent, as soon as they were known, British agriculture would forty years ago have arrived at its present state; and at this time the kingdom would have been a garden."

In connexion with this account of Mr. Duckett's practice, I take leave to suggest the necessity, or at least the great utility, of an occasional fallowing; primarily, in order to destroy the weeds which infest so many fields, and essentially injure all crops of small grain, especially spring wheat, which ripening more slowly than rye and barley, is much more oppressed by the weeds. In effecting the object here suggested, and to enrich the soil while making a fallow, I would recommend the following mode of practice. As soon as it can be done in the spring, plough, sow and harrow in the seed of the crop intended to be turned in. Weeds will spring and grow with the crop.—When the latter is in full blossom, turn it in. Immediately sow for a second crop. With this also will arise another crop of weeds; and both, as before, are to be turned in. Should the season permit, and the foulness of the ground require it, sow for a third crop, to be ploughed in, like the former, before winter. A field thus managed will be in good order for a crop of barley, summer wheat, rye or oats, in the ensuing spring; and of either a comparatively clean crop may be expected.

This dressing with green crops, valuable as I conceive it to be, need not be confined to sand farms; it will be not less beneficial in all light gravelly loams, which I suppose rather to abound in Massachusetts; certainly, stiff, clayey loams are not common.

A few concise remarks on the general principle, and on some of the objects of these annual exhibitions, will conclude this address.

It is supposed, and justly, that these public shows, by exciting an emulation among farmers, will lead to important improvements in our husbandry. The general question which the case presents, is, What will be the easiest, cheapest, and most effectual means to accomplish this great object? A principal one has been to grant premiums for the greatest crops of specified plants on given quantities of land. One pleasing result has appeared—that by ample manuring and good culture, the usual crops of the same plants may be doubled and trebled. But is it necessary to continue premiums of this kind? May not now the management of farms rather claim attention? Instead of numerous small pre-

miums dispersed on a variety of objects, might they not be advantageously concentrated for the purpose here intimated—the cleanest, most economical, the most productive management of farms? For it must be such a general improvement of the entire farm that will constitute the farmer's permanent prosperity. The decision of claims on this ground cannot be expected to be made by a committee of this Society to travel through the whole State: but will it not be practicable by county committees? Perhaps it may not be difficult for the Trustees of the State Society to prescribe some general principles and rules of proceeding, that may produce uniformity in the reports of county committees acting under their direction.

In ploughing, the just aim must be to make straight furrows, and of a uniform breadth and depth; and so turn over the furrow-slice as completely to cover whatever plants or manure are upon it. All this cannot be effected with a hurried step. And what benefit can possibly result from such a step? A farmer's oxen at the plough must labor a great part of the day properly to turn over an acre. To do this without a driver, will require a skilful ploughman and well trained oxen. To encourage the forming of such ploughmen and oxen, should, I conceive, be the sole object of ploughing matches. Working-oxen at the plough, may be considered as well trained when they obey the voice of the ploughman, keep the track in which they ought to move, and step as quick as will be compatible with the necessary continuance of their labor. And as the annual exhibitions at this place have demonstrated the practicability of performing the general operations of the plough with one yoke of oxen, without a driver, it may merit consideration whether premiums should not be thus limited in all future trials with the plough. Under such limitations, every farmer who is ambitious to exhibit proofs of superiority in these points, would be sensible that his oxen must attain a certain size, and be, though not fat, yet well fleshed; which would give strength to their sinews and momentum to their exertions. With such oxen all our agricultural labors would be so well performed, that there would be no room to envy the condition of farmers in any of our sister States; in some of which, their horses consume perhaps as much grain as would furnish bread to all the inhabitants of New-England.

FOR THE NEW ENGLAND FARMER.

MR. FESSENDEN,

The improvements in agriculture which have recently and generally been adopted in our country, while they evince the intelligence and enterprise of the farmer, have given him pre-eminence among the benefactors of the commonwealth. He has acquired the skill of improving his soil, and possessed himself of the best implements for its cultivation. He is judicious in his rotation of crops, best adapted to the soil in reference to the succession. He prepares his seed in the best manner, and sows it at the season most favorable to vegetation, and with a liberality which promises the greatest abundance. Thus far is well, and gives a fair indication that the details of his whole system are in unison. Still I am apprehensive that most farmers are too inattentive to the most essential requisite in good husbandry—I mean in the selection of their

seed, generally, but particularly to the purity of the kind sown, broadcast, upon their best prepared soil. One error, here, may mar our whole system, and render our skill productive of as much evil as good. On poor and worn out land, the evil of sowing a mixture of impure seed, with grain or grass seed, would be great—but where the ground is in high order, the crop is more injured; the noxious plants take firmer hold, and are more difficult to be eradicated.

I have known farms, otherwise well cultivated and productive, incalculably diminished in their value from neglect in this precaution. I have seen fields of grain in such full blossom with wild turnips, as to appear the standard crop. I have seen others so choked and entangled as to render it doubtful whether the culture of rye or tares was intended. I have further seen extensive enclosures of luxuriant grain overtopped by the gaudy and luxuriant Canada thistle, or more stately dock.

I have no objection to the owners of these farms regaling themselves and their cattle with this nauseous mixture, if it best suits their taste—but I protest against their vending it to others for food—more especially for seed. In the latter case, they do an act, worse than most things which are considered *frauds* in other transactions. To sell me a diseased animal, as sound, would be a small injury compared with the selling me a bushel of oats with the mixture of an ounce of tares or wild turnip seed. The animal might die, and I should lose only my money, and some expense in endeavoring to save him; but my farm has received a malady of which it cannot be cured for years, nor ever, without much expense of time and labor.

These sentiments, in the abstract, will appear pertinent to every judicious farmer—but I fear there are many, like myself, whose reflections have been called to the subject by experience. Making it my rule that nothing should be suffered to grow which injured the crop, my vexation was extreme when in two instances the grain which I had purchased for seed communicated a profusion of wild turnip to my ground. By great care and diligence through the summer, I in both instances succeeded in preventing a further spreading—but the time spent, and the injury to my grain in eradicating it, made a deduction of nearly half the value of the crop, besides a further trouble from the seed which was brought to vegetate in succeeding years. In the spring of 1821 I laid a field down to grass with rye. Learning that a farmer in town had raised a rare and valuable kind, I purchased, at an enhanced price, a supply for sowing. The grain appeared well; but so beset with tares that it was useless to attempt to pull them out. After harvesting I dug up what roots I could find, and secured many of the unshelled pods. Instead of mowing the grass the present season, as I intended, I turned in my cows to prevent the further seeding of this baneful plant. In this case the damage was not only great, but what is worse, there is no calculating its duration.

There was culpable error, I admit, in sowing any grain without carefully examining it. This negligence is too common. The only palliation in my case, was, that I purchased it of persons who pass for good farmers. But the security of having good seed ought not to depend upon the inspection of the buyer. If he is vigilant

himself, he may often be under the necessity of entrusting his business to others who are unfaithful. The seller, if he raises the seed knows whether it be impure. If it is so, it is fraud; for the consequence of which, he ought to be made liable. But whether he raises it or not, if it is bad, the effect is the same to the purchaser; and the vender should be answerable.

In England, wholesale venders of seed are required by law to brand their casks with their names; and all who sell are responsible to the purchaser if the seed is bad. In this commonwealth, where agriculture is so liberally patronized by the Legislature, a law of this kind is obviously required and expected. The first dawnings of this kind, in that body, upon the subject of the Canada Thistle, are hailed with pleasure. But it is hoped that while they are endeavoring to expel a foreign enemy, they will not be unmindful of domestic foes, more insidious and destructive.

Yours, with respect,

O. FISKE.

Worcester, January 15, 1823.

THE FARMER.

BOSTON:—SATURDAY, FEB. 8, 1823.

Mr. Pickering's Address.—We are sure that our columns could not have been better filled than with the able Address of the Hon. TIMOTHY PICKERING, which occupies most of the pages of our present number. It is true that many of our readers will be furnished with this valuable paper from the Massachusetts Agricultural Repository, in which it originally appeared. But there are others, who, it seems, have for some time been waiting with solicitude for its appearance in our paper. We have repeatedly been requested to furnish it, and are now happy in complying with the wishes of our friends, who have made such applications.

We are somewhat at a loss how to express our opinion of this Address in such a manner as to convey our real sentiments; and at the same time avoid the appearance of that kind of encomium which often displeases men of merit. We shall, however, venture a few words, with a disposition to say no more than truth justifies, and justice demands.

Although the subjects of the Address are not only important, but many of them abstruse, forming what may be styled the metaphysics of chemistry and physiology; still there appears to be nothing in Mr. Pickering's observations, which is hard to be understood.—Volumes after volumes have been written on the food of plants; the elements, or chemical constituents of vegetables; the mode of operation, the manner of applying, and the benefits resulting from the application of lime; the different kinds of earth necessary to constitute fertile soils; the burning of clay for manure; the obstacles, which prejudice, and a pertinacious adherence to old usages oppose to improvements in agriculture, and the best means of overcoming such obstacles; the best methods of accumulating and applying manure; methods to improve the different breeds of live stock, &c. &c. But we do not remember ever to have seen so many, and such important topics comprehended in even more than double the number of pages containing Mr. Pickering's remarks on these subjects. But, though the progress of the orator was necessarily rapid, from the great extent of the field, which he undertook to survey, he was able to shed new light on every object which came in his course. In short, we never read an agricultural essay, which, in our opinion, exhibits so

such useful matter in so short a compass. We think it should be a subject of congratulation with every friend to his country, that an eminent statesman and revolutionary patriot should be induced to exert his influence, employ his time, and devote his talents to promote the interests of agriculture, the most noble of the sciences, as well as the most useful of the arts.

The Editor has received a letter from Mr. Kenrick, of Newton, accompanied with a very acceptable present of a bottle of his Currant Wine, or "Columbian Croiselle." Mr. Kenrick states that this wine is sold by the keg at \$1.08, and by the barrel at \$1, per gallon, and at \$5 per dozen, white at \$6.50. We do not profess any connoisseurship with regard to wine, and can only say that the sample sent us was very agreeable, not only to our palate, but to the palates of some friends, whom we employed as *tasters* on the occasion. We therefore cheerfully recommend it as a pleasant, palatable, and we doubt not wholesome beverage.

Mr. Kenrick further remarks, that, "the facts collected by Col. Pickering, in regard to the best time for felling Timber, I consider of very great importance. Mr. Cooper told him that white oak, as well as hickory, felled in barking time, would not be bored by worms. I wish that some of your correspondents, who are high the salt water, would undertake to make experiments on yellow and white pines, hickory, chestnut, and every sort of oak used in shipping. Samples could be felled and sunk in water now; and similar samples should be felled in barking time, and placed side them. If I am not mistaken, nearly all the stumps in West Boston bridge were soon ruined so completely by worms, as to require replacing. I believe they were originally white pine.

"I am about entering on a course of experiments to ascertain the cause, in a satisfactory manner, why the worms, both on dry land, and under water, prey upon hickory and other wood felled in the winter season, but not when felled in barking time. If I succeed I will give you the result; and if you have a trusty friend that will make the experiment under water, we will be able to give the public information of the high importance to every section of our country."

The Editor would be greatly obliged to any friend who would make the experiment suggested by Mr. Kenrick, and would give his personal assistance so far as his indispensable avocations would permit.

FARMER SUMMARY OF NEWS.

CONGRESS appears to be pretty diligent in ways of doing, and will make, it is hoped, a good job of its legislative proceedings the present session. The Joint Office committee, on motion of Mr. Holmes, has been instructed to report on the expediency of transferring the principal Eastern mail in steam boats. They appear to be instituting a sharp look out relative to money matters, and do not intend that that the garb of patriotism shall be used as a cloak for speculation. They have, likewise, a bill on the carpet to provide for admission of persons as revolutionary pensioners. These applications have been rejected in consequence of the largeness of the property, but have since become more numerous. Their business, however, chiefly consists of details of important but not general interest.

MASSACHUSETTS LEGISLATURE will, we believe, close its session on Tuesday next. The bill relative to Imprisonment for Debt has been negatively voted. The bill concerning the Boston House of Industry, has been completed. A bill has passed to regulate the goat at large of sheep, rams and goats at certain seasons of the year. A bill further to regulate the practice of Physic and Surgery has passed to be enacted. The bill imposing a duty on auction sales has passed. The bill respecting religious freedom has been postponed indefinitely. A bill passed to be enacted, authorizing officers of the poor to act as guardians.

FOREIGN.—The latest news from Havre comes down to the 15th December. The appearance of the political horizon in Europe is less ominous of war than at the preceding accounts. Spain, it is said, is to be left to her own management, and France has ordered her troops, destined for that country, to rest upon their arms for the present. The Constitutionalists in Spain continue to be successful. The Greeks are likewise triumphant. Chourschid Pacha had a fresh defeat on the 23d, 23d and 24th of October—lost 700 men, and retreated to Larissa.

DOMESTIC.—According to a statistical table, the distance between Washington City, and the new Colony contemplated at the mouth of the Columbia river, is almost the distance between Washington and London.

Mrs. Rebecca Long, of Concord, N. H. and one of her daughters, were, not long since, poisoned by some white lead having been accidentally mixed in a quantity of sugar. Their sufferings were prolonged and very excruciating. [An English medical writer, whose name is not now recollected, states, that "when mineral poisons, technically called oxides, are taken internally, one table spoonful of powdered charcoal is a complete antidote, mixed with either honey, butter or treacle, taken immediately; within two hours administer either an emetic or cathartic; in this way the effect of the poison is prevented." We do not, however, presume to vouch for the efficacy of this remedy, but submit it for the consideration of medical men.]

The Albany Daily Advertiser of the 23th ult. states that the Albany stage was overturned in the Highlands on Friday, and one of the passengers, a gentleman from Vermont, had his collar bone broken, and several others were more or less injured. The accident was caused by the driver's attempting to pass an opposition line.

Large Hogs.—William Yale, Esq. of Meriden, Conn. fattened and killed on the 6th Jan. five hogs, weight as follows: 462, 476, 484, 486, 542—in all 2150.

Indians of butter have been sold at Montreal, which, after penetrating two inches below the surface were found to contain a mixture, fit only for the soap boiler.

A gang of counterfeiters of Spanish milled dollars has been discovered in Lower Canada, in the neighborhood of Montreal, and two of them apprehended. The dollars, it is said, were extremely well imitated. A gang of robbers, which had carried on its depredations for some time in the neighborhood of Montreal has likewise been detected and committed to prison.

Fire.—A new grist mill with two iron stamps, belonging to Mr. Robert T. Shaw, of Lansing, N. Y. was destroyed by fire on the 9th ult. in consequence of the carelessness of the miller.—The Congregational Church in the village of Great Barrington, (Mass.) was discovered to be on fire on the 13th ult. The fire had obtained a formidable ascendancy, when the building, and probably the whole village was preserved from destruction by the intrepidity of Mr. Gilbert Ford, who mounted the roof at the hazard of his life, and poured water on the spot where the flames issued most copiously. The fire is supposed to have been communicated from a small wooden box, containing ashes, into which some of the female part of the congregation had probably emptied the contents of their stove-pans the day previous.—On the 26th ult. a barn, containing 200 bushels of wheat, a quantity of oats, and hay sufficient to winter a large stock of cattle, was consumed in Addison county, Vermont. The fire was communicated by Sylvester Hanks, son of the sufferer, who, having deliberately set fire to the building, was the first to give information. He was arrested and sent to Middlebury jail.—A grist mill belonging to Gen. Stephen Van Rensselaer, at Albany, was lately consumed by fire. Damages estimated at \$25,000.—On Friday, of last week, several valuable stores, in Norfolk, Va. were destroyed by fire, and a Mr. Talbot, in whose store the fire originated, perished in the flames, and several other persons were seriously injured.

The following appointments have been made by the President, and confirmed by the Senate, viz: General Jackson, minister to Mexico; Cesar A. Rodney, minister to Buenos Ayres; Richard C. Anderson, minister to Colombia; and Herman Allen, minister to Chili. A young married lady was lately killed in Westmoreland County, Va. while riding in a gig, by the falling of a tree upon the carriage. Two of her children and a servant maid were in the gig, and were providentially unhurt.

DIED.—In Cambridgeport, on Wednesday evening last, SEYMOUR TYCEN, Esq. Representative in the Legislature of this State, from Brimfield.

In Albany, Moses L. Coe, Esq. senior editor of the Argus.

In New York, Mr. Joseph Tyler, aged 73, the oldest member of the Dramatic Corps in the U. States.

FOR sale at the Agricultural Establishment, No. 20, Merchant's Row, a general assortment of the most

APPROVED FARMING TOOLS—viz.

Harrison's Corn Shellers; Straw Cutters; double and single mould board Ploughs, of various kinds—Peckson's Cultivators—Dennett's Broad Cast Machine for small seed; extra cast steel broad and narrow Hoes—Foster's best English Shovels—Ames' back strapped do. Cam's English cast steel warranted Scythes and Hay Knives; Brush Scythes—Stevens' Patent steel spring Hay and Manure Forks—Brown's Vertical Wool Spinner, &c. &c. Boston, Jan. 25.

*The wearisomeness of what is commonly called a
Life of Pleasure.*

The spleen is seldom felt where Flora reigns;
The lowering eye, the petulance, the frown,
And sullen sadness, that o'ershadow, distant,
And mar the face of beauty, when no cause
For such immeasurable woe appears;
These Flora banishes, and gives the fair
Sweet smiles and bloom, less transient than her own.
It is the constant revolution, stale
And tasteless, of the same repeated joys,
That palls and satiates, and makes languid life
A peevish park, that bows the bearer down.
Health suffers, and the spirits ebb; the heart
Recoils from its own choice—at the full feast
Is famish'd—finds no music in the song,
No smartness in the jest, and wonders why.
Yet thousands still desire to journey on,
Though halt and weary of the path they tread.
The paralytic, who can hold her cards,
But cannot play them, borrows a friend's hand
To deal and shuffle, to divide and sort
Her mingled suits and sequences, and sits
Spectatress both and spectacle, a sad
And silent cypher, while her proxy plays.
Others are dragg'd into the crowded room
Between supporters; and, once seated, sit,
Through downright inability to rise,
Till the stout bearers lift the corpse again.
These speak a loud memento. Yet even these
Themselves love life, and cling to it; as in
That overhangs a torrent, to a twig.
They love it, and yet loath it; fear to die,
Yet scorn the purposes for which they live.
Then wherefore not renounce them? No—the dread,
The slavish dread of solitude, that breeds
Reflection and remorse, the fear of shame,
And their inveterate habits—all forbid.

Whom call we gay? That honor has been long
The boast of mere pretenders to the name.
The innocent are gay—the lark is gay,
That dries his feathers, saturate with dew,
Beneath the rosy cloud, while yet the beams
Of day-spring overshoot his humble nest.
The peasant too, a witness of his song,
Himself a songster, is as gay as he.
But save me from the gaiety of those
Whose head-achs nail them to a noon-day bed;
And save me too from theirs whose haggard eyes
Flash desperation, and betray their pangs
For property stripp'd off by cruel chance;
From gaiety that fills the bones with pain,
The mouth with blasphemy, the heart with woe.

COWPER.

From the Northern Sentinel.

MR. MILLS—Having just read a small book, which has been published by Daniel Chipman, Esq. of Middlebury, entitled "An Essay on the Law of Contracts, for the payment of Specific Articles," I cannot refrain from expressing the satisfaction I have derived from the perusal of this work. It treats on a subject which is highly interesting to the people of this State, as from the circumstances of our being rather agricultural than commercial, contracts of this description are very common, and I might even say general, among us. There is a great degree both of elegance and simplicity in the style, and the questions treated upon, are discussed with more than common ability. The book is calculated to be useful, not only to lawyers and magistrates but to every man who is extensive-

ly engaged in the ordinary dealings of the community. Such productions ought to be encouraged, and I cannot but indulge a hope that the work will meet with a ready and extensive sale, and that the author will be liberally remunerated for his exertions in spreading useful and necessary information, before the people, particularly as the price is such as to prevent scarcely any person from becoming a purchaser.

JUSTICE.

Honey a cure for the Gravel.—A number of years ago, says a correspondent, I was much afflicted with the gravel, and twice in serious danger from small stones lodging in the passage. I met with a gentleman who had been in my situation and got rid of that disorder by sweetening his tea with half honey and half sugar. I adopted this remedy and found it effectual. After being fully clear of my disease, about ten years I declined taking honey, and in about three months I had a violent fit of my old complaint. I then renewed my practice of taking honey in my tea, and am now more than three score and ten, and have not for the last twenty seven years, had the smallest symptom of the gravel. I have recommended my prescription to many of my acquaintance and have never known it fail.—*The Corrector.*

Extraordinary Circumstance.—A Cow belonging to Deacon N. Adams, which had been missing forty days, was on Wednesday last, found in a passage about three feet wide, obstructed at one end, between two barns, in the vicinity of her owner's residence. She was greatly emaciated, and although found standing was unable to walk, and she died on Thursday morning.—There is no doubt that this cow went into this place about the time she was missed, and being unable to turn herself, and not having sagacity enough to back out, the poor animal remained the whole 40 days without a morsel of food, and suffering from the effects of extreme cold, snow, rain, &c. This is an extreme case of suffering. The fact of the cow having been in the same place the whole time mentioned, is ascertained by several persons, who state they had seen her there at different times, without attending particularly to her situation.—*Salem Register.*

From the Springfield Patriot.

The Spider, which is generally considered a disgusting insect, is in fact the most ingenious mechanic, the wisest philosopher, and the most infallible prophet among the works of Providence. However much this little animal may be exceeded in other respects by intelligent beings, yet in its power of prognosticating the state of the weather, it far exceeds all other animals of which we have any knowledge. Barometers and endimeters have been constructed by men at great expense, and are among the proudest efforts of human philosophers; yet, like the heathen oracles, their predictions are ambiguous and confused;—not so the web of the Spider. It is a fact not generally known, though made public some years ago by a French philosopher, that the web of the common spider is a sure index of the state of the air for twelve or fourteen days to come. If the weather is to be fair and calm, the principal thread will be spun to a great length;—if on the contrary the weather is to be stormy and

boisterous, the thread will be short and thick, for obvious reasons; and if the spider is seen to repair the damages its slender thread may happen to sustain, you may calculate with certainty upon pleasant weather for many days. If these statements are true, (and we make them not more confidently and positively than those who have attested their truth from actual observation) we have a barometer provided by nature, more to be depended on than the most ingenious contrivance of human skill, and to which all may have easy access.

A Quandary.—A sailor, travelling in New England, fell in company with a man possessing a full share of Yankee curiosity—who after many important questions, such as where he came from, where he was travelling, &c. observing his companion had lost an arm, enquired, "Pray, may I make bold as to ask how you lost your arm?" "I'll tell you, says the other, if you want to ask me another question."—"Well I want, says he." "Then 'twas bit off," says the sailor. The honest yankee was about as bad off now as he was before. He kept silence for a few minutes, but at length, in an agony of impatient curiosity, a too mindful of his promise to ask the question direct, he burst forth with this ejaculation—"I wish I knew what bit it off."

LAW OF PATENTS FOR NEW INVENTION
CHARLES EWER, No. 51, Cornhill, Boston, has just published, "An Essay on the Law of Patents for New Inventions." By Thomas G. Fessenden, Counselor at Law. The second edition, with large additions, corrected and improved by the author.

This work is adapted as well to the use of the Attorney and Mechanic as of the Lawyer. The whole was carefully reviewed in manuscript, and recommended by gentlemen of the first legal talents in New England. The Hon. Judge Story, in a letter to the author, observed, "I have no hesitation in expressing my opinion that the book will be highly useful to all persons who are engaged in obtaining patents, or in vindicating them in Courts of Justice. The manuscript contains a collection of all the cases, on the subject of Patents within my knowledge; and the principles contained therein are detailed with accuracy and fulness in the Summary at the conclusion. I know of no work so comprehensive as yours on the subject; and it may be relied on as a safe guide."

The Hon. William Prescott, and the Hon. Dea Webster, after perusing the manuscript stated their opinion as follows: "This edition is a great improvement on the first, and we think it will be a valuable and useful book to the profession, as it contains the statutes, and states, we believe accurately, all, or nearly all the decisions, which have been made on a branch of law, daily growing more interesting and important."

George Sullivan, Esq. a gentleman who has paid much attention to this branch of law, has likewise favored the work with a recommendation, from which the following is an extract:

"Your method of arranging all the decisions in the order of an analytical digest of the several requirements and provisions of our statutes for granting patents, is the lawyer at once in possession of the judicial construction of the statutes; while your synthetic Summary, far more extended and comprehensive than in former edition, places within reach of the mechanic a sure means of judging whether his invention is the subject for a patent; what is required of him by the statute in order to obtain his patent; and what provisions are enacted for securing to himself and heirs, a meritorious privilege."

DISEASES OF CATTLE.

SELECTED AND COMPILED FROM THE BEST AUTHORS,
BY THE EDITOR.

Foul in the Foot, or Hoof Ail.

Dr. Peck, an English writer, has given the following account of this disorder and its treatment.

"Symptoms.—A hard crack first appears between the claws, or hoofs, attended with considerable inflammation; afterwards a foetid and offensive matter is discharged, similar to that of the grease in horse's heels; sometimes it appears in the form of a large tumor upon the cornet, between the hair and the hoof, attended with violent pain and inflammation.

"Treatment.—Wash the part from all dirt, and if between the claws take a rope of a proper thickness, and chafe the part afflicted,* and afterwards dress the parts with the muriate of antimony [butter of antimony] or sulphuric acid [oil of vitriol.] Let the animal stand in a dry place for an hour, repeat the application every day. If the part be much affected, rub it with some stimulating ointment, and if the tumor be likely to suppurate, linseed poultices as oft as is necessary should be applied, and repeated till the inflammation has subsided; then dress the wound with lint and mild astringent ointment. Due regard must be paid to existing symptoms. A few doses of soda sulphas [glauber's salt] will cool the body and accelerate the cure."

Edward Skellett, Professor of the Veterinary art, an English writer of reputation, says that this disorder "proceeds from two causes; the one from accidents, and the other from a morbid state of the system. Its situation is betwixt the claws of the cow, either in the fore or hind feet, but more frequently in the former. It is always attended with a swelling, the discharge from which, when it breaks or cracks, has a very offensive smell.

The *accidental foul* proceeds from gravel, flints, bones, or any other hard substance getting between the claws, which produces great pain and inflammation. The first step to be taken for its cure is to remove the hard substance, and clean the wound out; then the following ointment is to be applied to the part, spread on tow, and bound on with cloth and string.

Soft soap	1 lb.
Common turpentine	1 lb.

"Melt over a slow fire till the two articles are completely united. The dressings may be repeated two or three times, which never fails to complete a cure.

"The *joint foul* begins with great pain, attended with inflammation and swelling betwixt the claws, and even up to the fetlock joint. The claws are extended outwards from the swelling betwixt them, and the animal is very feverish. The attack of the disease is very sudden.

"In this case bleeding will be proper; after which, give a dose of Epsom salts; then apply

* This practice is condemned by other writers as cruel and unnecessary.

a plaister of soft soap betwixt the claws. It must be repeated every two days till a large core come out, which is always the case in this disease before a cure can be completed. The wound may then be dressed with the following digestive ointment, in order to heal it

Take of tar	1 lb.
Common turpentine	1 lb.

"To be put into a pipkin over a slow fire till it is completely dissolved, then take it from the fire and add to it four ounces of spirits of turpentine, which should be stirred well together till it is incorporated."

This disorder, or something very similar, has been prevalent in the United States, and particularly in the State of Maine. A communication on the subject is published in the Massachusetts Agricultural Repository, Vol. iv, No. 1, page 343. In this it is said that the immediate occasion of the Hoof Ail "is a stoppage of the issue between the claws or hoofs, which exist in all ruminating animals, and which are very much like the issues so generally known in the back part of the fore legs of pigs; the stoppage of which produces disease, and eventually death unless remedied.

"The hoof ail indiscriminately attacks thin and fat cattle, and very considerable impressions are entertained that it is contagious; therefore till the contrary is proved, it is safer so to consider it. From a very careful comparison of cases (from memory only) it appears to affect cattle who are in a feverish state, from various exciting causes; as over work; sudden changes from hard work to rest, and higher feeding. (a practice very common with farmers after working their cattle hard all winter, as a preparation for their spring's work;) being out in a storm; or being driven much, and kept long in the mud. In cows and young cattle, it seems to take either those that are brought from worse keeping to better; or the finest and best cattle in the yard. But all these observations may be erroneous; for the disease often appears suddenly, without any apparent cause; affecting individuals of the same stock tied in different parts of the barn, and in entirely different cases as to condition, exposure, &c. &c. It however, very frequently goes through a whole stock, though it does not appear to follow in regular succession, according to proximity in the stable, or in the yoke. This may arise, either from contagion or the same exciting causes, operating on the whole. In short, it is a disease very terrible in its effects at times, and which does not appear to be understood. As very few cases of perfect recovery take place in a violent attack, and, as in all cases the recovery is very tedious, we should rather *prevent* than *cure*; for which end we must carefully watch for the symptoms, and without delay apply the remedies.

"Symptoms.—When an animal is at all lame, its foot should be very carefully felt. The first indication is usually an uncommon degree of warmth, and soft and puffed feel of the parts immediately connected with the slit between the hoof, either before or behind the foot, and generally above it. If in the hind foot, and not

easily handled, a fulness may generally be perceived, by standing behind the animal and carefully comparing the appearance of the two feet, between the dew claws and the hoofs, (for it very rarely commences its attack on more than one foot.) In the fore foot it generally swells forward; and on taking up the foot, the slit between the hoofs will have the appearance of dryness, easily distinguishable to a person used to cattle; and the animal frequently licks the front part of the foot. Instances frequently occur of sudden and extreme lameness, without any appearance of heat or swelling in the foot; and these are often the worst cases; but one symptom rarely fails to accompany the disease, which is, extreme restlessness, and appearance of anguish, attended with loss of appetite and flesh; but without, in the least, affecting the brightness of the eye, and, perhaps, sometimes unnaturally increasing it; but the eye has a peculiar cast. As a general rule, it is safest to attribute all lameness of the foot, which cannot be traced to a sufficient cause, to the hoof ail. Lameness of the foot can generally be distinguished from that of the leg, hip, or shoulder, by making the animal step over a stick or rail, and carefully watching its motions.

"Remedies.—The foot should be carefully washed and cleansed, and thoroughly examined, to be sure that the lameness does not arise from a nail casually run into the foot, or a pinch in shoeing, or from a wound from a stump or other substance between the hoofs. (a case frequently occurring.) If no appearance occurs of any break in the skin, while the foot is still wet, apply, as nearly as may be, to the centre of the slit, between the hoofs, from one to three grains of corrosive sublimate (reduced to a fine powder) the dose to be proportioned to the size of the animal, and the violence of the attack.—Care must be used that the powder is put completely into this slit, for it is a very strong poison, and the animal, as soon as at liberty, will begin to lick the foot, if a sore one.* The moisture left by the washing, makes the powder adhere; and the effect is produced in a very short time. Some prefer mixing the powder with hog's lard, which answers; but is thought less powerful: it has one advantage, however, as being less dangerous to keep in a house (for no one takes salt inwardly.) Where corrosive sublimate cannot be obtained, any other violent stimulant may be applied. Common salt is often effectual in very slight attacks, but it is of the greatest importance to lose no time. The application is to be repeated once every twenty-four hours, till a cure is effected, or till the foot shows unequivocal signs of a gathering which will break. It is supposed that the corrosive sublimate, by stimulating the parts, removes the obstruction, and enables nature to resume the natural discharge from the issue, of a matter, which (as soon as pent up in the foot) causes inflammation and suppuration, and at last, forms an abscess, at all times very difficult to heal, and which, when large, takes

* Might not a rag or bit of leather be so fastened with a string as to prevent any danger of this sort?

of one or both hoofs, which are never properly replaced. It must, therefore, be considered as an object of the first importance to restore the secretion and discharge, without allowing a supuration. This done, the cure is effected; and, since the course has been followed, no bad case has occurred in a very considerable stock of cattle, and the men attending them are quite familiar with the cure. If, from want of attention, or the violence of the attack, the gathering is formed, and breaks, it must be treated like any other tedious ulcer, and without any violent or harsh measures. The animal should be kept quiet, fed well, and occasionally purged. As soon as the discharge has ceased, a salve of flower of zinc, and hog's lard appears to be the best dressing.

"It cannot be too strongly impressed on the minds of those who have the care of cattle that not a moment is to be lost; and that the corrosive sublimate produces no other inconvenience than pain for a few minutes, even if it should be applied in a case of lameness, which afterwards proves to have arisen from other causes.

"An account appeared last season, of the cure being effected by cutting off the point of the hoof with a chissel, till it bled considerably. Of the efficacy of this remedy, no opinion is given, as it has never been tried here; but the impression is not favorable, as it must occasion temporary lameness, and, in unskilful hands, prove something more than temporary.

"All such barbarous modes of treatment as hair ropes drawn backwards and forwards between the hoofs; hot irons; cutting out the part affected, and pouring into the wound, so made, hot pitch and other ingredients; scraping out the wound, and applying spirits of turpentine; in short all remedies of torture, should be at once discarded, and a simple mode of ascertaining the cause, and then removing the evil in the most expeditious and humane manner be substituted.

"No inconvenience is known to occur from keeping an ox at work, if the lameness is not so great as to impair his condition; and it generally yields to three or four applications in the foot where it began; but frequently it must be followed round all the feet in succession."

We have been the more particular in our description of this disorder, and the remedies recommended, on account of its alleged frequency in the United States. If the simple and cheap remedies recommended by Dr. Skellett, viz. soft soap, common turpentine, tar, and spirits of turpentine will answer the purpose, attributed to them by that writer, the discovery will be highly valuable.

From Sinclair's Code of Agriculture.

On the making of Watering Ponds.

Various modes of making ponds have been adopted, with a view of simplifying the process, and lessening the expense; but the improved practice, which, if followed, will be found to answer in almost any situation, in any country, is as follows:

Let a circle be marked on the ground sixty feet in diameter, more or less, as the person chooses, or the size of the pasture may require a supply of water, and if of that diameter, let it be hollowed out into the shape of a bason or bowl, to the depth of seven feet in the centre; when the surface of this hollow has been raked

smooth, let it be well beaten over, so as to reduce it into as even, uniform, and firm a surface as the nature of the ground will admit of: on this, well fallen, screened lime, must be uniformly spread, with a riddle, to the thickness of two or three inches; the more porous or open the ground, the greater will be the quantity of lime required; this lime must then be slightly watered, to make it adhere firmly to its place, and great care must be taken, to spread it equally, so that no place may remain uncovered, as on the lime, depends more than any thing else, the success of the work. On this lime must be laid a bed of clay, to the thickness of about six inches, which being moistened sufficiently to render it ductile, is to be beaten with mallets or beetles into a compact solid body, capable of being trod upon without impression or injury. Great care is to be taken in laying on uniformly this mass of clay, and beating it into a compact body; for which purpose, no more must be spread at a time upon the lime, than can undergo the beating, while it retains a proper temper or consistence for the purpose: after the whole is thus finished, it is gone over several times by the beaters, and sprinkled each time with water, and care is taken, to prevent any cracks being formed, which might entirely destroy the power of retention.

Pure brick-clay is not required, but any tenacious earth, that by beating will become a solid compact body, will answer the purpose. As soon as this operation has been duly performed, the whole surface of the clay is covered, to about the thickness of a foot, with broken chalk, fine gravel, or the chippings of mouldering stone, or limestone, to prevent any injury being done by the treading of the cattle. It is necessary to observe, that coarse stones must not be made use of, as they are liable to be displaced by the treading of cattle. They are also liable to be pressed into, or through the bed of clay, or to be rolled down to the bottom of the pond; under all which circumstances, the beds of clay and lime are liable to be broken, and the water consequently let out of the pond. Sometimes the clay is covered with sods, the grass side being laid downwards, as a support to the gravel, by which some saving of covering may be made; or several inches thick of common earth is laid upon them, or upon the clay without the sods, by way of bed for the covering, where gravel, or such like materials, may be scarce, by which, something may be also saved.

After the clay has been well beaten, some workmen water the surface of it, and fold sheep or pigs, for a considerable time upon it; the treading of which, is found to be serviceable in rendering it more compact.

Some people, instead of using slaked lime, have good mortar, made of lime and sand, well worked together, and cover the surface of the ground with it, to the thickness of about an inch; this, if carefully done, is thought to be the most effectual mode of rendering the bottom retentive; but the mortar is liable to crack before the clay gets bedded over it, which must be carefully guarded against. Ponds have been made, where a coat of mortar has also been spread over the surface of the clay, as well as under it, an approach perhaps as near as possible to perfection; but where lime bears an high price, the expense is thus considerably augmented.

The best season for making these ponds, is thought to be in autumn, as they are then likely to be filled the soonest, and the least liable to crack before they are filled. Should the weather prove dry at the time they are finished, it is well to cover their surface with straw or litter, to hinder them from cracking.

These ponds are usually made at the foot of some declivity, where, after heavy rains, a slight run of water may be conveyed into them, from some road, or other firm surface; but many are placed without any such assistance for filling, or with very little, it being found, that the rain that falls upon their surface is, in general, sufficient for a supply, after they have been once filled. As it is desirable to get them filled as soon as possible after they are finished, snow is frequently collected and heaped upon them, if possible in large quantities, the first winter after they are finished for that purpose.

Ponds of this kind, are usually made by what may be called professional people; men who go about for the purpose, and are chiefly or entirely engaged in it, and usually contract for the job. One of the diameter of sixty feet, and depth of six feet, may in most situations be executed for about 15*l*.; one of forty-five feet by five feet for 10*l*. or 12*l*.; but some allowance must be made for the different prices of lime, or the distance it may be necessary to convey it, as well as the clay, or the other materials for the work. A pond of sixty feet diameter, by six feet deep, will contain upwards of 700 hog-heads of water; one of forty-five feet by five feet, near 400 hog-heads—a vast supply, when obtained at so small an expense.

Experience now of many years, and the universal use of ponds in this district, wherever wanted, have proved them, when carefully made, so effectually to retain water,—to preserve it of so good a quality, when not fouled by the treading of cattle,—and to be applicable to many situations, that they cannot be too strongly recommended in all high situations, where water may be much wanted, or in all other situations where the water may be of bad quality: they are equally applicable to our dry wolds, downs and heaths, which are without water, as to every fenny tract which has too much of it, but of a brackish or unwholesome quality.

From Airin's Athenaeum.

Account of a Successful Experiment in making Soap, by the operation of Steam, instead of an open fire; communicated by Count Rumford to the French National Institute.

The steam was conveyed into the vessel, which contained the lie and other materials for the soap, by a pipe arising from a close boiler, and again descending into the vessel; the action of the steam in condensing in the cold lie, occasioned a succession of smart shocks, similar to blows of a hammer, which caused the whole apparatus to tremble, but which gradually subsided as the liquid became warm. Count Rumford supposes, that the beneficial action of the steam depends for the most part on the motion described, caused by it, and therefore proposes dividing the vessel into two parts by a horizontal partition of thin copper, and causing a slow current of cold water to pass through the lower division, and to let the steam into this lower part, when the upper became too hot to admit of a continuation of the strokes from the con-

ensation of the stream; by which means the same motion being continued in the cold water, could be communicated to the hot liquid through this partition.

The soap made by the operation of the steam, required only six hours boiling, whereas sixty hours and more are necessary in the ordinary method of making soap.

From the Providence Journal.

In reading Simond's Switzerland, I came across the following notice of a cotton mill which I saw at St. Gall, and which I have transcribed in your useful paper—it seems almost incredible that one ox should move so great a quantity of machinery; but whether true or not, it may suggest new ideas of the application of mechanic powers.

B.
“We were taken to the most considerable cotton mill of the place, set in motion, not by water, or steam; but the labor of an ox, acting as part of a turn-spit:—the poor animal, shut up in a wheel thirty feet in diameter, walks on its self-defence, as the wheel being once in motion, he must go with it, which he does very deliberately, resting his feet on brackets, or pieces of boards nailed across the revolving floor. There are three oxen working by turns, each two hours; they last at this rate, two or three years; the power is sufficient to move twenty nine mules of two hundred and sixteen pounds each (there were only twenty going when I saw it) with carding and cleaning machines in proportion.”

From the American Farmer.

TO MAKE CIDER OIL.

This liquor is a very favorite drink with a large portion of our German citizens, and of an agreeable flavor, when diluted, to most persons. The following receipt has been communicated to the Editor, by a person well acquainted with the mode of compounding the liquor.

The cider must be well racked two or three times in clear weather. Four gallons of best apple-brandy are then to be added to each barrel of cider, if the cider be weak, but if it be strong, less will suffice. An infusion of Sassafras root, made by putting a piece of about the size of a finger, and chipped fine into a pint of water, improves the flavor. The barrel is then to be rolled.

In years when apples are abundant, cider even of a good quality brings only a small price; it by converting it into cider oil, it may be reserved until the following spring, and will then commonly sell well.

TO DRY PEACHES.

The following mode of drying peaches is adopted by Thomas Belankee, of Egg Harbor, New-Jersey:

He has a small house with a stove in it, and drawers in the sides of the house, lathed at their bottoms. Each drawer will hold nearly half a bushel of peaches, which should be ripe, and not peeled, but cut in two and laid on the shelves with their skins downwards so as to save the juice. On shoving the drawer in they are soon dried by the hot air of the stove and laid up. Peaches thus dried eat like raisins. With a paring machine, which may be had for a dollar or two, apples or pears may be pared, and a sufficient quantity dried to keep a family in pies,

and apple bread and milk, till apples come again. With a paring machine,* one person can pare for five or six cutters.

* An ingenious friend of ours, in Boston, promised to make us one of these machines, but we fear he has forgotten it.—Ed. Am. Farmer.

TO PRESERVE BACON SOUND AND SWEET THROUGH THE SUMMER.

Dear Sir—In the Farmer, volume 3, p. 134, you published a communication from Mr. J. W. Lincoln, of Worcester, recommending that hams, after being smoked should be packed away in oats. I followed his advice last year, and really feel so much indebted to him for the hint, that I must thus publicly thank him; and for the benefit of my neighbors ask you to republish his letter. To give you the best proof of the beautiful state of preservation secured by this method, I send you a ham weighing 113 pounds; you will find it perfectly fresh, and full of essence—free from all sort of speck or blemish. Those practising this mode of preserving their bacon free from skippers or taint of any kind, should recollect, that the chest or cask ought to be perfectly tight, and raised about six inches from the ground, and the oats packed in quite tight. A ham of this size should be boiled $3\frac{1}{2}$ hours at least.

☞ We can seldom undertake to speak from experience about recipes, but in this case we can vouch for its accuracy, from reliance both on the word and judgment of both the writers. But it must not be expected that the oats will convert bad bacon into good; all that is promised is that this will preserve it *in statu quo*.—Ed. Am. Farmer.

From the New York Statesman.

NORTHERN COTTON.

Messrs. Editors—I planted some of your cotton seed last summer, and distributed it among my neighbors, who did the same. The result has demonstrated the fact, so much doubted twelve months ago, that cotton can be raised in Connecticut, New York, and New Jersey, (and I believe in Canada,) of as good quality as is produced in any part of the world. From the shortness of our summers, compared with the season in tropical climates, however, I presume the quantity which could be grown in this latitude, would be inferior to the crops in the southern States, and that it can never, therefore, be an object of profitable cultivation with us. It appears that frost, which stops the progress of vegetation, and puts an end to the further growth of the plant, does not prevent the bolls or pods already formed, from ripening to perfection. Of a sample that I planted, the arrival of frost, ice and snow, found the bolls of every size, from the smallest complete formation to their full growth; and since that time, during the inclemency of the winter, their contents, or pulp, have matured into perfect fibre, and exhibit the most beautiful cotton, of shorter staple, but probably of finer and softer texture, than the Sea Island itself, the smallest bolls appearing to furnish the finest staple, though of diminished quantity. Like Mr. Dunham's, covered with ice and snow, they have matured with equal certainty as the same species at midsummer. Thus the probability of its growth in our northern latitudes is perfectly establish-

ed. Indeed I have heard of its cultivation in Connecticut, as a matter of curiosity, twenty years ago. From the information which has been given on this subject, it is probable that a number of gentlemen in this vicinity will plant a quantity of seed early in the ensuing season, so as to try the experiment fully and fairly on a large scale, as to the practicability of its culture, and the ultimate profit of raising the article instead of importing it. I send you a number of bolls, taken from plants in this city, in February, two days ago, for the examination of connoisseurs in cotton. And I have no doubt, that before this day twelvemonth, the public will be in possession of complete and satisfactory information on the subject—a subject which has lately excited much interest in this country, but more, I understand, in France, where it is considered a desideratum to prevent the importation of the great quantities of that article required for the manufactories in that kingdom.

C. H.

Moths.—To prevent moths from attacking woollen clothes, or worms from destroying books, place in the drawers or corners of the shelves some of the roots or blade of the Sweet Flag. A decoction of the same will prevent their attacking buffalo skins, by sprinkling it over them. This is not only effectual for the above mentioned purposes, but is a pleasant aromatic.

Panada.—Boil for not more than two minutes some slices or crumbs of bread, with a blade of mace in a quart of water; then take out the bread, and finely bruising it in a basin, mix as much water as will make it a proper consistency. Put in a bit of fresh butter, grate a little nutmeg, and sweeten it to the palate. If wine be required, though it is much best without, by no means boil it with the water and bread.—This is a delicate diet for a weak stomach.

The Portland Statesman gives the following description of a Threshing and Winnowing Machine, invented by Mr. Josiah Jaquith, of Brunswick, Me. “By this instrument, the process of threshing, sifting and winnowing grain of any kind, is performed at one operation. The work commences by laying the grain in stalk, on the feed table. This table is supposed, in common machines, to be four feet long, but, for the purpose of preventing an interruption of labor when only one person is employed, may be extended to any designed length. The grain thus placed, is carried under the flails, which are so equably and exactly applied that it is almost impossible for any part of the grain to escape unthreshed. When the grain is threshed, it passes into a sieve which separates it from fragments of stalk, &c. From the sieve it falls in front of a fan, set in motion by the same power, and is winnowed. By lessening the feed, and substituting a tight floor instead of an open one, the machine will answer for cleaning clover and other seeds.”

Weeds are deadly foes to the farmer, but in the compost heap they become friends. They should be carefully eradicated and deposited in the compost heap before their seeds have matured lest they should be propagated by scattering the manure before the seeds have become completely rotten.

From the Mass. Agricultural Repository for January.

On raising, feeding and fattening Cattle, also on the utility and comparative value of the cobs of Indian Corn when used with, or without the grain itself ground or broken.

To the Trustees of the Mass. Agricultural Society.

GENTLEMEN,

In the first place I select my earliest and best calves to raise, I let them suck the cow twelve weeks, which is my general rule, eight weeks twice a day and in sufficient quantity to keep them in a growing state, but am careful not to let them get fat. Four weeks longer, once a day, the two last however are allowed to take but about half the quantity of the two first; I keep a supply of good hay at their command all the while, as they will begin to eat when only a few days old, and then turn them out into good feed, without giving them any grain or meal. If I am raising a Bull, Cow or Ox, I would avoid giving them meal or grain; especially the first or second years, as I would a pestilence. I begin with a creature so as rise upon the keeping.* In one instance, however, I have followed opposite plan, which tends to confirm me more in my belief. In April 1820, I had an uncommon heifer calf, which I set down for a premium calf; I knew very well what I had got to do to obtain it, viz. to let it take what milk it would through the season and learn it to eat meal, which I did and presented it at the Worcester Fair, and obtained the first premium. I then tried to sell the calf, but could not; I considered it fit for nothing but the butcher's knife, and in fact not fit for that, it was neither veal nor beef. I then took it from the cow and put it to better than my usual keeping, but it lost its flesh and has appeared rather ordinary ever since, it appears to be crowded out of its natural shape. If I had reared the calf in my usual way I should have expected something extra from her, but I now do not. To return to my mode of increasing their keeping, I give them a little better hay the first winter than the second. I make it my care and attention that my cattle do not lose in the winter what they gained in the summer, which is too apt to be the case with some. I feed them as the weather varies, that is, in moderate weather they will not require so much, I endeavour to keep my barn tight and warm. I have witnessed with regret, farmers too often let their stocks of cattle remain out all day, through tempestuous stormy days in the winter, until they are chilled through, which must be very injurious, I take care that my cattle are sheltered from stormy days as much as possible. Fattening cattle is an employment which I like. I invariably aim to fat a creature as quick as I can. Every year since I commenced business for myself, which is fifteen, I have made one yoke of oxen good so as to command generally the highest market price; with almost all those which I have fattened, I go through with all my spring work then turn them to pasture; in the fall I lay a foundation for giving them meal with green stalks small ears of corn and vegetables of some kind, I begin to give meal about the first of December and drive them to market the latter part of January, they generally weigh from 25 to 28 hundred the

yoke, and from 300 to 330 pound of tallow. I would refer to Mr. Abijah White of Watertown, and Messrs. Davis, Miles and Pierce of Brighton who have generally purchased my beef. I give my cattle what meal they will bear; after I begin, they are allowed an average of three pecks per day for each yoke; by thus doing they will eat but little hay, I turn them out into the yard to lie during the night having a shed to go under at their pleasure which I consider far better than to remain in the barn. The kind of meal I have used for seven years past, almost exclusively for provender, is corn and cobs cracked and ground together, which is the best provender I have ever made use of for fattening cattle.* The reason I consider the cob useful, is, it swells in the creature and keeps him in good order; in no one instance since I have fed with this meal have my cattle been out of order by being cloyed or scouring, they are at all times regular, but when I formerly fed with clear Indian or oats and Indian, it was not unfrequent, that their bowels would get out of order, and I have had considerable difficulty in regulating them again, they lose two or three days, sometimes a week. When this kind of provender was first introduced in this vicinity it had its opposition like almost all new things, the second year, if I mistake not, which I made use of it, I thought I would try an experiment, as follows, by feeding one ox with corn and oats ground, the other with corn and cobs, having a yoke of oxen so even matched that no one who viewed the cattle appeared satisfied which was the best, accordingly I fed them as above. The cob is computed to make a little more than a third, therefore I mixed the other with one third oats which was my former mode, I gave each ox an equal quantity at a time except that the one that had the corn and oats, some days became dainty, and would not eat his allowance, while the other kept a regular course, the allowance for both was little rising three pecks per day. When I took the cattle to market Mr. A. White bought them, they weighed about 26 hundred and a half, the one fed on corn and oats had 162 pounds of tallow, and weighed about half a hundred more; the one fed on corn and cobs had 163 pounds of tallow and Mr. White pronounced his beef half a dollar on the hundred better than that of the other mostly on account of the color of the beef.

In another instance I took a yoke of oxen, which had done all my work through the season up to the first of November 1818, on my farm which contains over one hundred acres. They were a good sort of cattle, about middling size, and no more than in good working order. I then put them to fattening upon the cob and corn meal; they were fed with nothing but hay, and the corn meal, I turned them in the month of February 1819. Mr. White purchased them, their weight was about twenty-four and a half hundred and had almost three hundred pounds of tallow. I have however fattened two creatures a little differently from what I have above described, one was a steer four years old the 10th of February 1821, the first of March following I began to give him this cob and corn meal. He had not, previous

to this, ever been fed with any kind of meal grain or roots, of any kind whatever. I gave him from four to six quarts a day of this meal and nothing else but good feed until the 27th of September, which day I drove him to the Cattle Show at Worcester, and they awarded me the first premium on beef, I then drove him to the Brighton Fair the same year and they awarded me one of the premiums there on beef. I sold him, his weight was 1509 pounds, had one hundred and fifty-four pounds of tallow. I have another steer four years old the 12th of April last, which I have treated in the same way the past season, I drove him to Worcester the 25th of September of this year, and the trustees awarded me the second premium on beef. It has been remarked by some well informed Agriculturalists in this vicinity, that it is not on record at any other Cattle Show in this state, that the highest premium for beef has been carried by four year old steers, since the Worcester Agricultural Society was formed. There have been four anniversaries, in which have taken the premiums for the best fattened ox for the second best do. for the best milch cow for the best two year old steer, for the best heifer from one to three years old, and for the best heifer calf, all of my own raising, and wholly of the native breed except the heifer calf which is a cross with DEXTON. I have now three creatures preparing for the Brighton market, which I contemplate driving the first of January, viz. the above mentioned steer will weigh between fifteen and sixteen hundred slaughtered, as he weighed two thousand alive in September last, and a cow that will probably weigh between eleven and twelve hundred slaughtered, and a three year old heifer nearly nine hundred, all of my own raising and fattening. Many of my friends are endeavoring to persuade me to keep the above steers another season for the Brighton Fair, at present I am undetermined. Before I close I would make a few remarks on corn and cobs. My aged father who still survives, upwards of eighty years of age, who has formerly raised considerable excellent beef from this farm to the Boston market, since he has witnessed the saving of labor, and seen the effects in fattening cattle, and hogs, has often been heard to say if he had known this thing when he first commenced business in the world, it would have saved him two or three hundred dollars. For my hogs, I mix oats with it, and it answers good purpose, it gets them along as fast as any provender I ever made use of, I see no material difference. It makes excellent fodder for a horse and is coming very much in fashion for that use. My faith is so great in the thing I would carry my corn six miles to mill to be ground in this manner even if I could get it ground in the common way within half a mile I submit these remarks for your disposal and consideration. ASA RICE, JR.

Shrewsbury, 20th November, 1822.

* We conjecture Mr. Rice means the one which obtained the premium at Worcester.

On Raising Corn.

To the Trustees of the Mass. Agricultural Society.
GENTLEMEN,

There is a high barren hill on my farm, which has been improved for a pasture ever since the

* We presume this means, so as to increase the quantity and quality of the feed. Ed.

* We are by no means satisfied with the reasons assigned by Mr. Rice. The facts are what most concern us. Editor

first settlement of the town, it had the appearance of making very good ploughing land, but in consequence of the steepness of the hill on every side, which rendered transportation so difficult, and supposing it bad husbandry to try to raise Indian corn without plenty of manure, one generation after another has passed off and suffered the hill to remain dormant. The present occupant being of the fourth generation of the same family in possession of the farm, hit upon an experiment of raising Indian corn with the aid of Plaster of Paris alone. I went on to the hill with my team in the month of September 1820, and ploughed as I supposed about two acres, and found it an excellent soil, a deep and good colored loam, free from stone, left it in that situation until the following spring, at which time I first gave it a harrowing, then cross ploughed and harrowed it again which left it in a fine state for planting. My neighbors began enquiring what I was about to do on the hill; I told them my plan; they said it was impossible, such a thing could not be done to advantage, that I should lose all my labor, but I was resolved to persevere in the experiment. I accordingly furrowed it in my usual way about a common pace asunder, dropped the seed, threw a common table spoonful of plaster into the hill, then covered it with earth which was all the manuring it had, except a slight quantity of ashes at the first time of hoeing. It pushed forward with greater rapidity through the season than my other corn where I manured very high, and at harvest time it appeared superior to any corn I had. Several of my neighbors kindly offered to assist me in harvesting and measuring the corn to know the result, we found by exact measurement there were ninety and a half bushels of shelled corn of an excellent quality, and by actual survey, we found there was one acre three quarters and twenty-seven rods of land, making almost forty-eight bushels to the acre; it was supposed to be the greatest quantity to the acre raised in the town, the last season, (it will be recollected the season for corn was not so good as the present.) The quantity of plaster it took, was about four hundred weight. The whole labor bestowed on the field exclusive of the harvesting was performed by one man and two small boys in fourteen days and one half. I presented this statement to the Worcester Agricultural Society, at their December meeting, and they awarded me a handsome premium and highly complimented me for my novel experiment. It was generally supposed that the strength of the land was exhausted, that it would not produce any thing farther unless it be very highly manured, which caused me to extend the experiment. I accordingly planted the same piece the present season, in the same manner, except adding a little more plaster, say a quarter more to the hill.

The same gentlemen who assisted me the last season in measuring the corn assisted me again, and we found by a careful and exact measurement there were one hundred and two bushels lacking two quarts, making over fifty-three bushels per acre. There are perhaps eight or ten acres on the top of the hill adjoining that I ploughed, which is so level, that it is very convenient working on it, which induces me the next season to sow this piece with oats and grass seed, with a good coat of plaster, and

plough up another piece and manage it in the same way.

I now present the doings of both seasons to the Massachusetts Agricultural Society for their consideration.

ASA RICE, Jr.
HENRY HOWE.

Shrewsbury, Nov. 12, 1822.

NOTE. We have taken the needful liberty of curtailing Mr. Rice's letter. We hope without offence, and we are sure we have not lessened its perspicuity or usefulness. Editor.

FOR THE NEW ENGLAND FARMER.

From a general view of the evidence and arguments presented to the public by the Hon. Mr. Pickering, on the best time for "felling trees for timber," he appears to have established the important fact, beyond a reasonable doubt, that white oak timber, felled, or stripped in barking time, will be stronger, more compact, and nearly twice as durable as timber felled in the winter season. The experiments of Mr. Poor, also, go far in confirming what Mr. Pickering had proved.

Can there be a doubt but the same means which produced this extraordinary strength, compactness, and consequent durability in oak, would be productive of similar effects in pine, and every other sort of timber? We can hardly imagine a discovery of more importance to every section of our country, than the certainty that by merely felling their timber at a particular season of the year, their bridges, fences and buildings of every kind, would last nearly double the usual time.

On a moderate calculation, it would cost the inhabitants of Massachusetts more than six millions of dollars to renew all the shingles on the roofs of their buildings. The shingles in use are chiefly made of white pine, felled in the winter, and are estimated on an average, to last about twenty-five years. Hence the expense of the annual wear and waste is no less than \$250,000. If shingles made from white pine stripped of its bark in June, would become so compact, and unpassable to the wet, as to last many years longer, the saving to the inhabitants of Massachusetts alone, must be no less than \$250,000 for every year beyond the time they usually last.

If any gentlemen conveniently situated, will take on themselves the trouble of making a fair experiment of the durability of pine shingles made from trees stripped of their bark in June, compared with common shingles made from trees felled in the winter, and publish the result, they will certainly merit the gratitude of their country.

The highly respectable Mr. Cooper, late of New Jersey, is said to have "pronounced with great confidence, that oak and hickory trees felled when their sap was vigorously flowing, would not be attacked by worms, producing what is called powder post." The cause of this exemption from the depredation of worms, is probably the same as that of its extra-durability.

Sir Humphrey Davy tells us in his "Elements of Agricultural Chemistry," that "Mr. Knight examined the albumen in different poles of oak in the same forest: of which some had been felled in winter, and others in summer; and he always found most soluble matter in the wood, felled in the winter, and its specific

gravity was likewise greater."* This being the case with the albumen, or sappy part of the wood, there can be no doubt of a somewhat similar difference in the heart part of the wood.—The foregoing premises being admitted, we may conclude that timber felled in winter while replete with inspissated sap, after being thoroughly seasoned, will, of consequence be found easier to work, because more porous, or spongy than that felled in summer, while the sap is both scanty and limpid; but the wood of the latter soon becomes more hard, strong, and compact, and consequently more durable; and will never be bored by worms, because it contains no nourishment for them. In timber felled in the winter, after being thoroughly seasoned, the essence or saccharine matter of the sap, still remains in it, a nutritious and palatable food for various kinds of worms, both on land and under water; and these worms evidently gain their living as they progress, from the wood they reduce to powder. The vessels of the winter-felled timber, so replete with sap when felled, are believed to continue open, and, like a sponge remain susceptible of imbibing water whenever exposed, which inevitably produces fermentation and gradual decay.

Speaking of timber stripped of its bark in June, Sir H. Davy says:—"The reason of the superiority of this timber is, that the concrete sap is expended in the spring in the sprouting of the leaf; and the circulation being destroyed, it is not formed anew; and the wood having its pores free from saccharine matter, is less liable to undergo fermentation from the action of the moisture and air." From a view of the testimony and argument adduced, in connection with the mass of evidence before the public, we may fairly conclude that the true cause of the extraordinary durability of timber stripped, or felled in barking time is this, that when seasoned it becomes so compact as to be impervious to the wet; and also, that it remains secure from the depredation of worms, because it contains no saccharine matter for them to subsist upon.

J. KENRICK.

* The subscriber is taking effectual measures for ascertaining the exact difference between the specific gravity of various kinds of green timber, in the month of February, and the latter end of June. The result will probably be published.

Ants.—The Rev. Wm. Williamson, of Westmore, near Canterbury, in England, communicated an expeditious method of destroying Ants, which may be easily adopted where those insects become troublesome, or are injurious to plants. He stops the holes at the bottom of small pots, and places them inverted on the spot frequented by these insects, which soon take possession of the interior of the pots, and may then be easily destroyed therein, by hot water. The ground whereon the pots are placed, should be kept rather moist. There are two sorts of ants which are found in forcing frames, the red and the black; the former are easily got rid of by introducing the large black ant of the woods, which will leave the frames when the red ants are destroyed, but they are not able to overcome the latter: for the removal of these, the above remedy has been efficacious.

To turn Wine into Vinegar in one hour.—Make a thin round cake of the best rye flour and the

strongest vinegar. Bake it quite dry in the oven; then pound it into a fine powder, with which and vinegar make another cake, and bake it as formerly. Reiterate this operation three or four times; then hang the last made cake quite hot in a cask of wine, and it will turn the whole into vinegar in less than an hour.

Texus Wood, or yew tree, thrown into wine, will soon change it to vinegar. Red Beet has the same tendency.

To increase the strength of Vinegar.—Boil two quarts of good vinegar till it evaporates to one. Put it in a vessel, and set it in the sun for a week; then to one part add six of weak or indifferent vinegar, and it will make it strong and agreeable.

To revive old writings.—Boil gall nuts in wine, then with a sponge dipt in the liquor, pass it on the lines of the old writings, when it will appear as fresh as if newly done.

To prevent wine tasting of the cask.—Stick a lemon full of cloves, and hang it at the bung hole, over the wine for three or four days, during which the air must be prevented from getting into the cask.

To clarify new wine.—Hang a bag full of fine and thin beech shavings at the bung-hole for two or three days. If the wine is red, it may be made white by adding a quart of clear whey to the cask.

To restore turned wine.—Half a pound rock alum in powder; the same quantity of sugar of roses; 3 pounds of honey, and 1 quart of good wine, mixed well together, and then put into a cask of wine, stirring while it is poured in. Leave the bung out for one day; then replace it, and two or three days after the wine will be clear.

A handful of parsley put into a bag, and hung for a week in the bung-hole of a cask of wine, will correct any bad flavor it may have.

A bag of leek seed, or of the leaves and twist-ers of the vine, put into a cask of wine to infuse, will restore it if it is sour or sharp.

A handful of steel filings, and another of salt, tied up in a bag, and placed on the bung, will prevent wine from being hurt by thunder.

Employment of Iodine for the Relief of Cancer.—We have heard that Iodine, in the form of Alcoholic solution, duly diluted with simple syrup, has been used with success in one of the Paris Hospitals, allaying the pain and increase of a cancerous tumor in the breast; but we have been unable to obtain from our correspondent any satisfactory particulars of the case; we, therefore, merely throw out the rumor for the consideration of our medico-chirurgical readers.—*Journal of the Royal Institution, No. 27.*

Railor Silenced.—A woman stopped a divine in the streets of the metropolis, with this salutation: "There is no truth in the land sir! there is no truth in the land." "Then do you not speak truth, good woman," replied the clergyman. "O yes, I do," returned she hastily. "Then there is truth in the land," rejoined he as quickly.

THE FARMER.

BOSTON:—SATURDAY, FEB. 15, 1823.

THE AMERICAN ORCHARDIST.

We have perused with much pleasure, and we hope not without profit, a work entitled "*The American Orchardist, or a Practical Treatise on the Culture and Management of Apple and other Fruit Trees, with Observations on the Diseases to which they are liable, and their Remedies. To which is added the most approved Method of Managing and Preserving Cider. Compiled from the latest and most approved Authorities, and adapted to the use of American Farmers.*" By JAMES THACHER, M. D. Fellow of the American Academy of Arts and Sciences, and of the Massachusetts Medical Society, &c. &c. Boston: published by Joseph W. Ingraham; pp. 236, 3 vo. price \$1.25. [The work may be purchased at any of the principal Bookstores in Boston.]

This work has been recommended by the Officers of the Massachusetts Agricultural Society, who have unanimously affixed their signatures, as individuals, to the following testimony of their approbation.

"We have perused, at the request of Dr. Thacher, his Treatise on the Culture of Fruit Trees, and the Art of Making Cider; and although we cannot hope that our opinions will have any great weight with the public, yet as the author is desirous that we should express them, we have no hesitation in saying, that it appears to us an excellent compendium of all that has been written on the subject—comprising, within a moderate compass, the result of the observations of the experienced cultivators of Europe, and of this country—with many original suggestions of his own—and we believe that such a work will be of great value to those who wish to obtain a knowledge of this branch of agriculture, but who cannot have access to the original sources, from which, with great labor, and, as we believe, good judgment, this compilation has been formed."

We have copied this recommendation, at length, because it has that weight which attaches to the opinions of gentlemen, who are eminent for practical, as well as scientific knowledge of agriculture and horticulture; and because the merits of the work could in no other words be more concisely, and at the same time more fully expressed. We believe that any person who has even no more than half a dozen fruit trees to cultivate, would save money by buying this book and making himself acquainted with its contents; and every house-keeper who would wish to make the most of one of the cheapest, as well as one of the best gifts of Providence to mankind, would find his or her account in becoming possessed of this compendium of valuable information relative to fruit and fruit trees. A knowledge of the medical properties of apples alone [see Orchardist p. 12] is worth to house-keepers five times the price of this book. As an article of diet, when properly chosen and judiciously cooked, they yield perhaps to no vegetable substance, except the potatoe. Sweet apples, in particular, are a wholesome, cheap and very palatable food for man and beast. The liberal use of fruit counteracts that debilitating, degrading and demoralizing hankering after spirituous liquors, which foreigners, (we fear with some truth,) have declared to be a national characteristic of the American people. But we must refer to Mr. Thacher's book for the various uses of fruit (some of which, we dare say, many good people have never thought of) as an article of commerce, as well as domestic consumption.

We believe that nothing can prevent the general circulation of Dr. Thacher's American Orchardist, except that kind of economy (falsely so called) which by "withholding more than is most tendeth to poverty;"

or a prejudice, which we fear is too general, against every kind of information which comes in the shape of a book, or appears in print. But what is this book knowledge, which some farmers seem to think worse than profound ignorance? In agriculture, it consists of facts and observations, derived from experience and reason, and recorded first in writing, and then printed. Nobody objects to acquiring the rules of arithmetic, geometry, surveying, and the precepts of morality and religion, from books. And why may not the rules of agriculture, gardening, and those in particular which have reference to the management of fruit trees, be set down in black and white, and sent to the press? If a farmer knows, better than the book can tell him, how to manage with regard to any particular point or matter set forth in the book, let him make use of his own knowledge, in preference to that in the book. The book only advises, it does not dictate. It furnishes, at a cheap rate, materials for the farmer's own mind to work upon. Pope says,

"What can we reason but from what we know."

And what can we know if we know nothing excepting what we have done ourselves, seen other's do, or heard our neighbors talk of, in comparison to what we may know by having the experience of ages presented to our view in a book? Besides, if a farmer knows better than a book teaches, if he is a genuine patriot and well wisher to mankind, he will in some way communicate his knowledge to the author, or some editor of a newspaper, in order to have the mistakes in the book corrected against another edition. In short, there can be nothing said against book knowledge in agriculture, which may not as well be said against books relating to law, physic, or even divinity, which are (at least now-a-days) all written by fallible men.

But it is time to conclude our dissertation on book knowledge, and this notice, with a quotation from the work before us.

"It is a remarkable fact that the first planters bequeathed to their posterity a greater number of orchards, in proportion to their population, than are now to be found in the old colony; and it is no less notorious that the children have substituted a poisonous liquor for the salutary beverage, which almost exclusively cheered the hearts of their virtuous ancestors.—The views of men are often materially affected through mere indolence of temper, no less than through the cloud of prejudice. Averse to the labor of reading and inquiry, they adhere pertinaciously to the routine of their predecessors, and treat with equal contempt the lessons of experience, and all suggestions of improvement. It is not, however, desirable that former modes of practice in husbandry should be abandoned until it shall be incontestably proved, that a system more adapted to our circumstances, and in all respects of superior utility, can be founded on the surest basis. It is not to be required of our farmers to subject themselves to the expense and uncertainty of novel experiments; but he who possesses capital and leisure, and who, in the spirit of investigation, shall put in execution a hundred new projects, although in ten only shall he be successful in the acquisition of useful knowledge, will be entitled to public praise and respect. These pages contain no speculative or visionary projects, nor recommend any untried experiments. Although a portion of information is derived from European authors, no inconsiderable part of it has been collected from the practical experiments and observations of our own countrymen. There is, therefore, no part of this production but what may be adopted as applicable to our climate, and calculated to promote the interests of the cultivators of our soil. The knowledge respecting the proper management of fruit trees is contained in numerous volumes, and in incidental papers, published in periodical works. My object has been to collate and embrace all the principal circumstances relative to the subject, and condense the whole into a small compass, that shall be accessible both to the pecuniary means of all, and to the intellectual powers of the most ordinary capacity. The authorities to which I am chiefly in-

abited, are the several encyclopedias, E. esyth on Fruit trees, and the valuable periodical publications of your society, and various other similar productions. If, in a few instances, it shall appear that I have employed borrowed language without marks of quotation, my apology is, that I have copied from minutes collected at various times, without reference to the source whence derived; not that I would wittingly pilfer the cultivated fruit of others, and impose it upon my guests as the result of my own industry."

COMMUNICATION.

Mr. Kenrick appears to have misapprehended Mr. Pickering's statements in regard to the worms which prey on timber. It is well known that the sea-worms eat hard pine and white pine and white oak—and doubtless most other kinds of wood—placed or used in sea-water; and hickory was mentioned as one exception; but without any reference to the season of the year when felled. It was Mr. Joseph Cooper's assertion, which Mr. Pickering recited, that white oak and hickory poles intended to be split for hoops, should always be cut when the sap was running freely, because then they would not be infested with the worms which produce what is called "powder-post." And this assertion of Mr. Cooper's was confirmed by a distinguished mill-wright in Pennsylvania, who, for the same reason, directs hickory, designed for the cogs of wheels, to be cut when the sap is running freely in the spring. his powder-post worm has no relation to the worm which is bred in sea-water.

In Mr. Pickering's address published in our last page 221, 1st col. 18th line from bottom, for "sown in it them," read "ploughed in," &c.

FARMER SUMMARY OF NEWS.

CONGRESS.—SENATE.—A bill has passed the Senate for appropriating \$1000 for the erection of a monument over the tomb of the late Vice President Gerry. A bill has also passed to be engrossed appropriating \$10,000 for the purchase of apartments for the commodation of the U. S. Circuit Court in Columbia district. A resolution was offered by Mr. Smith, of d. and agreed to, that the committee of Finance be directed to inquire into the expediency of admitting silver coins of Mexico as a currency in the United States at their true value. A new bill was reported on the 4th inst. for abolishing imprisonment for debt. A bill to punish frauds committed on the Departments of government was read twice and referred.

HOUSE.—A committee on the subject made a report quitting Messrs. Gales & Seaton of all blame imputed to them for having omitted to print some parts of certain documents sent from the Department of the Treasury. The Committee likewise stated that they could obtain no satisfactory information with regard to the omission complained of. This report was ordered to lie on the table. A bill supplementary to the existing acts to provide for revolutionary pensioners passed the House and was sent to the Senate for concurrence. The new Tariff bill has been debated at great length, and no decision was had at the date of our last accounts.

THE MASSACHUSETTS LEGISLATURE closed its session on the 11th inst. Among the most important public acts which have been passed, are an act to apportion and assess a tax of \$75,000—an act authorizing the Governor, with advice of Council, to appoint an agent, or agents, for advocating, at Washington, the claims of Massachusetts upon the United States for the expenditures for militia services during the late war—an act in addition to the acts for regulating, training, and governing the Militia, which provides that the militia shall be called out only twice a year, but the officers, in addition, are to appear three times for drill—an act in addition to several acts now in force regarding the limits of prison-yards and the discharge of our debtors now in prison. This provides that the prison limits in Suffolk county shall be co-extensive with Ward No. 5, as now defined, and in all other counties in the State not beyond fifty rods from the jail. It provides, also, that all persons who do not apply for discharge from imprisonment within ninety days from the time of their commitment, shall be put into close confinement and there kept until discharged by due course of law. The thanks of the Senate were pre-

sented to the Hon. John Phillips, President of the Senate, and those of the House to the Hon. Levi Lincoln, Speaker of the House, and appropriate answers were returned by each.

FOREIGN.—By an arrival at New York on the 9th inst. London and Liverpool papers have been received from the 19th to the 30th Dec. These give rumors of meditated hostilities between France and Spain. The French monarch, however, appears to be disposed to maintain peace between the two countries. But the other members of the Holy Alliance, particularly the Emperor Alexander, seem determined to interfere with the internal concerns of Spain, and force the Cortes to restore the ancient order of things. The internal situation of Spain is said to be very deplorable. The remnants of the army of the Faith have formed themselves into bands, which harass the troops of Mina. The recruiting of the Spanish armies is proceeding with vigor, and the manufacturing of arms of all descriptions is going on with great energy.

An article from Madrid, professing to be official, states, that an alliance offensive and defensive, has been concluded between Spain and Portugal, under which, the latter is to furnish 8,000 troops to the Spaniards, and the force is to be increased as occasion may require.

The affairs of the Greeks are said to be, on the whole, prosperous. Mr. Canning, the British Minister, it is said has sent a declaration to the Porte, that the Grand Signior must render the Greeks independent, or England must take them under her protection. There have been some changes in the Turkish ministry, which threaten a war with Russia.

Canaris, a celebrated Greek Captain, with two fire ships on the 10th of Nov. at 7 o'clock in the evening, made an attack upon the Turkish fleet, and burnt the Admiral's ship with such rapidity, that out of the whole crew, not more than 20 or 30 escaped; two frigates were likewise consumed. This captain, in the excess of his ardor to hasten the explosion of the fire ship, took up burning coals with his hands, which he threw upon the fire ship, and his hands were severely burnt. The Greeks have declared a number of ports in the Mediterranean in a state of blockade, and the English commanders have ordered the declaration to be respected.

DOMESTIC.—The important question of the right of a state to grant the exclusive privilege of steam boat navigation upon its waters is to be argued before the Supreme Court of the U. S. sitting at Washington.

The *Life of James Otis*, by Wm. Tudor, Esq. has just issued from the press of Messrs. Wells & Lilly, of this city. The work is highly spoken of by adequate judges, and is said to be well written and to contain much valuable information.

At the Municipal Court in this city, on Wednesday last, Edward P. Perley was sentenced to five days solitary imprisonment, and five years hard labor in the State Prison.

A store occupied by Messrs. Heywood & Fisher, No. 4, Central-street, Boston, was forcibly entered on the night of the 8th inst. and a large quantity of goods was stolen therefrom.

On Friday morning last, the Woollen Factory at Northampton, belonging to J. & C. Cook, was destroyed by fire, with all its contents. The amount of loss is about 12,000 dollars, and there was no insurance.

American Iron.—The Bennington (Vt.) Gazette assures us that an extensive establishment is in successful operation in that place for the manufacture of iron; and that the pigs are pronounced by competent judges to be equal, if not superior to any iron made in the U. States. A vein of soft chrysalized and semi-transparent stone has likewise been discovered in that town, which has been found to be more useful in fluxing iron in the furnace, than any other ingredient that has ever been tried.

The *Pioneers*, a new novel from the pen of the celebrated author of "The Spy," has recently been published in New York. The work sold with a rapidity unprecedented in the annals of American literature. We have not seen the work, but judging from pretty numerous extracts, which we have seen, we should believe the book fully merits the rapid sale which it has met with.

A young man by the name of Tompkins, who lived in Ottawa District, U. C. lately set out, in the morning,

to travel through a forest with a loaded Team and four children of one of his brothers. The weather changing to a storm, and his horse becoming tired, he left the children with the horse, to seek assistance at the nearest habitation. On the return of the party, the three youngest, who were boys, were found frozen to death, and the eldest, a girl, ten years of age, was so much frozen that the loss of her feet was apprehended.

Two persons, named Reuben Craft and Abraham Mead, were found frozen to death at Redmill, Delaware county, N. Y. It is thought that they got lost in the night, in attempting to go through a thick wood about three miles in extent.

On the 25th of January, as Mr. Peter Demarest, of Newfoundland, N. J. was fixing a flint in his gun, it accidentally went off, and the contents entered the side of his wife. With a solitary exclamation—"Peter, you have hurt me," she fell and immediately expired. This fatal accident has so deeply affected the mind of the wretched husband, that it was feared he would be deprived of his reason.

A cow of the Bakewell breed, belonging to Widow Sarah Hoyt, of Sandwich, N. H. on the 14th January, brought a bull calf, which was very handsome, well proportioned, and weighed the same day 142 pounds.—*N. H. Patriot.*

A sugar house in Love-lane, New York, owned by Mr. Henry Willett, was destroyed by fire on the night of the 25th ult. together with the stock amounting to upwards of \$6000.

THE SLEEP OF THE SLUGGARD.

BY T. G. FESSENDEN.

O list to an indolent lump of live lumber,
Whom slothfulness binds with invisible bands.
"A little more sleep, and a little more slumber,
A little more folding together the hands.
"I've a villainous cold—and my head—how it aches!
The north wind is blowing, and stings like a hornet,
And as to this rising as soon as day breaks,
'Tis a vile vulgar habit, and gentlefolks scorn it.
"I'm none of those wretches who labor for bread
Through foul or fair weather, whatever may hap;
I mean to enjoy both my table and bed,
And so I'll turn over and take 'tother nap.
"I've money enough, and can live at my ease,
I cannot be caught in necessity's trap;
I'll sleep every day, till the next, if I please,
And so I'll turn over and take 'tother nap."
His heavy, hydropical carcass he turns,
And sinks in uneasy, intemperate rest,
Till dim in his bosom the lamp of life burns,
While snorting with night-mare, and plethora prest.
What horrible visions his bed hover o'er,
The phantoms of spleen, and the blue devils dire!
Like Gorgons and Hydras of fabulous lore,
And red dragons vomiting rivers of fire!
Now clings to the side of a prominent steep,
O'er a rough, roaring cataract hangs by a hair,
Now suddenly sinks in a bottomless deep,
And starts, half awake, with a shriek of despair.
Thus rolls, like a porpoise, o'er billows of down,
Grows big as a mammoth, and fat as a seal,
Lives a plague to his friends, or a charge to the town.
And dies to make worms a most plentiful meal.
Ye sons of Columbia, shun the syren of sloth,
For if you submit to her leaden control,
You'll find, when too late, like a venomous moth,
She eats up the substance, and poisons the soul.
If the wizard of indolence takes you in hand,
Quick break from his grasp, or you're quickly undone,
Your limbs will be lithe as a wickapay wand,
And your sinews be soften'd, like wax in the sun.

"Wickapay is the popular name for a shrub, which is remarkably flexible.

WIT.

Of those who claim it, more than half have none,
And half of those who have it are undone.

Natural History.—A traveller was talking of having seen, in some foreign country, bed bugs, so large and powerful, that two of them would drain a man's blood in a night. Sir John Doyle, to whom this was addressed, replied, "My good sir, we have the same animals in Ireland, but they are known by another name. We call them *humbugs*."

The difference between long-tailed, and short-tailed horses.—The following singular advertisement was painted in large letters on a board, placed on the side of a field, in the neighborhood of Greenwich, Eng.

"Good grass for horses. Long tails, three shillings and sixpence per week; short tails, two shillings and sixpence per week." The difference in the charge was made because the *long tails* can whisk off the flies, and eat at their leisure, while the *short tails* are running about from morning till night.

He that does not give his son a trade or a profession, learns him to be a knave, and perhaps a thief. This, more especially holds good as respects the children of the poor. Poor children that are brought up neither to a trade, nor any regular occupation, are laid under a sort of necessity to become rogues for a livelihood.

There is a labor of the mind as well as of the body, and some employ themselves very usefully to society, who do but little with their hands. But the labor of the body, if not excessive, strengthens the mind, and those who do not labor from necessity, should labor for health.

From the American Daily Advertiser.

Mr. POULSON—Seeing an account of some microscopic animals, found in *pepper, water, &c.* in your paper a few days ago, I take the liberty of adding some observations, extracted from different authors concerning this minute part of the creation. Parts of *insects, scales of fish, animal and vegetable infusions*, are very interesting objects for microscopic observation. The illustrious naturalist, Swammerdam, had a more perfect apparatus than any one of the age in which he lived. His apparatus, I think, is now in the Royal Society, and it is said to have about 300 different magnifiers; he manufactured most of his utensils himself. His "chief art," says Mr. Samouelle, "consisted in manufacturing scissors of exquisite fineness, with which he was able to dissect the smallest insects; and the intestines of bees." I shall commence by drawing the reader's attention to certain small vermiform animals, found in vinegar, which may sometimes be discovered even by the naked eye. These are interesting, and are always to be had without either expense or trouble. Animals, almost exactly like them, may be found in paste, when kept until sour; and by keeping the surface of the paste continually moistened, they may be preserved for almost any length of time. The next kind are minute animals, of various forms, found in an infusion of hay. These are always to be had, as every one has it in his power to obtain them, by placing some hay in a vessel of water, and letting it remain exposed to the sun's heat until a pellicle be found on the surface, in which myriads of these animals may be found. An innumerable quantity of animals, so small as to require the aid of a microscope, may be found in sea water. All of those who have witnessed that beautiful phenomenon, of the sea being luminous, may not know that this appearance is owing to small jelly-like bodies, which are phosphorescent, or have a luminous property: by the assistance of the microscope, these animals are found to possess a mouth, stomach and intestines; but their extreme minuteness renders their dissection and examination very difficult. In the water of ponds and ditches, and all stagnant water, animalcula are found in abundance. Those small insects, &c. which inhabit pools and standing waters, may be procured by means of a net, made sufficiently open to suffer the water, but not the insects, to escape. The mud must be brought up from the bottom, and in it many interesting animals are found, which may be picked out and put into a phial of clean water; by this means, they may be kept alive. In fact,

there is scarcely any part of the creation which does not afford an extensive field for microscopic inquiry. W.

From the Village Record.

A distant correspondent has sent us quite a curiosity: a LOVE LETTER; not one of your modern, whining, crying and blubbering epistles, talking of flames, broken hearts, and dying, and all that, but a good old fashioned letter such as our proud spirited grand mothers used to write to swains when faithless. Now-a-days, forsooth, if a lover leaves his own mistress for a new one, he likes better, the melancholy, broken-hearted dame brings in her action for something like thousand or two dollars, and solaces herself for the loss of a lover's person in the hope of good portion of his wealth. ELIZABETH MATTHEWS was a girl of spirit, an honor to Beverly and a praise to old Massachusetts. Such women were fit to become the mothers of soldiers—I warrant it, if the truth could be known, that she afterwards married an officer, at least a high in commission as an Ensign.—But the letter. It is directed

"To Mr. Michael Brown
in Exeter.

These with care."

No proof is necessary to convince us it is genuine original letter. It carries with it intrinsic and irresistible evidence that it is what purports to be. Here it is.

"BEVERLY, March ye 21, 1777.

"Mr. Michael Brown,

"SIR—I once more take an opportunity to write you, to let you know I am well, through the goodness of God, and can live without your company—but pray don't get published the third time. I should be glad if you would come and get your clothes, for I don't want no conce with them—for I hope that you will take care not to promise any young lady more than you intend to perform; for I'd have you consider that God can see further than Exeter—although you thought you did me a great injury to go and leave me, I never thought so; for I'm well contented with your absence, and beg God to keep you there if you like it. So no more at present—but I remain a well-wisher to all the true hearts—and a curse to all false ones.

ELIZABETH MATTHEWS."

Nicholas Rowe, the poet, one day went pay his court to the lord treasurer Oxford, who asked him if he understood Spanish well? He answered "No;" but thinking that his lordship might intend to send him into Spain on some honorable commission, he presently added, "that he did not doubt but he could shortly be able both to understand and to speak it." The earl approving what he said, Rowe took his leave, and, retiring a few weeks to learn the language, waited on the earl to acquaint him with it. His lordship asking him "if he was sure he understood it thoroughly?" and Rowe affirming that he did, "how happy are you Mr. Rowe," said the earl, "that you can have the pleasure of reading and understanding the history of Don Quixote in the original."

An eminent Grocer Company in Dublin announce in the newspapers in that city, that they have whiskey for sale which was drank by his Majesty while in Ireland.

NEW ENGLAND FARMER.

VOL. I.

BOSTON, SATURDAY, FEBRUARY 22, 1823.

No. 30.

DISEASES OF CATTLE.

SELECTED AND COMPILED FROM THE BEST AUTHORS,
BY THE EDITOR.

On the management of Cows, when they are near the time of calving.

"The diseases, which most commonly occur at this time, are strangury, or difficulty in voiding urine, and costiveness; and these it may be highly necessary to attend to, as they may, if neglected, be the cause of the cow slipping her calf. When strangury is accompanied with costiveness, which is generally the case, and is often the cause of the complaint, the bowels must be opened by a laxative composed of a pound of epsom salts dissolved in a quart of gruel; a clyster should also be given, consisting of two quarts of warm water, and four ounces of linseed oil. This may be repeated two or three times in the course of two hours, if found necessary. Should the strangury continue after the bowels are emptied, give the following drink:

Take of camphor	2 dr.
to be powdered and mixed with	
spirits of nitrous ether	1 oz.
Tincture of opium	1/2 oz.
Gruel in which one ounce of nitre	
has been dissolved	1 pt.

(Mix.)

"Many cows have been lost by allowing them to be too fat at the time of calving; they are then said to die of the milk fever. It is advisable, therefore, when a cow, far gone with calving, is in too good condition, to reduce her by changing the pasture, which is preferable to bleeding or physic; but if she has approached too near her time to admit of this change having any effect, then bleeding will be proper. When a cow, in high condition, appears to be ill and feverish soon after calving, let her be bled to the extent of three quarts, and take a pint of castor oil. Should the fever continue, and particularly if it appears to increase, the animal expressing great uneasiness, with a wildness in her appearance, great redness of the upper eyelid, and quick motion of the flanks, the bleeding must be repeated. Many cows have been destroyed by the stimulating medicines that are commonly recommended and given."—*White's Treatise.*

Dr. Skellett recommends a similar treatment of the strangury in cows, and adds "The cow should have plenty of diluting liquors, such as warm water, gruel, &c. and mashes made of bran, or pollard, with a little malt. In two or three hours after she has had the drink and clyster, it will be necessary to drive her gently about for a quarter of an hour, as it greatly assists the operation of the medicines.

"To prevent this disease, the animal ought to have air and exercise daily, and such food given her as is of a laxative nature, which will be of the greatest utility in her latter months of gestation."

Inflammation and swelling of the Udder.

This disease attacks cows about the time of calving, and is sometimes so considerable as to

cause an abscess to form. As soon as it is observed, let the animal be bled freely, and take a pound of epsom salts dissolved in a quart of gruel, to which a little castor or linseed oil may be added. The swollen udder should frequently be fomented with a decoction of mallows or elder. The best method of doing this, is to dip large woollen cloths in the hot decoction, and after wringing them, let them be applied so as to cover the whole udder; this process should be continued for some time, and repeated several times a day. When, by these means, the inflammation has been removed, some degree of hard, but not painful swelling may remain; to disperse this, the following liniment may be rubbed on the part once or twice a day:—

Liniment.

Take of linseed oil	4 1/2 oz.
Spirits of turpentine	1 oz.
Liquor of ammonia	1/2 oz.

Inflammation of the udder sometimes occurs in consequence of catching cold, or a *chill*, as it is more commonly termed; in this case, the appetite is diminished, the cow stales, the breathing is quickened, and there is some degree of fever. Here bleeding is generally necessary at first, and the following warm laxative:—

Common salt	6 to 8 oz.
Oil or lard	6 oz.
Flour of mustard	1 oz.
Whey or water	1 qt.

(Mix.)

The animal should be taken under cover, and fed with warm mashes of bran or malt. One ounce of nitre may be put into her water, morning and evening.

This inflammation is generally confined to one or two quarters of the udder, but sometimes spreads over the whole. The milk drawn from the infected quarter is of a yellowish or whey color, and contains small flakes or curds. When the inflammation is not seasonably checked, it often proceeds to suppuration. If the matter be suffered to accumulate, a large abscess will form, and the gland, or quarter will be so disorganized as to be incapable ever after of forming milk. It is probable, however, that, when this happens, the other three quarters will have their capacity for forming milk gradually increased. Whenever matter has been formed in the udder, and can be distinctly felt, it is proper to open it in the lowest part, that the matter may flow off freely. When this has been done, the part should be kept clean, and no matter allowed to lodge in the cavity, which should be syringed with warm water. To get rid of the matter, it sometimes becomes necessary to make an opening in the teat, a little above its extremity, or the orifice. There is no occasion for cramming tents into the cavity, or daubing the udder with filthy ointments; it is quite sufficient to bathe and syringe with warm water twice or three times a day, which will prevent the accumulation of matter; and if the healing process goes on languidly, a mixture of spirit and water, or a solution of white vitriol may be injected.

Cows that are near calving should be attended to with reference to their complaint; and if it

is observed to be coming on, they should be bled, and milked. They should be kept in a bare pasture, or put into a cow house and be allowed but little hay, and a little of the liniment above mentioned, or some other emollient ointment made use of to soften the udder.

What by some is called the Swelled Udder, requires no other treatment than rubbing the part with elder ointment, and as the complaint is merely temporary, from the extension of the milk vessels, and is, in fact, a proof of a good milk; it will soon yield to this application.

Wounds of Cattle.

"The wounds of cattle are most commonly caused by goring each other with their horns, or by breaking over fences; and, when deep or extensive, are generally followed with considerable inflammation. The treatment of these wounds, though represented by farriers as an intricate and mysterious branch of the art, is, in fact, extremely simple. When the wound is considerable, and some important parts have been injured, the irritating treatment commonly adopted by farriers, often destroys the animal, and, in slighter wounds, their stimulating applications rather tend to retard, than promote recovery. In deep and extensive wounds, affecting important parts, every method must be employed, as early as possible, to prevent a fatal inflammation from taking place. Bleeding is the first remedy; and immediately after, let a purgative or laxative drink be given, receipts for which may be found under the head *Dysentery*, and other diseases.* On no account should the wound be probed, or have any tents crammed into it, nor should any stimulating mixture be applied. The emollient fomentation [a decoction of mallows and elder] directed for swollen udder, is the only application that can be used with advantage, until the inflammation has subsided; the fomentation should be continued for a considerable term, and repeated frequently.

"When the inflammation occasioned by the wound, has been removed it will be proper to examine it with a probe, to ascertain whether any matter be confined or not; as in that case, it may be necessary to enlarge the original wound, to give it vent, or make an opening in another more depending situation, that it may run off freely. Some stimulating application may also be proper at this period, such as a solution of blue vitriol; or

Tincture of myrrh	2 oz.
Corrosive sublimate	12 gr.

"One part of oil of turpentine to two parts of sweet oil form a good digestive, as it is termed. And, if an ointment is preferred—

Take of hog's lard	8 oz.
Bees' wax	1 oz.
Common turpentine	6 oz.

"Melt them together; and, when taken from the fire, add one ounce of powdered verdigris, continue stirring the mixture until it is cold.

"With respect to sewing up a wound, as it is called, there are circumstances which sometimes

ORIGINAL COMMUNICATIONS.

The following letter to Mr. POMEROY, Vice President of the Massachusetts Agricultural Society, we are informed, was written by a gentleman who has had much experience as an Orcharist. It contains valuable information, and we are happy to give it a place in our columns.

Newton, Jan. 11, 1823.

render it highly improper; in deep wound, for example, where the external opening is not very large, or in wounds, where the divided parts have receded from each other, and there is difficulty in bringing them together; in the former case, the matter would be confined; in the latter, much irritation would be caused by the stitches. In both cases, the inflammation would be considerably increased; but in superficial wounds, and where a flap of skin is separated, it will be proper to stitch it up; but on no account, should there be any stimulating fluid introduced, such as tincture of benzoin [Friar's balsam] as Dr. Clater advises. It would be sufficient, should there be any dirt, or other matter, about the wound, to wash it off with warm water. Wounds of the belly, through which the bowels press out, are highly dangerous, and require the most delicate management. The first thing to be done, when this accident happens, is to put back the bowel into the belly as tenderly as possible; but if any dirt, hair, or other matter be observed on the intestine, it must be carefully washed off with warm water. When the bowel has been replaced, the wound must be stitched up, by means of a crooked needle and threads doubled, or small twine, well waxed (with bees wax;) a bandage is then to be applied. The animal is to be kept at rest, on a spare, opening diet, of grass, or bran; and, if in any degree costive, a dose of castor oil may be given. The treatment of the wound is of little importance: the great object is to keep the bowel in its situation. It sometimes happens, that a great deal of air gets into the intestine, after it has escaped from the belly, and so distends it as to render it difficult, if not impracticable, to replace it through the original wound. When, after a careful and patient trial, this is found to be the case, the wound is to be enlarged, so as to allow the bowel to be replaced.—This must be done cautiously, the knife being guarded by the forefinger.

Bleeding from wounds seldom proves dangerous in cattle, and, if left to nature, generally stops in a short time; indeed it is the best plan not to meddle on these occasions: for, though the bleeding may appear formidable to persons not accustomed to such sights, it is really not dangerous; and unless some large vessel has been wounded, which would bid defiance both to styptics and to pressure, it may safely be left to nature. Should it be thought necessary, however, to stop the bleeding, the most effectual mode of doing it, next to that of tying the blood-vessel, is pressure, by putting bolsters of tow or sponge to the bleeding part, and supporting it firmly with bandage. During the progress of the wound towards healing, the new flesh often rises above the surface, or appears to be produced too luxuriantly, to check this, a little powdered blue vitriol, mixed with bole, may be sprinkled on the part.—*White's Treatise.*

(TO BE CONTINUED.)

"Dr. Black has calculated that it would take fourteen millions of films of gold, such as is on some gilt wire, to make up the thickness of one inch; whereas fourteen millions of leaves of common printing paper would occupy 3-4th of a mile in thickness. Vol. ii, page 654. The ductility of gold is such, that one ounce of it is sufficient to gild a silver wire more than 1300 miles long."

SIR—I have been much pleased with your valuable communications (in the Massachusetts Agricultural Repository & Journal) on the culture of flax, and on the improvement of our farms in New England. For each of these publications please to accept my thanks. I have also, with much pleasure, read Mr. Pickering's valuable communication on the best time for felling timber. I think he is substantially correct, with one exception in page 137, vol. 7, where he says, "*the larger the grain, the harder and stronger is the wood.*" From experience I certainly know that coarse grained wood, though heavy is brittle, and far from being the *strongest*. Ask any Wheelwright and you will be told that coarse grained wood is unfit for spokes or carts, and too brittle for pin wood. The strongest timber will always be found in a medium between the coarsest and the finest grained.—The information he has given of the durability of Mr. Cooper's fences, strikes me as of vast importance to the great body of American farmers. The facts stated by Mr. Cooper are undoubtedly correct; and there must have been an adequate cause why the timber felled in barking time was so evidently the most durable. No one can doubt but the vessels of trees are full of sap during the winter season. As the spring comes on, the sap becomes remarkably limpid, so that our sugar makers have found, in March, that by making a small incision in a tree they can soon draw off nearly all its juices. I apprehend that by the warmth of the sun, this limpid sap finds its way to the bark, where in the course of the season it forms the new circle of wood. It is worthy of notice, that, in our climate, there are but about three months in a year in which the bark may be stripped with ease, during which time nearly the whole growth of the trees takes place; and, I am strongly inclined to believe, but little if any sap remains in the heart part of the trees. To what other cause than the absence of the sap, can we fairly impute the extraordinary durability of Mr. Cooper's fences which were felled in the month of May?

Persuaded of the correctness of the foregoing ideas, in regard to the rapid flow of sap from the bodies of trees early in the spring, wherever any cutting or incision is made, I have for a number of years deferred pruning my trees till June. And I am satisfied that the only proper time for pruning is while the bark will peel—in June or July. I have made many experiments, and find where limbs have been taken off either in autumn, winter, or early in the spring, it has invariably proved injurious to the trees—much of the sap has exuded, and rotteness ensued, and soon penetrated to the heart. I have no doubt but most of the decayed, hollow, and rotten appletrees so commonly to be seen, were occasioned by unseasonable and improper pruning. I have also found that the stumps of the limbs amputated in June or July will be almost immediately encircled with a

ring of new wood, and in a short time, in proportion to the thriftiness of the tree, and size of the limbs, be completely healed over.

I well remember a fine thrifty orchard of appletrees of grafted fruit in the south of Newton, more than fifty years ago, so productive as to excite envy among the neighbors (for that base passion existed then.) Mr. Ward, the owner, always pruned this orchard pretty thoroughly in March, and I remember to have heard him say,—"it would ruin appletrees to prune them in the summer." This fine orchard soon went to decay, and for more than twenty years past there has been scarcely the remnant of a tree to be seen on the ground.

I am, Sir, with due respect, yours,

J. KENRICK.

Samuel W. Pomroy, Esq.

P. S.—Permit me in a few words further, to urge the importance of pruning only in barking time. The sap being then evidently near, and in actual contact with the bark, instantly flows to form the healing circle of wood, and there does not appear to be a drop wasted. When pruning is done at any other time of the year, *no new circle of wood will be formed around the stumps of the branches removed*, and for this plain reason,—that the sap is in the body of the tree and not on the outside. This being the case, wherever the wound is made, when the sap is, or becomes, limpid, it will flow out like blood from an animal body.

J. K.

TO THE EDITOR OF THE NEW ENGLAND FARMER.

SIR—As any thing relating to agriculture, however small, as to an individual, may be valuable in a public view, I send you for your paper (if you think it worthy) the following infallible cure for the diarrhæa, looseness, or scouring in calves. I call it infallible, because in thirty years use of it I have not known of its failing to effect a cure by *once giving*, but in *one* instance, and in *that* a *second* effected it. I think it much more convenient for farmers, than the medicine recommended in your paper, No. 27.

Put into a suitable bottle about half a pint good Cider, (not sweet nor bottled,) then open a vein in the Calf's neck and let into the bottle about the same quantity of blood; shake it quickly well together, and put it down the Calf's throat, before it has time to coagulate, which is easily done with the bottle.

I am, Sir, yours respectfully,

LOVETT PETERS.

Westboro', Worcester County, Feb. 7, 1823.

TO THE EDITOR OF THE NEW ENGLAND FARMER.

SIR—There is probably no part of New England where the land is better adapted to the production of Indian Corn than the valley of the Connecticut river, nor no part where its culture is better understood; hence it is that we see in the markets of New York and Boston the fattest beef from this section of country, it being the practice here during our long winters to feed the cattle with as much corn meal daily, as can be crowded into them, and to turn them off in the spring of the year, after having been fatted on this costly food from 100 to 150 days, at an expense, on an average, of thirty-five bushels of corn, and a ton and a half of hay to

a bullock of 1000 lbs. weight. The almost invariable result, for the last six or eight years, has been, either the loss of hay or corn, and sometimes of both—the cattle having been sold for only a little advance in the spring over the cost in the fall. Habits are stubborn things, and it is very like the same practice and the same result will follow for six or eight years to come, till at length the farmers of the valley must yield to the superior skill of those on the mountain towns, who raise the cattle, and who are latterly getting into the way of stall feeding them in the winter at much less expense, by substituting roots for corn during the first half of the time they are kept in the stalls; and although they may be obliged to buy some corn from the valley during the latter part of the time, yet on the whole, they get their cattle well fattened in the most economical way. They have, therefore, no inducement to sell their grass fed cattle in the fall of the year at a less price than heretofore, and the consequences will be that the farmers of the valley must either adopt their mode of feeding, or put up with a loss for years to come as they have done for years past. But why do they persist in feeding with corn during the whole of our long winters when they can raise a thousand bushels of turnips on an acre of land? I answer—It is the force of habit—and so long as they will neglect to raise any kind of roots, either turnips, beets, carrots or potatoes to eke out their corn cribs, so long will they make a losing business of fattening cattle. I have had it on my mind, Mr. Editor, to write an article for your useful paper on this subject before now. It has, however, been put off, and I doubt whether I should have wrote at all, if a fact to corroborate the foregoing statement had not recently come under my own observation.

Capt. Billings, of Chesterfield, (one of the mountain towns) sold a pair of cattle the other day to Mr. Theodore Clap, of this town, which had been fattened wholly upon turnips and potatoes. They ought to have been fed two months longer with as much corn meal as they could have eaten, but they were in fine order, and Mr. Clap was induced to drive them to Boston. I took their weight at the hay scales when they started—the largest ox weighed 1967 lbs. and if 56 lbs. are deducted for loss in driving to Boston, the real weight there would have been only 1911 lbs. alive—the quarters, hide, and rough tallow weighed 1593 lbs. of which the latter was 236 lbs.—the offal therefore was but a sixth part. This ox handled well and had a thin neck, but on the whole he was rather a coarse creature, with high bones and loose joints. His mate was what the feeders call a *fine ox*, and weighed here, alive, 1503 lbs. and one third less in Boston when dressed. A grass fed ox of this description will fetch about 10 per cent. more on the hundred for the stalls, than one of coarse make, but it seems in this case, the fine smooth ox had one pound in three of offal and the coarse ox only one pound in six.—If this fact will hold good as a general rule, it is time for the feeders of cattle to make as great a change in their habits of buying as of feeding them.

The object of this communication, Mr. Editor, is to urge it upon farmers to test things by actual experiments, and not to take for granted what they do is best, because it has been prac-

tised from time immemorial. With that view I would recommend the Agricultural Societies to give the following premiums, viz:

1st. — \$100. to the person who shall prove by actual experiment, the cheapest and best way of fattening cattle in the winter, one yoke to be fed with corn meal alone, and another yoke with corn meal only half the time, and with roots the other half.

2d. — \$100. to the person who shall prove in like manner, the most profitable cattle to put into the stalls—one yoke to be high boned, long legged, smart working cattle; and one yoke to be fine, short legged, small boned, smooth cattle, and in all cases to be weighed when first put into the stalls, and at least once a month while fattening.

Your friend, T.

Northampton, Feb. 1823.

From the Massachusetts Agricultural Repository.

ON GRASSES.

To the Recording Secretary.

DEAR SIR—At your suggestion, that there might be some utility in publishing the result of some experiments made the past season upon the evaporation of certain Grasses, &c. in the process of drying or making for safe and useful preservation; I herein inclose the same to you for such disposition as you may think proper.

The great object of research seems to be, what is that admirable process of nature, (as yet too little understood,) by which vegetable life is sustained and promoted? And how can this be traced or pursued so as to allow to human skill and ingenuity the nearest approach to the wonderful perfection of the great design? That this may be usefully done—that it is indeed partly accomplished, and that we are in full progression to this effect, cannot be doubted. The discoveries and improvements in those sciences, particularly in Europe, which have a reference to the theory of agriculture, have of late shed such a light upon the subject, and these have been so followed up by practice and confirmed by experience, that the result is indeed most auspicious, and marks the present age as an era of improvement.

But the process of nature is indeed subtle and mysterious, and can only be unfolded to the most earnest and diligent inquirer.

An accurate knowledge of the elements which compose vegetable life, and different degrees in which they prevail in its formation, cannot be useless, in looking back for its origin and first principles. The tendency of most modern discoveries in relation to vegetation has been to shew the great prevalence of water in its composition. This has not only been made to appear by the analysis of plants, but it has to the astonishment of those who prosecuted these researches, appeared, that an acre of ground gave, according to its humidity, from 2 to 4000 gallons of water to the atmosphere in a day by evaporation only. The operation of this element has appeared so extensive that it has led to the most delicate experiments, and induced some even to suppose it the sole source of vegetation.

A curious instance has been frequently published, of a willow inserted in a leaden vessel with a given quantity of earth, and supplied constantly with water; the willow thrived and acquired great growth and weight in a few

years;—whilst on a subsequent examination of the soil, it appeared no sensible diminution had taken place.

It is observed by an ingenious writer,* to whom agricultural science is much indebted, "That although the mode in which manures operate on soils is not so obvious to the senses as to be fully understood, there are three ways in which water promotes their improvement. It preserves a favorable degree of temperature; feeds by conveying nourishing substances; and so as a pure element, it is beneficial." To prove that water enters largely into the composition of vegetables, and is thus advantageous, the same writer observes—"That plants cut green, and afterwards dried, lose by exsiccation 66 to 70 parts out of 100."

The loss of weight by drying will be found in this country to vary very essentially from what takes place in Scotland, especially as it respects different plants. But our hay is of necessity made lighter by the heat of our summer, as well as for the purpose of its being stowed in large bodies and tight barns.

It should be premised, that the time of cutting the several grasses, &c. in the following statement was the same as is usually practised by husbandmen in our State.

Of 100 lbs. of vegetables cured in 1822, the product was as follows, viz.

100 lbs. of Green white clover,	gave of hay	17 1-2 lbs.
100 " of Red do.	gave	27 1-2 "
100 " of Herds' Grass,	gave	40 "
100 " of Fresh Meadow,	gave	38 "
100 " of Salt Grass,	gave	39 "
100 " of Mixed, 2d crop on Eng. Rowan,		19 3-4 "
100 " of Corn Stalks, gave		25 "
100 " of do. cut in milk with the ear,		25 "

It is to be observed, that the weight will vary from ripeness, and many other causes, such as wetness of season, shade, thickness of growth, &c. I am, Sir, with respect, yours,

JOHN WELLES.

Dorchester, Oct. 1822.

* Sir John Sinclair.

To prevent polished Hardware and Cutlery from taking Rust.

Case-knives, snuffers, watch-chains, and other small articles made of steel, may be preserved from rust, by being carefully wiped after use, and then wrapped in coarse brown paper, the virtue of which is such, that all hardware goods from Sheffield, Birmingham, &c. are always wrapped in the same.

To clear Iron from Rust.

Pound some glass to fine powder, and having nailed some strong linen or woollen cloth upon a board, lay upon it a strong coat of gum water, and sift thereon some of your powdered glass, and let it dry; repeat this operation three times, and when the last covering of powdered glass is dry, you may easily rub off the rust from iron utensils, with the cloth thus prepared.

Some profane people would say, it was a reflection upon creation, that of all living things, only two could be named which would continue true to us while in a state of poverty, viz: a dog, and a consable—as the former is never known to desert a human being even in the lowest state of degradation and the latter with equal pertinacity. —Metropolitan University.

AN ADDRESS

Read on October 9th, 1822, at *Hallowell*, before the Agricultural Society of Maine, on the day of its Annual Meeting, and after the Agricultural Exhibition of the year had taken place:—by WILLIAM LADD, Esq. of *Maine*.

When we look around on mankind, and contemplate on the great variety of occupations in which they are busily engaged, in their eager search after happiness; we naturally inquire, which, of all these various pursuits, is best adapted to obtain the desired end? And when we consider man as a social being, our inquiry will not end in his individual happiness; but will be extended to the society, the nation, and finally to the whole race, of which he is a member.

If we trace back the history of almost any nation, we shall find it originating in the savage or hunter state, in which man wages continual war with savage beasts, and men more savage still; and lives in a state of perpetual alarm or aggression, without any regular means of support; sometimes gorged with his prey, but more frequently pinched with hunger; without natural affection; and destroying his aged parents and helpless infants when they become burthensome to him.

In the first stage towards civilization, we find families and tribes of wandering shepherds, without any fixed habitation or bounds of landed property; without any law but force; among whom bread is a luxury, and wine unknown; who are ignorant of almost all the arts and sciences; and strangers to most of those enjoyments which make life desirable.

Let the visionary sophist who delights to wage war against common sense; let the fantastic poet whose food is fiction, enlarge the hunter and the shepherd state, as the gold and silver ages of the world; Though we may be amused with the ingenuity of arguments which do not convince us, and pleased with brilliant, but false coloring, which does not deceive us; and though we do not feel uneasy at encomiums on characters which we do not envy, yet the generality of mankind allow, that we are never happy until the "bounds of our habitation" are established by known laws, and we return to the employment of our first parents in Paradise.

We have not time to compare the pursuit of agriculture with those occupations, which necessity or ambition induce others to embrace; but to prove its superiority, we refer to the practice of the most enlightened nations, in which we find a great majority of the people actually engaged in husbandry; and those who have been prevented by necessity, real or imaginary, fly to it as soon as they have obtained a competency; and if it be not so generally the case with the ambitious, it is because ambition is more insatiable than avarice.

What occupation is so healthy, so innocent, so delightful, so truly honorable, so independent on man, so dependent on God?—What so productive of national wealth, population, military strength, general knowledge, equal fortunes, steady habits, and all the essentials of republican government? If it is not so productive of individual wealth it is because it has so many other attractions which induce many to enter on it, who are willing to give up a greater profit, for the sake of more valuable considerations:

and because the happy circumstances of this section of our country, (where the hardy yeoman tills his own soil with his own hands, and where slave and peasant are equally unknown,) do not permit any great extension of agricultural capital. Nevertheless, as far as my own experience goes, I am bold to assert, that investments in agriculture have of late years been more productive, than capital employed in commerce; and it is to be doubted, whether manufactories have been more profitable.—How thankful then ought we to be, that the great Disposer of events has suited the occupation of the bulk of mankind so kindly to their natures! What reason have we not to exclaim, like the Mantuan bard, *O happy farmers, did we but know our happiness!*

But agriculture is a science to be studied, and husbandry is an art to be learned. As well may we expect to be able merchants, or expert mariners, without diligent application to the necessary studies, as to be successful farmers, while we wholly neglect the theory and but negligently attend to the practice of Agriculture. Our mistakes are not so immediately obvious, as those of the merchant and shipmaster; for happily we may sleep away the night, reckless of protested bills or latent rocks; but the effect of our errors is no less certain in the end. View the snug and comfortable mansion, surrounded by well filled barns and durable fences; the abode of plenty, peace, and happiness; and contrast it with that slab covered hovel, where old hats and rags outnumber the panes of shingles and broken glass; the abode of want, discord, and misery; surrounded by fenceless fields, and a doorless barn. The masters of both these tenements, came together into this State; each with an axe on his shoulder, but not a cent in his pocket; equal in health and bodily strength and laborious habits, and in advantages of soil; but unequal in discernment and knowledge.—The one has already paid for his farm, and settled many of his children: while the other owes twice as much as when he felled the first tree; and is in a manner the servant of his richer neighbor, for "knowledge is power."

Nor is the advantage of agricultural knowledge more obvious in individuals, than in nations. Look at the land of our forefathers, whose princes and nobles have delighted in the cultivation of the soil; and whose late monarch was one of the most able and successful farmers in his kingdom. Contemplate their Board of Agriculture, their Agricultural Societies, their Agricultural Surveys, their periodical Agricultural Publications, their expeditions to every quarter of the globe in search after unknown or untried plants. See their philosophers aiding and emulating their statesmen, and adapting chemistry and other sciences to the purposes of rural economy. Think of their exploring the bowels of the earth for minerals, to add verdure to the surface—of their draining morasses and irrigating hills—now boring their drains, like moles under ground—and then heaping the top soil into ridges and beds—and not only cleansing their cities to fatten their fields—but, for manure, importing from the continent whole cargoes of bones, many of them doubtless human—so that perhaps ere long, the myriads that fell at Waterloo, may sprout up like the army of Cadmus, on British fields, and give bread to their conquerors.

Nor has the result been unequal to the pains but has exceeded the most sanguine expectations. The progress of England in agricultural knowledge has been so rapid, that the productions of the soil are more than quadruple what they were under the boasted reign of Elizabeth—and very far exceed the produce of her gigantic commerce, her innumerable manufactures, her fathomless mines, and her productive fisheries, all added together.*

Now for a contrast: turn your eyes to a sister kingdom, a neighboring island, blessed with as good a soil and climate. But the proprietors of the land have neglected its cultivation, while they have been rioting on luxuries abroad.—Her peasantry have been uninstructed and undirected; each one tilling a few acres of ground, instead of many laboring under the direction of one intelligent man, as in England.—I spare you the disgusting detail of the consequences; but you cannot be ignorant of the fact, that thousands of Irish peasants have this very last summer died of absolute starvation; while the granaries of the English farmers have been overflowing, so that they have not had where to bestow their goods; and this, without any very unusual failure in one country, or abundance in the other. I grant that much of this distress is owing to political oppression; but it is more owing to the low state of agricultural knowledge, and the neglect of rural economy.

Yet, Gentlemen, do not think, that, though the *English farmer* pays a rent greater than the average fee simple of our farms, and a burthensome tax, and oppressive tithes, and higher wages of labor, than any other farmers in Europe, and yet often acquires a princely fortune; that therefore I would hold up his practice, as an example for us blindly to follow. By no means. The circumstances of the two countries being very different, the practice must be as different. Though from him we may learn the great utility of agricultural knowledge, and the general theory of husbandry: Our practice must conform to our circumstances; and it is in very few instances of detail, that we can successfully imitate his. Circumscribed by the ocean, and abounding in population, the rent of their land is necessarily high; and when compared with ours, the wages of their labor is proportionably low; while we are bounded by endless forests and possess extensive tracts of the finest soil the world can boast of; our population is thin, our labor high, and our land cheap; the crop often costing more than the field it grows on, and worth double its value. It is obvious therefore, that in England, the cost and consequent price of an agricultural commodity, must chiefly depend on the rent of land; as more is paid for rent than for labor. But in this country the cost must chiefly depend on the price of labor; as more is paid for labor than rent; rent, labor, and profit of stock, making in all countries the whole cost of an article. For these reasons, articles which require much labor, are cheaper in England than here; and practices which are

* Notwithstanding the destructive wars in which G. Britain has lately been engaged, her population has increased in 20 years, (viz. from 1800 to 1820) not less than three and a half millions. Horses and other useful animals have also so much increased, that some individual carriers now own more horses, than Queen Elizabeth could muster, when in danger of invasion from the Spanish armada. This amazing increase can only be attributed to improvements in agriculture.

beneficial there, are unprofitable here; their object being to save rent, ours to save labor. It does not so much concern us to know how much we can get from an acre, where land is so cheap, as how much we can get for a day's work where labor is so dear. The farmer has much more need than the merchant, to keep a profit and loss account, in all his transactions; and it is chiefly for want of it that many young and theoretic farmers find agriculture unprofitable, and many of the old and experienced never abandon the habits of their ancestors, however injurious.—But no wise man will implicitly adopt the opinion of another, if he can readily test its truth by his own experience.

Though the great principles of agriculture must remain immutable, so long as God shall please to uphold the present order of nature; yet it must be obvious, that our local situation renders the practical knowledge of others of but little use to us. It is necessary that we should make experiments for ourselves, and accurately ascertain those facts, which suit our particular situation.—We should ascertain, for instance, whether we have any natural manures which we can profitably apply to our lands; whether our lime be of a salutary or injurious quality; to what soil it is suitable, and to what prejudicial; in what quantities it should be used;—whether we have marl or other like substances; what soils are most in want of plaister, sand, gravel, clay, (raw or burnt,) swamp muck, eat-ashes, &c.: whether compost or raw manures be in the end most profitable; in what circumstances surface and under ground draining and irrigation, will pay the expense; whether woad, madder, and other dyeing drugs; as well as new roots, grains and grasses, will pay the expense of cultivation; which breed of horned cattle are most inclined to fat, which milk, and which is best for labor.

We want to know the comparative merit of the different breeds of horses, sheep, and hogs; the comparative value of succulent roots, rains, grasses, and esculent vegetables; and in thousand other things. Now though we may get much light on these subjects from foreign publications, yet we ought to know them from our own actual experiments: for though the great Sir Humphrey Davy, and the French chemists, have ably analyzed most of the subjects of the mineral and vegetable kingdoms; yet it sometimes happens, that from some unknown cause, actual experiments in agriculture, do not exactly agree with the chemical theory, and therefore experience must be the only true guide. This experience we want; and this is the object of our society.

But how shall this great and important object be obtained? Shall we trust it to the unconnected exertions of insulated individuals? True, there have been many who have given to the subject, a great part of their time and talents, and are worthy the respect and homage of mankind; for the man who adds to our productions one new plant; to our manures one new article; who corrects one error, or invents one machine, by which the labor now performed by rational beings may be transferred to the brute creation and the elements; confers a greater benefit on his race, than all the conquerors who have manured the world with blood, from Nimrod to Napoleon. When they shall cease to honor their destroyers, and shall be grateful to their benefactors, the name

of many a rural Socrates shall be rescued from obscurity; while the name of those scourges of mankind, shall rot in oblivion, or only be remembered to be execrated.

“Oh! spring to light, auspicious day,”

when the instruments of war shall be converted into the implements of husbandry, and mankind shall form one great agricultural society. But the joyful anticipation of that glorious period, which certainly and perhaps soon will arrive, has hurried me from my subject.—I ask again; shall we trust the interests of agriculture and its improvement, to individual exertion? Let us remember that though the duration of man's life, may be sufficient for the conquest of the world, it is not long enough for the acquisition of the art of husbandry: and in our present situation we have hardly any means whereby the experience of one may benefit another or descend to posterity. Now, when a man dies, his knowledge and experience die with him; and all he leaves as a memorial, is his example in a narrow circle, and his well cultivated farm; which in one or two generations degenerates to the common level. Search now, and see, if you can find, the farm of Cincinnatus, or of Cato the censor. Alas! the same tide of war has overwhelmed and swept away, as “with the besom of destruction,” both the Cotage of Virgil and the Villa of Cicero. In vain do we expect great improvement to be derived from the labors of solitary individuals; but were we as desirous of imitating the example of Frederic of Prussia, in his exertions to promote the agricultural interests of his kingdom, as we are to admire his military fame; it would be to our advantage. He deserves to be called *Great*, not because he wasted the fields of other kingdoms, but because he improved his own; not because he improved military tactics, but because he founded a professorship of rural economy at his university of Halle. We have indeed a grand national academy in which our youth are instructed in the art of making widows and orphans; but we have no academy where they may learn to make their country great and happy by the successful cultivation of the soil. Could it be, that each of our states would endow a professorship of agriculture and the useful art, in one of their Colleges, with a farm carried on at the public expense and for the public benefit; it would be perhaps the best way to acquire and disseminate this agricultural knowledge. Some of our universities have already a botanic garden; may we not hope, that, in time, they may enlarge their sphere.

The next best, and indeed the only other feasible plan, for the improvement of agricultural knowledge, is the establishment of *Agricultural Societies*. What is impossible for individuals, may be practicable by associations. The immense benefit they have been to all countries where they have for any length of time been established, is too apparent to be dwelt on. The great improvement of England is chiefly owing to her societies. Hardly one of the United States is without one. The most enlightened of our citizens give them their support. Our farmers, generally circumscribed in their means, are not able to make expensive experiments, and are not much given to innovation; nor is it perfectly fair that one man should be at the whole expense, and the

whole community reap the benefit. It is therefore necessary, that some means should be used to stimulate our agriculturalists to make experiments; and to induce them by pecuniary and honorary rewards, to make known the results. For this purpose we have assembled this day, where we can view the most excellent of the productions of the soil, decide on their merits and rewards, and learn the manner in which they were produced; that returning home, we may practice the same, and make it known to our neighbors.

But some assert that many of the objects of the Society appear to them frivolous and unprofitable. So did to others the introduction of the potatoe, the turnip and the carrot, which have made so great a revolution in the agriculture of England.—So now perhaps appears, to some, the introduction of the ruta-baga, mangel-wurtzel, woad, madder, and merino sheep. But I answer, that if we succeed in but one object in a hundred, which we undertake, it may be worth to the commonwealth a hundred times all our expense and labor. We most of us remember when the cotton-plant was a stranger in the United States—now it produces one of our greatest articles of export. Rice was thrown on our shores by the wreck of a vessel from Africa, and first planted by the floods; and indigo, perhaps, was introduced in some way as precarious; and the time may come when the wool, grain and woad of Maine, may rival the cotton, rice and indigo of Georgia; and even the cultivation of the tea-plant in this, or some more southern State, may save our silver from being sent to the ends of the earth, for that article of luxury.

But our opponents object, that they do not see the effect of our exertions. Do they expect to reap the crop, as soon as the seed is sown? Changes in agriculture are not made in a day. It is but a few years that we have existed; and in that short time, much agricultural knowledge has been disseminated and turned to actual account. Our breeds of horses and other stock have been improved; new articles of agriculture have been introduced; and threshing machines have been invented, which bid fair to rival the cotton-gin in utility; and we hope soon to present a machine which will so assist the farmer in the preparation of hemp and flax, that we shall have no further need of importations of those articles from Russia.

True, we have not done as much as we wish, or expect to do;—but our means are scanty, while our object is great. We have been disappointed in the support and countenance we expected from the State government. For, since we have become independent of old Massachusetts, we seem to have thrown off the influence of her good example; and Maine alone, I believe, of all the Northern States, and perhaps of all the States in the Union, gives no support to Agricultural Societies. Commerce must have its navy, its ambassadors, and its consuls; manufactures, their protecting duties; and the military art its public school, while agriculture, the support of all others, is left to the encouragement of the State governments; and the government of our State neglects it. Do our legislators think that we know enough already; or that we are too stupid to learn; or that the soil of Maine is not worth cultivating? Or are we too poor to give any

support to Agricultural Societies? Give us but one hundredth part of the annual expenses of military parade, and we shall be satisfied. May we not hope, that future legislators may be more enlightened, and more careful of the best interests of their constituents?—But if otherwise, gentlemen, let us remember that the less is done for us, the more we must do for ourselves; and should we be without the assistance, or even thanks of that public, for whose benefit we are laboring; let us nevertheless increase our exertions, and reap the reward in our own bosoms.*

* The Legislature of New York with its accustomed wisdom and liberality, has established a *Board of Agriculture*, which does by authority what the State Agricultural Society of Maine has attempted to do by voluntary exertions. This Board is authorized to expend on certain conditions \$10,155 annually in premiums, &c. \$1000 annually in seeds and other necessary expenses, and about \$1000 in publishing annually a volume of memoirs on agricultural subjects—in all \$12,175 annually; besides a sum of \$500 given for the foundation of an agricultural library. This is done in a state with about four times our population, while our State has refused a single dollar for aiding any agricultural purposes whatever. [See *Acts of the New-York Legislature for 1819 and 1820, which are in force six years.*]

From the Boston Daily Advertiser.

AGRICULTURAL INTELLIGENCE.

Dr. T. W. Harris, of Milton, son of the Rev. Dr. Harris, of Dorchester, has turned his attention to the Caterpillar, which has been so destructive to the salt marshes in this vicinity for many years past, and has made a communication on that subject to the Massachusetts Society for promoting Agriculture, which was so satisfactory to them, as well on account of the importance of the subject, as the careful, and judicious, and accurate manner in which the investigation was conducted, that the Trustees voted to publish the essay, and to grant to Dr. Harris the Society's gold medal of the value of thirty dollars. We shall not attempt an analysis of his essay, as it will appear at large in the *Journal of the Society*, in June next. The first appearance of the perfect insect, the moth, Dr. Harris states to be from the 1st to the 20th of June; and the Caterpillars attain their greatest size about the 1st of August. The most important points of his communication to practical farmers, who have suffered so severely from this scourge, are the preventive remedies, which seemed to the Trustees so important, as to require an immediate notice, in order, that attempts might be made during the ensuing season, before the publication of their next number. The sowing of one crop of salt hay would be of great importance to the country bordering on the ocean. I was therefore instructed to pay this just tribute to the zeal and industry of Dr. Harris, and to publish the following recommendations suggested by him for the destruction, (or at least with the hope of checking the ravages,) of this insect. Dr. Harris says,

“From observation, and experience, I would recommend the following plan, by which we may lessen the evils we suffer from this enemy.

“First to cut the grass early in July—and secondly to burn over the marshes in March.

“In defence of early mowing, it may be said, that it is the only way by which the crop may be saved from those meadows where the cater-

pillars have multiplied to an extent. The preceding history furnishes the data from which to calculate the best time for effecting this purpose.

“We have seen that the Caterpillar is hatched about the 20th of June, and that its ravages are continued seven weeks. If then the meadows, in our vicinity, are mowed about the 1th of July, the Caterpillars, being small and feeble, will be deprived of their means of nourishment, and being unable to wander far, will die before the crop is gathered in. By the process of making the hay most of the succulent juices are evaporated, and the hay becomes so dry and hard as to resist the efforts of these little devourers. Thus we see the black grass (the most valuable) by ripening early is rejected by them, and the crop is saved.

“By the practice of late mowing, where the Caterpillars prevail, the crop is diminished, immense numbers of Caterpillars and of Grasshoppers are left to be dispersed upon the uplands to multiply and increase the existing evil; or are brought in to perish in our barns and stacks, where they communicate a most unpleasant flavor to the hay, rendering it unpalatable to our cattle, and occasioning a waste of fodder. Many beneficial effects result from burning over our marshes in March. This has been long practised in New Brunswick, a British province, abounding in salt marshes, and is getting into use with us, to the manifest improvement of the crops. By it, “old fog” is consumed, which becomes more important from early mowing the preceding year. By this means also we destroy innumerable eggs of Caterpillars and Grasshoppers laid in the grass the last autumn, and which, if hatched, produce a great increase of our devouring enemies.

“The roots of the grass are not injured by burning the stubble; on the contrary, they are fertilized by the ashes.”

Such are the simple, intelligible, and rational suggestions of Dr. Harris—so simple and so rational, and so easy of execution, that we should hope that many, if not all owners of salt marshes, so infested, will be induced to try them. They need not reject the suggestion, because it may be said to savour of *book farming*, nor need they fear the ridicule which is attempted to be thrown, by one of our brother farmers in the western counties, on “gentlemen farmers,” of which he himself happens to be one of the newest recruits. Truth may come from scientific research. The improvements which have been made in other arts and other sciences, have been chiefly derived from these sources, and we hope Agriculture is not yet prepared to reject the aid of Science, nor to disclaim the efforts which have been made by such men as Washington, Jefferson, Sinclair, Davy, and a thousand others, although they may have been facetiously called “gentlemen farmers.” Per order

J. LOWELL, Corresponding
Sec'y Mass. Ag. Society.

From the Newburyport Herald of Tuesday.

The meeting of the *Essex Agricultural Society* took place at Hamilton yesterday according to appointment of the Trustees.—The meeting was very poorly attended from this part of the county; but one gentleman present has oblig-

ingly furnished us with an account of the proceedings of the Society.

The following gentlemen were chosen officers for the ensuing year, to wit:

PRESIDENT.

Hon. Timothy Pickering, Salem.

VICE PRESIDENTS.

John Heard, Ipswich, Ichabod Tucker, Salem,
Dr. Benj. Parker, Bradford, Joshua Carter, Newbury.

TREASURER.

Benjamin R. Nichols, Salem.

COR. & REC. SECRETARY.

John W. Proctor, Danvers.

TRUSTEES.

Isa Andrews, Ipswich; William Pierce, Gloucester; Hubert Clark, Andover; Paul Kent, Newbury; David Emory, do.; Aaron Perley, Boxford; Daniel Putnam, Danvers; Temple Cutler, Hamilton; Israel Foster, Manchester; Thomas Stephens, Beverly; Edmund Bartlett, Newburyport; John Adams, Andover; Daniel Adams, Newbury; James Gardner, Lynn; Elihu Chaplin, Newbury; Ephraim Wildes, Topsfield; Daniel Fuller, Middleton; Nathan Felton, Danvers; William Reed, Marblehead; Jesse Putnam, Danvers; Moses Newell, West Newbury; Benjamin W. Crowinshield, Salem; J. W. Duncan, Haverhill; David Cummings, Salem.

It was resolved to amend the constitution so that there shall be but one stated meeting annually, at which the officers of the society shall be chosen, and all other matters requiring the agency of the Society, shall be transacted, and the stated meeting shall be in autumn, the time and place of the public Exhibition.

It was also voted on account of the state of the funds of the Society, to omit the next regular Exhibition.

According to this arrangement there will be a meeting of the Society in October next (the place to be appointed by the Trustees) for the transaction of business, choice of officers, &c. but no Exhibition.

THE FARMER.

BOSTON:—SATURDAY, FEB. 22, 1823.

COMPLETE FILES OF THE N. E. FARMER.

The Subscribers and Patrons of the *New England Farmer* are respectfully informed, that the Proprietor having reprinted a number of the first impressions of his paper, complete sets, from its commencement to August last, may now be had, by application at the Farmer Office, Rogers' Buildings, Congress Street.

Those who may be disposed to subscribe, will find an advantage in taking the papers from the commencement. They are printed in a form convenient for binding into a book—are pagged—and at the end of a year from the date of the first number, a title page and index will be furnished gratis to those who take the whole volume. Besides, many of the Essays are continued from one number to another, and may be read to greater advantage by having the whole complete.

If any of our subscribers have not received all the numbers, they will be so good as to forward information of those which are missing, and they shall be sent according to directions.

We hope that Mr. Ladd's Address, together with the valuable original communications which we bear the honor this day to present to our readers, will render our paper acceptable without the usual quantity of editorial matter. We know that it is rather of grave cast, and not quite so amusing as a romance, or a jest book, or one of Mr. Mathews' comic exhibitions. But we are more solicitous to profit than to amuse our customers; and though we may now and then give

anecdote, or a merry article, to season our solid dishes. Let the mass of our matter must of necessity be of that kind of fare which to many literary palates will be dry and insipid. Although it has been already hinted to us that a little more comic spice, attic salt, and other literary condiments is wanted to give our paper a relish among the gay, the polite, the airy, and the fashionable, we cannot sacrifice the substantial for the volatile, or get for a moment that utility is our main object, and that a recipe which may be of value in domestic economy is of more importance than an anecdote which will be read with a broad grin and forgotten.

There is a species of mental dissipation, which is scarcely less dangerous, because more insidious, than that which leads a man to the tavern, or even that which leads him to be dreaded, which allures him to solitary rpling. The kind of dissipation to which we allude prevents a person's being able to fix a moment's attention on any thing really worth attending to. The victim of this frailty wants nothing but light articles, pretty paragraphs, neatly turned, with most elegant phraseology, but—signifying nothing. Those persons who give way to this weakness, have not patience enough to read a whole column in a paper devoted to useful topics, or to trace truth through every tortuous train of reasoning. They are satisfied with what lies on the surface, and are therefore well denominated superficial characters. To ladies and gentlemen of this description, we beg leave to observe that the highest compliment they can bestow upon our paper, would be some expression of their disapprobation. We will all be pretty sure of the approval of the *wise*, if we did we are honored with the censure of the *otherwise*. We would not, however, be understood to be inimical to wit, anecdote, or innocent hilarity, properly introduced, and relating to proper subjects. But the literary taste which can be pleased with nothing but the wonderful or the ludicrous, tales of terror, or corruscations of wit, is as much depraved as the palate which can be satisfied with nothing but honey and spices.

TO CORRESPONDENTS.

We have been requested to republish certain articles, and furnish information upon various topics connected with agriculture in several of its branches. We will all comply with these solicitations as far and as fast as possible. We hope in our next to give an article on the best mode of reclaiming land from the sea, draining salt marshes, &c. We shall soon republish some articles on improving the breeds of cattle, from the American Farmer. Some other subjects, to which our attention has been turned by request, are not forgotten, but merely deferred for the sake of availing ourselves of time to consider, and means to investigate the topics we are requested to discuss.

FARMER SUMMARY OF NEWS.

CONGRESS.—Nothing of great moment appears to be going on at Washington in the halls of legislation. Mr. Mercer presented a resolution, authorizing and requesting the President to open negotiations with European powers for the abolition of the slave trade, and the denunciation as piracy by the civilized world.—The New Tariff bill is yet on the legislative anvil, and whether it will assume any permanent and current shape this season is a matter of doubt.

FOREIGN.—Papers from Calcutta have been received by a late arrival at Salem, as late as the 9th of November. Many parts of India have suffered by storms and inundations. Whole villages have been destroyed, and three fourths of the city of Surat were overwhelmed with water; a great number of cattle, and about one thousand houses were swept entirely away. In the city of Boorhanpore, 2000 houses were destroyed, and a great number more damaged. The

river Verbuld rose thirty feet above its ordinary level in thirty-six hours, and inundated a region of two hundred miles in extent—sweeping men, cattle, and the products of the earth to one common destruction.

Advices from Mexico as late as Dec. 28th, have been received at New York. By these we learn that the Emperor Iturbide having determined to capture the castle of St. Johns, had made some movements for that purpose; but his progress was arrested by the republican army, under Generals Lopez and Victoria, and several hundred of his men have deserted him and fled to the republican standard.

The great question of peace or war between France and Spain was not decided at the date of our last intelligence from Europe. The King of France, if not inclined to peace, seems, at least, not disposed to be in a hurry in his appeal to arms. The Duke of Montmorency, being vexed at the pacific or cautious policy of his Majesty, resigned his office of Minister, and his resignation appears to have been cordially accepted. A note, however, has been sent to the French Minister at Madrid, the Count De La Garde, directing him to inform the Spanish government that the government of France is "intimately united with its allies in the firm resolution to repel, by every means, revolutionary principles and movements," &c. The Russian Minister, M. Pozzo de Borgo, is said to have raised his voice for war, and to be very indignant because the French Manifesto is not more peremptory and warlike. Spain, however, does not appear to be intimidated, but is making every exertion to repel force by force.

Pirates continue their depredations on American commerce. Capt. Davis, commander of the ship Essex, from Gloucester, was chased and plundered by them. His vessel and cargo were condemned in a mock trial, as a good prize to the pirates. The brig Adeline, Capt. Kempton, of Boston, has been sent into Porto Rico by those plunderers, and condemned as their lawful prize.

A new steam vessel is said to be preparing on the Thames, and is intended for Calcutta. Her engine and boiler occupy only one fifth of the usual space. The furnace consumes its own smoke; and will perform with one bushel, what formerly took one chaldron of coals; her boiler is so constructed as to return its own steam, without one particle escaping, so that when once filled, it is enough for the voyage, which it is calculated she will perform in 30 or 40 days. Our famous countryman PERKINS is the inventor.

DOMESTIC.—Commodore Porter's squadron against the pirates is said to be ready to commence its operations, and, says the Norfolk Herald, "it is devoutly to be wished that the sword drawn in this righteous cause may not be returned to its scabbard until the just mandate of the nation to 'exterminate the pirate throng' shall be fully executed."

A cotton and woollen manufactory at Meredith, N. H. owned by Mr. D. Avery, was burnt on the 12th inst.—Seven young women were in an upper story at the time, and being precluded other means of escape, six of them leaped from the windows, a distance of about 30 feet, and were all severely injured. The other was taken from a small window, by means of a ladder, almost suffocated. Loss estimated at from 25 to 30,000 dollars—of which only \$4000 were insured.

The Saratoga Sentinel states that the *Small Pox* is raging to an alarming degree at Stillwater (N. Y.) and is supposed to have reached some of the adjoining towns. A general inoculation of the kind pox, among those who are liable to receive the small pox, is said to be going forward.

The house of Mr. John Kaufman, in York, Pa. was lately entered by three robbers, who tied the man, and ransacked his premises for plunder, but found only about ten dollars, and a silver watch, with which they made off—without discovering 1000 dollars in specie, which Mr. K. the next day lodged in York bank.

A correspondent of the N. Y. Commercial Advertiser, at Washington, under date of February 9, writes, that Langdon Cheever, Esq. and a gentleman from N. Carolina, had been nominated Commissioners, under the late convention to settle claims relative to slaves taken away by the British, at the close of the late war.

A splendid dinner was given to Commodore Porter, at Norfolk, a few days since. Captain Warrington presided, assisted by captains Finch and Grayson, as Vice Presidents.

Stephen Girard, Esq. of Phila. has lent of \$200,000 to the president and managers of the Schuylkill Navigation Company, for the purpose of completing certain contemplated improvements in the navigation on the river Schuylkill.

Three men, near Greenshush, Penn. being employed in boring the earth for salt water, a flame burst from the well and burnt them so badly that their lives were considered to be in danger.

A Moor, by the name of Garrow, lately died at Georgetown, Columbia, aged 155 years.

A number of cattle, swine, and one horse, have lately died, suddenly, on Long Island, supposed of Hydrophobia. A black girl has also been bitten.

A bull, two years old last April, raised by Parius Matthewson, Esq. of Pomfret, Conn. was slaughtered on the 28th ult. the weight of which, says a correspondent of the New London Advocate, was as follows:—Hind quarters 362—fore quarters 464—hide 133—tallow 48. Total 1022 lbs.

Canals.—A petition has been presented to the Legislature of Pennsylvania, by sundry inhabitants of the western part of that State, stating the practicability of connecting the waters of Lake Erie with that of Ohio river, by cutting a Canal of 4 miles from the creek Ashtabula to the Shenango, in Crawford county, and praying that a company may be incorporated with a capital of \$15,000, for the purpose of making said Canal.

BY T. G. FESSENDEN.

"A merry heart doeth good like a medicine."

With mirth let us cherish our hearts.

'Tis a precept by Solomon given,

And cheerfulness surely imparts

The temper best fitted for heaven.

Among all the numberless ways

By which folly contrives to be wrong,

There is none which more weakness displays

Than wearing a visage too long.

Th' Omnipotent Donor designs

That the gifts of His grace be enjoy'd;

Hence, he that forever repines,

Had better be better employ'd.

When first was created our race,

This earth for man's mansion was giv'n,

And shall he find fault with the place

To which he's allotted by heav'n?

'Tis a thing, I believe, understood,

In which every sect is agreed,

This earth was declar'd to be good,

And so in the Bible we read.

Under Providence, tenants at will.

A fine habitation we hold;

For us to be murmuring still

Is wicked, ungrateful and bold.

Yet well-meaning people I've seen,

Who think true religion is shown

By a sort of a woe-begone mein,

And a whining, conventicle tone.

'Tis true, there's a season to mourn,

As Solomon says—nevertheless

Our griefs should be manfully borne,

And 'tis folly to cherish distress.

A train of diseases await

On a heart that forever is sad,

And some, from a sorrowing state,

Become irretrievably mad.

That religion can never be true,

Which bows its disciples to earth;

For he that has heav'n in his view,

Has the best of all titles to mirth.

With mirth then we'll cherish our hearts,

'Tis a mandate by Solomon given.

For cheerfulness surely imparts

The temper best fitted for heaven.

SELECTED FOR THE NEW ENGLAND FARMER.

A man of science can do greater things in his closet than a general at the head of an army, or a king with the physical force of a nation at his control.

Men of bustle are not men of business.—There is a kind of men who may be classed under the name of *bustlers*, whose *business* keeps them in constant motion, but whose motion *always eludes their business*. They never can stand still, because they are wanted in some other place, and are wanted in many places because they can stay in none.

There is an old maxim "Take care of the pence, and the pounds will take care of themselves." But there are some who save pence and throw away pounds. They will higgie with a huckster half an hour for half a cent, and yet squander away thousands of dollars in vain parade. Such men, and women too, are truly "penny wise and pound foolish."

Terrify and teaze no person, not even your most intimate friends, by false reports, vexatious jokes, or any thing which can give them a moment's uneasiness. There are unpleasant realities enough in this world, without adding unnecessary and imaginary evils.

Pleasure is very seldom found where it is sought. Our brightest blazes of gladness are commonly kindled by unexpected sparks. The flowers that scatter the sweetest odours in the path of life, generally grow without culture, from seeds sown by chance.

Plato has very sagaciously observed, "that of all the shipwrecks in which the human understanding is liable on the sea of ratiocination, the most common is that of splitting on the rock of false comparison, or similitudes."

A noted tippler was asked if he would drink a gill of rum, mixed in any manner that might be prescribed? He agreed to swallow it. It was then mixed with a gallon of water, which he soon drunk for the sake of the spirit. We are frequently reminded of this, when we hear a man speak a long time to deliver an idea which might be conveyed in a few words.

February.—This is a cold short month of short days; yet it must not pass unimproved. Farmers should not be idle, though they can neither sow nor reap. Your horses, cattle, sheep and hogs, demand unwearied attention. Do not trust the boys to see wholly to them. Care should be taken that they are all fed and watered in proper season. Do not lie in bed too late and keep them from their morning meal; nor stay at the tavern or store till a late hour, and keep them from their evening allowance. Dry stables will save much hay. Now draw you a large woodpile, and thrash your grain before the vermin devour it. How go your schools? Parents should visit them often, and encourage their children; and in these long evenings hear them recite at home. Take up, too, some useful paper; or Rollin's, Mosheim's, or Milner's history.—*Christian Almanack.*

Important Improvement in Surgery.—The formidable operation of Lithotomy (or the extraction of *Urinary Calculi*) is now reduced to a degree of simplicity, almost incredible, by an invention of W. W. Sleights, Esq. M. R. C. S. L. and Lecturer in this City, on Anatomy, Physiology and Surgery. We omit mentioning particulars, except the following prominent features in it, viz. that the skin is not touched with a knife; that the *actual* operation does not occupy the eighth of a minute; and that it is attended with little if any more danger or pain, than *bleeding in the arm*. Thus an operation considered by the most celebrated men of the day, as fraught with the most eminent peril, and excruciating suffering, will be rendered as simple as *venesection*. We further learn, that the operation as *originally* conceived by him, was liable to many difficulties, all which have been effectually obviated by certain measures devised by him during the last twelve months consideration of the subject, and without it cannot be undertaken with safety. The Doctor, has as yet communicated these means to no one; but a treatise will

soon be published in London, to which City, we understand, he purposes, in the course of the next summer, proceeding.

We have seen a stone the doctor extracted on the 18th inst.; it weighs (independently numerous fragments,) *seven hundred and ninety eight grains*; and its circumference measured two opposite directions, five inches. The patient was well on the third day.

Montreal paper.

On the 12th of November, a farmer's wife of the name of Weischwall, at Wilkischken, Prussia, poisoned, with arsenic, her daughter, a girl of about 15 years of age, for fear she would make it known that her mother stole some geese. After the crime was discovered, she confessed that, two years ago she despatched her father-in-law in the same manner, to inherit the property sooner; and, five months ago the husband of her eldest daughter, in order to marry her to a richer man.

A certain great man, whose purse was somewhat better furnished than his noddle, employed some workmen to empty a fish pond—when one of them told him that he had found a *petrification*, [a piece of wood changed to the appearance of stone.] "Have you," said his wise employer, "then put it among the rest of the fish."

A Fat Story.—A certain man who was famous for the use of certain figures in rhetoric, called hyperboles, or by some *white lies*, said that he knew a Mr. such an one, who by idleness and high living, at length became so fat, and so heavy, that he would shake an upright two store house, by walking on the bottom of the cellar under it!

A certain farmer once complaining to a neighbor of his turnips, which had large tops but small roots, said that they were precise like the *infernal regions*. "Why so?" said his friend. Because, replied the farmer, they are *bottomless*.

Unfortunate Case.—A zealous Priest in the north of Ireland, missed a constant auditor from his congregation, in which schism had already made depredations. "What keeps our friend farmer B—, away from us?" was the anxious question proposed by our vigilant Minister to his assistant. "I have not seen him among us," continued he, "these three weeks: I hope it is not Protestantism that keeps him away."—"No," was the reply, "It is worse than that—" "Worse than Protestantism? God forbid, should be Deism." "No, worse than that."—"Worse than Deism! good heavens, I trust it is not Atheism!" "No, worse than Atheism!"—"Impossible, nothing can be worse than Atheism!" "Yes it is, your honor—It is *Rheumatism*."

A Quaker at Norwich (Eng.) having bought a horse which proved unsound, of a gentleman named Bacon, he wrote to inform him of it, but received no answer. Shortly after, meeting the seller at Norwich, he requested him to take back the horse, which the other positively refused to do. Finding his remonstrances of no avail, the Quaker calmly said, "Friend! thou hast doubtless heard of the devil entering the herd of swine, and I find he still sticks in the Bacon. Good morning to thee, friend."

No. 31.

ON EMBANKMENTS, DIKES, DRAINS, &c. FOR THE PURPOSE OF RECLAIMING LANDS FROM THE SEA, RIVERS, &c.

BY THE EDITOR.

Having been requested by some respectable correspondents to furnish such information as might be at our command, on the abovementioned subjects, we proceed to lay before our readers the result of our researches. We would premise, however, that we have no knowledge on this topic, derived from experience, and that books are the sources from which we have deduced nearly all which we shall venture to suggest.

The first object to be considered, before attempting to reclaim land, that at low water is left uncovered by the sea, is, whether or not the quality of the surface to be gained, is such as to be capable of profitable cultivation. In many cases, what is exposed at low water, and might easily be banked out, is an accumulation, to a great depth, of barren sand or gravel. But there are other places, where the sea, at low water, recedes so far, as to leave dry, large portions of surface, which is composed of a deposition of fine earth washed down from higher land.

Embanking, so as to exclude the sea, is more or less expensive, according to the nature of the materials of which the beach is composed. If the soil is of a sandy nature, it is generally necessary to face it with stone on the side next to the sea; otherwise the waves would soon make breaches in it. It is also necessary to give it a very considerable slope, and, at the foundation, to have the stones bedded, and laid in such a way that they may bind well together. The height of the embankment, should, in all cases, be at least two feet more than that of the highest tide.

When the materials of which the bank is formed are of a clayey or adhesive nature, strong turf may answer the purpose of facing the bank, and these should be well beaten and pinned down as soon as laid. The inside or land side slope should also be faced with turf.

If turf is to be used in covering the outside slope it must all be laid with the grass uppermost, and well beaten down with a flat sod-beetle, made for that purpose; and for their better security, it may be proper to drive a small stake of about 18 inches long, or more, through every sod. The sods for this purpose, should at first be carefully taken up, and traced by a line, all of the same breadth, and their edges cut as even as possible, that they may make the closer joints.

An American writer on this subject, (whose observations may be seen at length in the American Farmer, vol. ii, p. 131,) in treating of the difficulties which occur in reclaiming marsh lands, says that they arise "chiefly because of their exposure on the sea coast to severe gales of wind, and high spring tides. In a great measure to the spongy, light nature of the marsh land, it being in a degree composed of the roots of rushes and marsh grass. Likewise from want of attention in yearly repairing and raising the banks, which settle and contract very much as

the roots decay; the mud also, by drying, moulders into a fine dust and is blown away by every high wind. They who succeed best, have a sufficient space between the edge of the river or the creek and the bank, to save it as much as possible from being washed by the spring tides, or undermined by the encroachments of the river or creek. They form the bank by earth taken altogether from within it, and leave no ditch between the bank and the creek or river. They likewise leave a considerable margin between the bank and the ditch formed by digging out the earth, and cover the top of the bank with highland earth to mingle with the mud as it cracks by drying, and to prevent it from being washed and blown away." Probably the practice of covering the bank with turf, as above recommended, would secure it from being washed, or blown away, as effectually as any method which could be adopted.

When the sea encroaches on a low shore, it will be proper before attempting to execute any regular embankment, to make a careful survey of the coast, which is injured, in order to ascertain if there be any local circumstances, that can help to raise a natural barrier against the encroachment. In many places the sea is continually stirring up, and driving against the coast, quantities of sand and other materials, which either remain and serve to form hills or flats, or are carried back by the ebbing of the tide which brought them. In general, where the materials are of a solid nature, as shells, plants, or slime, they rest and accumulate, and raise the land above the danger of any encroachment from the sea. But where the shore consists entirely of sand, whatever quantities may be pushed forward at each tide, are immediately dispersed by the winds, and the shore remains open and exposed to every high swell of the sea. In such case, however, means may be adopted, for collecting and fixing the flying particles of sand; and it is certainly proper to prefer so economical an expedient to an expensive regular embankment.

Johnstone's chapter on Embankments, in the General Report of Agriculture in Scotland, vol. ii, p. 629, contains an account of a work of this kind, of which what follows is the substance.

The sea had for many years made encroachments on the estate of the Earl of Ashburnham, at Bembrey, in Scotland. It was the general opinion that a regular embankment must be formed, which would cost some thousand pounds. The Earl having several miles of coast. Mr. Tatlow, who first proposed the mode of embanking about to be related, observes, "the view that I first took, was upon a very windy day, and the shore, an entire sand, which extended at low water many miles. In riding along I perceived that any piece of wood, or accidental impediment to the course of the sand, raised a hill. It immediately occurred to me, that by making a hedge at the weak and low places, with wings to catch the sand as the wind blew it in different directions, I should obtain the desired effect. I therefore directed stakes nine feet long to be cut and driven one foot and a half into the sand, at two feet and a half dis-

tance from each other; betwixt which I had furze interwoven, so as to form a regular furze hedge, seven feet and a half high." This mode of embankment, it appears, proved successful. "Its present appearance," says the inventor after a trial of some months, "plainly evinces, that, at a trifling expense, I can secure Lord Ashburnham's estate from being inundated: for whenever the first hedge is not high enough to prevent the sea overflowing, another may be built upon the land formed by that hedge, and so on in succession till it is perfectly safe."

When the land is only overflowed during spring tides, there is time in the intervals, either to complete the embankment required, or to finish it in such a manner, that the flowing of the tide can do it no injury. But if the sea ebbs and flows every tide upon the land which is to be reclaimed, only small pieces of the work can be executed at a time, and the force of the water, at the flowing of each tide, is apt to destroy all that has been previously performed.

When only a part of the embankment can be executed before the return of flood tide, it is proper that what is done should be done in a complete manner. Thus, supposing a length of thirty or forty feet can be finished in one tide, it is better to raise it to its intended height, and to face the slope well with turf, than to commence a greater extent of bank and leave it in an unfinished state, exposed to the violence of the waves. It may be further remarked that, in low flooded lands, there are always several hollows, or water-runs, formed by the regress of the tide; and where the embankment has to be executed in different portions, it may be proper to build in the first place, across or over the spaces between these water-runs, so that the sea, having its usual channels of evacuation left open, will have the less tendency to injure the work. The spaces thus left may be filled up during the intervals between the spring tides.

A writer in the American Farmer, vol. ii, p. 131, gives a method of securing an unfinished embankment against being demolished by a current or tide which appears to us to be cheap, practicable, and is as follows. "A sufficiency of earth is collected, either by digging in the vicinity or by transporting it from the nearest high ground. A number of poles or stakes are then cut and brought to the bank, and at low water driven into the mud so as to form an angular pen in advance from each side of the gap. The poles are left thus driven in until the next low water, that they may adhere to the mud more firmly by suction: the earth is then thrown into the pen, and is protected by them from the friction of the tide until the next low water.—Other poles are then driven in advance of these on the same plan, and filled with earth, until the gap is gradually, but certainly closed."

The elevation and slope of the embankment should depend on the degree of exposure to the winds and tides, and the height to which the greatest tides are accustomed to rise. In every case, the bank should be at least two feet higher than the water during the greatest spring tides. In determining the slope, great care

must be taken to proportion it to the force of the sea, as nothing can be more ruinous, than to make the bank too bold or upright. A wave which falls on a flat surface dies without a struggle, while one that is stemmed by an abrupt rock strikes with tenfold force.

Along the back of all sea-banks, trenches should be made, and sluices erected at different parts to shut of themselves against any external water, and to open when the tide ebbs to let out any water from within.

These sluices should be so constructed as to let the water out of the marsh without admitting water from the sea. A method by which this may be accomplished is described by a writer in the *American Farmer*, vol. ii, p. 214, and is, in substance, as follows. It has been found that the common gates, heretofore used to exclude the tides from marshes, will not always answer. The tide creeps in so slowly, that it will not shut such a gate in time, nor press it too with sufficient firmness to exclude the flood tide; for chips, weeds, &c. were gently wafted into the gate way and lodged there, so as to prevent the gate from shutting quite close.—These tide gates were hung on hinges, either perpendicularly or horizontally, and it was found difficult to have them kept in such exact order as to exclude a slow tide. These, and other evils attending the old tide gates, are completely removed by the new invented *Tide Trunk*, which is perfectly firm, and closed merely by the act of the water's rising to a given point, without the least current whatever.

A *Tide Trunk* is a wooden oblong vessel, or square pipe, like a chest, open at the end next to the sea, river, or other water, which it is wished to shut out of the marsh, but closed at the end next to the marsh. At the closed end is a hole in the top. Beneath this hole, inside of the trunk, or chest, is placed a valve, consisting of light wood, which lies on the bottom, unless it is caused to float by the water flowing into the open end of the trunk, when it rises and shuts the hole at the top of the trunk. To the top of this valve is fixed a small iron rod, which rising perpendicularly, passes through a frame consisting of two upright pieces attached to the opposite sides of the trunk, and two cross pieces framed into the upright pieces in such a manner that holes may be bored in them through which the iron rod may slide up and down freely, and be kept in a perpendicular position, and thus keep the valve in its proper position, under the aperture of the trunk. The iron rod must be allowed to play with perfect ease through the frame, and be so light as not to prevent the valve from floating; and if there be any apprehension of its sinking the valve, the under surface of the valve may be coated with cork, to make it sufficiently buoyant to rise with the rod. There are other methods, which some prefer to keep the valve in its proper position, such as having perpendicular rods to pass through the top of the trunk in such a manner as to confine the valve to its place; or having slips of boards nailed perpendicularly on the inside of the trunk, in such manner as to give the motions of the valve the requisite direction. The upper surface of the valve must be smooth, and made to fit closely the under surface of the top of the trunk round the aperture or hole through which the water is admitted, as it drains from the marsh. The valve should be allowed to

move freely in the trunk, and yet be so large as entirely to close the aperture, in whatever way it may float up to it. Mr. Johnstone appears to entertain an opinion that a less complicated apparatus might answer the purpose of excluding the water of the tide from the trunk, and merely directs that the trunk have a proper flood-gate, or valve, fixed to the mouth of it, by hinges on the upper side.

As the water proposed to be drained off must flow over the top of the trunk, and descend into the aperture; and as it is important that the marsh should be drained as nearly down to low water mark as possible, the trunk, whatever may be its depth or width, should not be placed, with the interior surface of its top more than six inches above the ordinary low water mark; because there should be room for the water, pouring into the aperture from the marsh to clear itself over the valve. The height from low water mark to the top of the trunk, being so much deducted from the depth to which the marsh can be drained by the trunk; it should therefore, to pass the greatest quantity of water, be made broad in proportion to its depth, so as to allow of a large aperture, and to be placed as low as is compatible with its object and utility.

If one trunk should not be adequate to the necessary draining, two or more may be inserted—and as the tides are very irregular, it might be well to place one trunk lower down, on a level with uncommonly low tides, so as to take advantage of the greatest degree of draining, which such tides would afford. At the mouth of each trunk, it may be well to drive down stakes in such a manner as to prevent the entrance of leaves, chips, and other substances, which might impede the operation of the valve.

Mr. Johnstone in his tract upon embankments directs “to ascertain the exact height of the highest flood-tides, so that the embankment be raised at least two feet above what these may ever approach to. When this is done, the level must be taken, and stakes fixed to the proper height along the whole line to be embanked. Two frames of wood, of the exact form of the bank, should be made, and set up at the distance of twenty or thirty feet from each other, *exactly on the same level*, to guide and direct the height and dimensions of its construction, and the same level must be kept throughout the whole line. This is more requisite than in the case of rivers that have a descent in their current, and where the height of the water is regulated by the bill of the stream; for the surface of the sea water, being all on a level, the top of the embankment requires to be exactly parallel with the horizon, without a rise or declension in any part.”

As the pressure of the water upon an embankment against the tide, is different from that against the current of a river, it is not necessary to have it so straight, or of that uniform smoothness which is requisite where a running stream is to glide along the side of it. Where the embankment crosses any creeks or hollows, it will be necessary to increase the width of the base in proportion to the depth.

In forming the bank, the breadth, height, and strength must be made in proportion to the depth and weight of the water it may have to resist: taking into consideration the exposure to winds and the rapidity of the motion of the tide. As has been before observed, in substance, the more the slope towards the water approaches

to a degree of flatness, the greater will be the firmness and durability of the structure. In difficult cases, it is advisable, that the surface next the water should form an angle to a perpendicular line, of from forty to sixty degrees, according to the force to be opposed, and the nature of the materials of which the mound or bank is to be constructed. Where the foundation is firm and solid, the natural earth of the ground, where it is erected, may be employed, and will answer for the body of the bank, and for the inner surface, and where the pressure or force of the water is not very violent, the slope next to it may be formed of the same materials. But in cases where the force of the waves, by exposure to strong winds, operates more violently against the bank, the outer slope should be formed to the depth of two feet, with clay, or the strongest earth that can be conveniently got; and that, as well as the top, covered with well swarded turf. The inner slope, or that next the field or marsh to be reclaimed, should be sown with grass seeds.

Mr. Johnstone says that “The stuff for forming the bank, should be mostly taken from the side next the water, that as little of the surface within may be broken as possible; only by what is taken from the back cut or drain, that is necessary, along the embankment on that side.”—An American writer, however, advises in banking against a river or creek, to leave “a sufficient space between the edge of the river or creek, and bank,” and to “form the bank by earth taken altogether from within it.”* Mr. Johnstone, however, in advising to take the stuff to form the bank from the side next to the water is giving directions for embanking against the sea, and the American writer has reference to preventing the encroachment of water from a river or creek. We shall leave this question to be decided by professional engineers, observing, that all writers on this subject agree that the earth of which the embankment is composed, should not be dug out very near to it, but a considerable margin should be left between the excavation formed by digging out the earth, and the mound or embankment which is formed by such earth.

No stones should be left near the foot of the embankment; for the tide forming eddies round them, would soon make holes and break through the bank.

Embankments of the kind under consideration are liable to be destroyed by the waves, ascending the inclined plane next to the sea, and, when the tide ebbs, returning with force, and washing away materials with which the bank is composed. Covering the bank with turf, as before recommended may in many cases answer the purpose. As a further security, in situations of great exposure, the most effectual protection is to drive piles in front of the bank, to break the force of the waves. An English engineer, Mr. Beatson, says, “some years ago, when I was on duty as an engineer at a fort near Portsmouth, built on a point of land much exposed to the sea, the waves made such havoc, that the walls on that side were constantly giving away, although built in a most substantial manner, and having bulwarks of large heavy stones besides, to protect the foundation: however all would not do, these bulwarks were soon knocked to pieces, and several times the wall itself. At

* *American Farmer*, vol. ii, p. 131.

length, it was proposed, to drive a number of piles, about forty or fifty yards from the fort.—Those piles were twelve or fifteen inches in diameter, and driven about one diameter from each other, nearly in a straight line parallel to the wall where the waves did so much damage. They were driven into the ground with a pile engine, till perfectly firm: perhaps eight or nine feet deep, and about two feet of the top of them left above the level of high water mark.

"After this was done the walls received no farther injury, the space between the piles and the fort being always perfectly smooth, however tempestuous the waves might be without."

Where the force of the tide is not very great, by giving the face of the bank a great degree of slope, small stones, coarse gravel, or broken brick may be spread on the surface, about a foot thick, which if well beaten down will make a safe and durable fence. Brush wood also, spread on the surface of the bank, and well fastened down with hooked pegs, is found to answer the purpose well. The wood is liable to decay, and requires to be frequently renewed; but when it can be easily procured the expense is not great.

In consequence of the counteraction of the sea, all streams spread greatly at their mouths, and the earth they bring down is deposited there, and accumulates into shoals and inlets.—The soil which is thus formed, is invariably of the richest kind, and the recovery of it becomes of course an object of proportional advantage.

The most advisable and effectual plan for this purpose, when it can be executed at an adequate expense, is to alter the course of the river altogether, and make it discharge itself at some new point of the coast, where the land that would be occupied by its channel might be of less value, and its discharge less liable to be choked or shifted by the regorging action of the tide. When this has been done, it was found, that the old channel, in the course of a few years was filled up, and the sea quite excluded.

The practicability and economy of embanking and draining lands which are usually overflowed by tide water has been evinced by many successful experiments. Holland consists mostly of land reclaimed from the sea; and in England, many hundreds of thousands of acres have been acquired by means of embanking. There is no doubt but valuable tracts might in the same manner be reclaimed along the sea coast of Massachusetts and other maritime parts of the United States. In the Southern states draining and embanking have been successfully undertaken; and the Messrs. Swartwout's and their associates of New York, have distinguished themselves by a similar enterprize in the vicinity of that city. We shall give some account of this last mentioned undertaking, extracted from a Report of a Committee of the New Jersey Salt Marsh Company, published in the *American Farmer*, vol. ii, p. 151.

"In 1813 and 1814, the Messrs. Swartwout's purchased the Newark Meadows, and in 1815, commenced the work of their improvement.—They were then in a dreary, sunken and desolate situation, subject to the inundations of every tide from the river, and totally destitute of cultivation. Few or no attempts had been made in this section of the union, to reclaim salt-marshes of any extent. The most economical

and improved method of draining and embankment was not understood, and the price of labor much higher than at present.

"The former proprietors of these meadows, however, under every discouraging circumstance, calculated to defeat a great undertaking in its incipient stages, commenced their operations and succeeded, as far as individual enterprize and capital would permit. They embanked two thousand acres, making an embankment of five and a half miles in length, sixteen feet wide at the base, and five feet high. One thousand acres they ditched and drained, making a length of ditch of seventy miles and upwards.

"There remains to be embanked one thousand acres, and two thousand acres to be ditched and drained. The method of accomplishing this object is at once plain and simple. The tides must be excluded, and the land redeemed from its wetness. It will be necessary to raise an embankment, similar to that already described, and extend it about five miles, and to ditch that part which remains in a state which precludes cultivation. When this is effected, two thousand acres of most excellent soil will be ready for immediate cultivation, and the remaining thousand be in a similar state in two years. The whole of the remaining work could be executed in ninety days."*

The Committee then expatiate on the advantages to be derived from this improvement, from its location near the great and growing city of New York, the fertility of the soil to be reclaimed, &c. &c. and continue as follows:

"The embankment and draining of meadows will soon become an object of much consideration. So it has been with other countries. What was Holland but a sunken marsh, before the sea was shut out, and the lands drained? It is well known that some of her most fertile soil was once deeply covered by the ocean, and is now forty feet below its surface! Four hundred years ago, the British Parliament began to aid individual enterprise, in reclaiming meadows and marshes. The Bedford level, once a waste, contains 300,000 acres of reclaimed soil, and the Romney marsh 40,000 acres. Embankments in England have been erected to the height of 18 and 20 feet, and extended to the length of ten miles," &c. "In Denmark, the government have encouraged individuals and companies to embark in these substantial and profitable speculations, by large loans of money. In one year, upwards of one million of rix dollars were advanced for these purposes. Such has been the extent of unoccupied lands in the United States, and the ease with which the fee is obtained, that draining and embankment have not constituted an object of general interest. In the Southern States, however, some advances are made in this kind of industry. Draining and embankment have been successfully undertaken on the Cape Fear, Waggermaw, Santee, Ashley and Cooper, and Savannah rivers. As population clusters upon the sea board and upon the margins of our bays and rivers, we shall find a new channel opened to the industry and capital of our citizens, from which individual gain and general advantages will result." The Committee then state, in substance, that the capital

* This Report was presented in June, 1820. We are not able to say what measures have been pursued since that period for embanking and draining the marsh it refers to.

stock of the New Jersey Salt Marsh Company consists of three hundred thousand dollars, divided into shares of fifty dollars each; and go into calculations to show that "the dividend to be derived to the stockholders, according to the most reasonable computation, must be seven per cent. for the first fourteen years, and will probably ever after pay from 12 to 15 per cent. on the capital stock."

There is a mode of improving lands situated at or near the mouths of rivers, which deserves notice, although we cannot assert that it will be found eligible in the United States. There may, however, be situations, in which it can be adopted to advantage, and we shall therefore briefly advert to it. It is called "*Harboring Land*." It is effected by conducting water, which holds earthy matters in suspension, washed down by rivers to their mouths, from the stream in which they flowed, over barren or marshy ground, that the earthy matters may subside, and add to the soil which is thus overflowed. The ground which it is wished to improve by this method is surrounded by bank high enough to confine the water. The tide is then admitted, and detained till the sediment is deposited on the surface of the soil. The water must be at command, and there must be not only a canal cut to join the river or tide water, but a sluice, or sluices to open or shut as wanted. Tide trunks with some variation in their construction as respects their valves, from that heretofore described, may answer for these sluices. The effect is different from that of irrigation, for it is not produced by the water, but by the mud which it holds in suspension; and the object is not to manure, but to create a soil. This mode of making land has been practiced in Italy to great extent, and with corresponding advantage. For further directions relating to this important subject, we would refer our readers to *Rees' Cyclopaedia*, Art. *Embankment*; *Sir John Sinclair's Code of Agriculture*, p. 268, 272; *Gen. Report of Agriculture in Scotland*, vol. ii, p. 615; *Beaumont's Essay on Embankments*; *Communications to the Board of Agriculture*, vol. ii, p. 211; *American Farmer*, vol. ii, p. 131, 143, 153.

New Jersey Canal.—Gen. Swift and Col. Renwick have reported to the Commissioners, at Morristown, that the plan of uniting the Delaware and Hudson by the Musconetcong and Passaic rivers may be accomplished without serious obstacles; that its completion would be attended with immense advantages to the Iron Works in New Jersey, and supply the city of N. York with coal from the mines on the Lehigh river, in Pennsylvania, at a low price. It would also furnish the citizens of East Jersey with a more ready conveyance of their agricultural products to the N. Y. market.

Flax-dressing machine.—J. M. Ely, Esq. of New-York, recently returned from a visit to Europe, examined Mr. Brindley's establishment in London. Mr. B. informed him that he had invented a machine for dressing flax which he will warrant to accomplish all that can be desired. He had not filed a specification of his machine, but he was confident it would supersede those now in use in England.

Receipt for Sausages.—For 10 lbs. of meat, take 4 ounces of salt, one ounce of pepper, and sage and other herbs to your taste.

AN ADDRESS

DELIVERED BEFORE THE ESSEX AGRICULTURAL SOCIETY, AT THE AGRICULTURAL EXHIBITION IN TOPSFIELD, OCT. 2, 1822, BY PETER EATON, D. D. OF BOSTON.

It is evident from the constitution of man, it was the original design of Providence, he should derive his subsistence from the earth. Want soon impelled him to repair to this nourishing parent. Tilling the ground was an art not unknown to the first human family. Where man has existed in the most rude and savage state, the chase has been a favorite pursuit. This, however, affords a precarious and sometimes a scanty support. In proportion as civilization has spread, and a knowledge of the arts been cultivated, agriculture has claimed attention.—Its progress was slow and inconsiderable in the early ages. Every thing was to be originated. There were no hints by which to profit—no rude instrument on which to improve—nothing to aid and direct inventive genius. Hence, the instruments of husbandry were very imperfect; yet necessity, the parent of invention, led to the discovery of some of most essential use.

Sicily was the first state in which agriculture attained any considerable improvement. It was here, also, religious rites were first instituted in honor of Ceres, the goddess of husbandry.—From this country a knowledge of the art was carried into Greece and the northern parts of Europe. In the early ages of Rome, relaxation from the toils of war was frequently devoted to the cultivation of the soil. The high and the low, the patrician and the plebeian were united in the same employment. All distinctions of rank were lost in the field. Those of the first standing in society might be seen toiling with the peasant. Not only nations the most civilized, but even those the least cultivated and improved, have considered agriculture the most important of the arts of life, because it provides for the support of life. To do honor to the employment, and encourage the pursuit, Roman dictators followed the plough; and the emperor of China, with the grandees of his empire, make an annual appearance in the field, to sacrifice to their god, that he may be rendered propitious to the labors of the husbandman.—But it is not my purpose to trace the progress of the art. I would contemplate it as it now exists.

Gentlemen, I feel incompetent to the task assigned me, possessing neither that theoretical or practical knowledge necessary to furnish me for the occasion. As I have gleaned but sparingly from experience, and not had opportunity to consult the writings of those who have attended scientifically to the subject, you may expect only a few common-place remarks.

No country holds out greater allurements to agricultural pursuits than the United States. Nature has obviously designed this for a great farming nation. With a population spread over a vast extent of territory—blessed with a soil rich and fertile—the inhabitants distinguished for habits of industry and perseverance—the country intersected with rivers and canals, opening a free communication with the sea-coast, which skirts our whole border—our merchants surpassed by none for calculation and enterprise—with ports open to all nations—we have every possible encouragement to nourish and improve the arts of agriculture. It is the life of

our commerce, and commerce richly repays the industrious husbandman. Too often has there existed a spirit of jealousy and rivalry, between the commercial and agricultural interests. They are as intimately connected in this country as cause and effect. England is a commercial nation, but of produce she is often a purchaser. It is her manufactures that cherish her commerce. In America, it is the *farm* which gives activity to commerce, and commerce which makes the farmer rich. Though agriculture is of vital importance to the prosperity of our country, yet from its first settlement, till a recent period, this art has been left to itself, neglected and uncouraged, and been under the management of those who reflected nothing more on the subject, than just sufficient to perform the manual labor on the farm. Either from a want of ability or inclination, few have inquired, whether there was any defect in our system of husbandry, or whether it was susceptible of improvement. Hence the same annual routine of service has been performed on the farm—the son following the footsteps of the father, and continuing to cultivate the same field, because his father had done it before him.

We congratulate our country, that societies are forming in every section of the Union—that gentlemen of talents and acquirements are lending their aid to this neglected art, endeavoring to discover the defects of our system, and by experiments to ascertain the improvements of which it is susceptible. Much has already been done, an almost certain evidence more may be done, and sure pledge it will not be left undone.

So inconsiderable is the gain of husbandry, so laborious the employment, as to present little inducement to young men, of talents and knowledge, to engage in the pursuit. The enterprising youth looks around him for the lucrative employment, by which he may raise himself to affluence and ease. The only reward agriculture promises to the most persevering industry, is little more than a bare support. A further discouragement is, it has been considered a menial employment, less honorable than other occupations; and the sentiment has obtained, that nothing more is necessary to make a farmer, than a vigorous constitution and a robust body. Never was there a conclusion more erroneous. The inference that any man is qualified to manage a farm, is as absurd, as that any man is qualified to manage a ship at sea. It requires careful observation, sound judgment and a discerning mind. In every other art and trade, practice and experience are thought indispensable; and is no skill necessary in conducting the complicated concerns of a farm? The practical attention now paid to husbandry, the lively interest taken in the subject by gentlemen of honorable standing in society, have a tendency to raise the reputation of this too often despised profession.

In commendation of this employment, it may be observed, it is favorable to morals, health of body, and vigor of mind. It is friendly to morals, not presenting those temptations to deception and fraud, nor affording opportunities for imposition, nor inviting to the practice of that chicanery, to which some other employments hold out a lure. The time of the farmer is devoted to himself. He labors in the clear light of heaven; and if he cheat his

farm, he cheats himself. Besides, he is habitually conversant with objects, which cannot fail to conduct his mind to that Being, who superintends, directs and governs all.

This employment conduces to health of body. Some mechanic arts and manufacturing establishments are debilitating in their influence.—They produce a sickly body and enfeebled mind. The farmer breathes a pure, uncontaminated air; and if his day is toilsome, his rest is sweet. To no one class of men are we more indebted for our independence, than the hardy yeomanry of our country. From this class were selected some of your ablest generals and bravest soldiers; and on this class, more than any, rests our hope for its preservation.

Nor will it be said that husbandry is unfavorable to mental vigor. If we do not find, nor should we expect to find, those literary acquirements and general information which obtain among some classes in the community, yet where do we meet with sounder sense and judgment, and greater intellectual vigor, than among our industrious farmers?

The great principles of agriculture are the same in every country; and the plough, the hoe and the harrow are of essential use: yet, so various the climate and the soil, as in some respects to require a different process. One nation cannot adopt the precise system of another. Labor is of the first importance in conducting a farm. In old countries, with a dense population, where it is much cheaper than in America, undertakings may be justified, and attempts at improvement made, which might prove ruinous with us. The disproportion between the price of labor and produce, is a bar in the way of agricultural success. The large extent of our unsettled territory, blessed with a salubrious air and fertile soil, where a farm may be obtained for a trifle, renders it probable this disproportion will long continue. As one country cannot take another for a perfect model in agricultural pursuits; in our own, so different our climate and soil, that the South and the North cannot adopt the same process; and even in the state of Massachusetts, so various our local situations, that each section must adopt a system, in some respects peculiar to itself.

The society, which I now have the honor of addressing, while desirous of diffusing information and of encouraging the interests of agriculture in general; yet in its formation and in the progress of its measures, has had a primary regard to the advantage of the county of Essex. As every district in the Commonwealth has its advantages and disadvantages, the soil various, and that article may be cultivated in one, unsuited to another; it would be for the interest of husbandry in general, that societies should be as numerous as our districts. Even in the county in which we dwell, certain portions enjoy advantages denied to others. Farms located near populous towns, or the sea shore, can be furnished with manure, with greater facility than in the country. General principles in agriculture may be established and recommended, but specific rules are as various as the location of farms, which the judgment and discretion of the manager must search out and prescribe for himself.

The farms in this county (with exceptions not numerous) consist of from forty to an hundred and forty acres of land. In experiments and researches, is not special reference to be

ad to the interest of the farmer, and what can be accomplished by this class of the community? A gentleman, with a capital, may gratify his taste and curiosity in conducting his farm.—With him, it is immaterial, in his mode of cultivation, whether he is remunerated for his expense or not. Not so with the common farmer. In any particular method of manuring and cultivating recommended, the first inquiry is, what will be the clear gain, and shall I realize it at the end of the first or second year? It is to be remembered by our cultivators generally in Essex, that the farm is their dependence; nor can they adopt any system of husbandry which will not give them an immediate profit.

The gentleman of capital, whose farm is his amusement, may wait years for his reward.—The common farmer wants his pay down. Plans of improvement have been recommended, practicable indeed to the man of wealth, but wholly uninteresting to the mass of farmers in Essex, because beyond their ability. They can adopt no system, which the *farm itself* cannot support. It is a maxim in husbandry, that no scheme of management is of advantage to the community, which will not give a profit; and that is the best which will afford the greatest profit with the least labor and expense. In every pursuit, commerce, manufactures, the mechanic arts and agriculture, gain is the first object. Schemes of cultivation have been proposed, but visionary, because you would be left in debt. With great expense I may obtain great crops; but if not remunerated for the labor and expense, even my great crops will ruin me. The question is not simply, How a great crop may be obtained; there is a second question, Will this great crop pay for itself? It is no valuable improvement in husbandry, to increase your productions, if your expense is proportionably increased; because it leaves you no additional gain. If, with a certain portion of labor and expense, I can obtain forty bushels of corn from the acre, and the expense must be increased in proportion to the increase of crop to raise an hundred bushels, where is my profit? It is of importance, then, in every proposed improvement, that careful calculations should be made of the increased expense. The great desideratum is, to increase the productiveness of a farm, so that the expense may bear a less ratio to the increase.

The moderate size of our farms in this country renders it necessary, that husbandry be conducted on a limited scale. A small farm, however, well cultivated, is much more profitable than a large one, which is neglected. Many of our farmers have materially injured themselves, by endeavors to gratify an insatiable desire of possessing much land. Nothing gives them more pleasure than adding field to field. In justification, it is pleaded, their property vested in land is secure. This remark may be just; but you often sacrifice one half to secure the other. It is bad management, and a mistaken policy. Admitting you can purchase land without involving yourself in debt, and place it in a state of cultivation, the measure may be judicious. A more common practice is, to plunge into debt for the purchase, and to leave the land half cultivated. The consequence is, the interest of the money, taxes, and the expense of labor, eventually consume the purchase. How many of our farmers complain they are in

debt! and these debts have principally been contracted by purchasing land they cannot half cultivate.* In the country, rarely will you find a field which will pay the labor, the interest and the taxes. By purchasing, then, you impose a burden on yourself difficult to sustain. Many have been impoverished, and not a few have been ruined, by possessing themselves of land for which they could not pay. The intelligent farmer, before he plunges into debt, will not fail to attend to this plain question, Will the income of the intended purchase more than repay the interest, the labor and the taxes? If not you are better without the land. The possession of more land than can be improved is a tax upon the owner.

It has been said, nor can it be too often repeated, that manure is of the first importance on a farm. Notwithstanding the various ways of collecting it have been pointed out, its utility and necessity urged by scientific and practical men, little attention is paid to the subject by one half the farmers in the county. Nothing more is provided for their fields, than what is collected from their hovels in the winter, and the pens of their cows in the summer. He who does not attend to this branch of husbandry, is not deserving the name of a farmer. Every barn yard, after being emptied in the spring, should be immediately replenished, either with scrapings from the streets, earth which has been collected by wash, or the vegetable soil of low meadows. The latter is preferable for warm, dry land. Where cows are folded over the night, a most valuable composition may be prepared through the summer. It is known to every farmer, that turning it often with a plough or fork will greatly increase its value. Of manure, too much cannot be said. The subject cannot too frequently be brought into view, nor too pressingly urged. It gives you grass and your grain. Although there is little danger of applying too great a quantity to your land, it may be used to excess. Indian corn will bear a free dressing; but your crop of small grain may be injured by manuring too highly. It will either be choked by weeds, or fall down and perish before ripe. Even grass land may be manured to excess—causing your grass to fall before half grown; or, if it escape this calamity, is rank and coarse, and not relished by your cattle. On the rich bottom lands in the Western States, when first cleared, a succession of crops of Indian corn are taken off to reduce the land, before wheat is applied.

* This is often the effect of a pardonable pride—that liberty in which we glory—liberty for every man to dispose of his own property as he pleases, or, if he dies intestate, the law divides it equally among his heirs. In England, though the laws do not forbid a division of their large estates, the eldest son usually possesses the soil and titles of his ancestors; the younger branches of the family not participating in the landed property. In the United States, as the law makes an equal distribution of property among the heirs, one takes the farm by paying out legacies. Unwilling to dispose of the paternal inheritance, he commences life with a burden of debt; under the weight of which he is often crushed. The child who inherits the homestead, is usually envied. More frequently is his the harder lot. This law, which equalizes property in a family, is productive of one happy effect; it preserves an equality among our citizens, not known in England; and, so long as this law shall be in force, will forever preserve us from the evils of those wide extremes there experienced—overgrown wealth, and abject poverty.

Few articles are cultivated with greater profit and success in this country, than Indian corn. The valuable uses to which it may be applied, are well understood. Yet errors, undoubtedly, obtain in its cultivation. It is a general practice with good farmers, to give their corn three hoeings, without regard to different soils, or the state of their land. Whereas four hoeings are more necessary for some fields, than two for others. It is indispensable that the weeds be kept down, let it cost what labor it may. If three hoeings will not do it apply the fourth. Permit them to grow, not only do they injure your present crop, by taking the moisture and nourishment from your corn, but suffer them to seed, and a foundation is laid for a harvest of weeds the following year. Indian corn is usually succeeded by small grain: and how often have we observed it choked, and, before harvest, overtopped, by weeds sown the preceding year, through the neglect of the husbandman! In land naturally weedy, when sown with small grain, I have sometimes nearly lost my crop by its being overtopped, by weeds. The evil has been remedied, by increasing the quantity of seed. Upon the farm on which I was born and brought up, (my father was a husbandman) it was practised, in planting Indian corn on sward land, to put the summer manure into the hill: the winter manure was spread, and, as was termed, harrowed in, but not a fourth part was covered; the rest was lost by evaporation. This injudicious practice is still continued by many farmers. To our President we feel indebted for many valuable remarks on this subject.* If corn is hoed after it begins to top, the plough ought not to be used. It has been found at this advanced state of the corn, that fibres extend four and five feet, near the surface of the ground, in search of nourishment. These fibres are cut by the plough; the corn is deprived of much of its nourishment, and your crop is injured. If necessary to remove weeds, let the hoe be the instrument. It is believed to be of consequence, that attention be paid to the form of the hill. Some prefer a large hill, of a conical form, as it will preserve the stalks more erect; and by making a large hill, all the manure is brought into the vicinity, and the corn will more readily avail itself of the advantage. A flat hill, of a moderate size, is unquestionably preferable; the stalks are permitted to spread themselves—are not so easily broken by the wind—more readily admit the sun, the dew and showers. Nor is a large hill necessary, that the manure may be drawn up; the fibres, which wander so far in search of nourishment, will find it, if upon your land.

Summer wheat, though a most valuable grain, is not adapted to the county of Essex. In some of our western districts, it may be cultivated with success, while we have sustained from its cultivation very material loss, within the last thirty years. Not oftener than once in three or four years do you obtain a decent crop. In the intermediate years, your produce is small. Average your grain for four years, and you find the profits light. Still, the farmer lives in hope, and continues the cultivation of a grain which but indifferently rewards him for his labor. Whereas, barley and oats rarely fail

* See Hon. Mr. Pickering's Address to the Essex Agricultural Society, 1818, pages B. 9.

you. It is owing to our proximity to the sea, that our wheat is oftener blasted than in more inland counties? And why is one field, with us, blighted like Pharaoh's corn, while another, but little removed, is rank and full? Enquiries into the cause are well worth the attention of the philosopher.

It is very desirable that our wet meadow-land, much of which is now almost useless, might be rendered productive. These lands we possess to a considerable extent. Is it impracticable to introduce the fowl-meadow grass? Has the experiment been sufficiently tried? Some meadow land has been improved by draining and carrying on earth. The late Col. Baldwin, a gentleman of a truly philosophic mind, gave me the following facts. Having occasion to build a barn, he formed the purpose of opening a cellar under it, for the reception of manure. The plot on which the barn was to be erected was a light sandy soil. In the vicinity was a boggy meadow, through which he cut wide ditches, with sides not perpendicular, but on the principle of the inclined plane, to prevent filling. In the winter, when frozen, the ground was covered with sand taken from the cellar, this again with the earth taken from the ditch. Clover and herds-grass seed were then sowed, which grew luxuriantly, rising to the height of three or four feet, giving him three tons to the acre. It may be questioned, however whether this was the most proper seed to apply. Clover and herds-grass are not natives of the bog meadow, and after being introduced by artificial means, will degenerate. Had fowl-meadow grass been substituted, his success doubtless would have been greater. This valuable grass delights in being irrigated, yet will not flourish amidst stagnant water. It may be introduced by burning, or ditching and carrying on earth. In some parts of Worcester county, it has been introduced with great advantage into wet meadows, which had been useless. I regret it is not in my power, at this time, to make some more particular communications in regard to this excellent fodder.

Change of crops is ever thought of importance by the intelligent farmer. In every soil there are ingredients suited to the nourishment of certain plants. Hence, we see different soils spontaneously yielding different trees, roots and vegetables. In vain you attempt to raise particular vegetables on certain soils. The reason they will not flourish is, the soil does not possess those particular qualities or ingredients necessary for their support. Often it is impregnated with qualities which are injurious. Useless the attempt to cultivate the willow on the sandy desert, while some vegetables will flourish no where else. Every plant has a particular constitution (if I may be allowed the expression,) which requires a particular climate, soil and nutriment, and if denied either, becomes feeble, sickly, and may die. Following land with a succession of crops of the same kind, may eventually exhaust it of those particular qualities in which they delight. A field of potatoes has been reared, of the most luxuriant growth. In the following year the same crop continued; and, though manure was abundantly supplied, it was feeble, and of scarce any value. Did not the preceding planting exhaust the soil of those particular qualities in which the root delights? Succeeded by different seed, the in-

crease was satisfactory. It being most evident, there is something in every soil particularly suited to nourish certain vegetables, may not these qualities be exhausted, and render a change expedient and profitable?

A common error we observe in husbandry is, continuing the cultivation of the same field, while others, of a better soil, are permitted to lie neglected. How often we see the son planting and sowing year after year the same spot of ground, for no better reason than that his father did before him; while by the side lie lands of a far richer soil, devoted to grazing. Old worn-out lands are followed with the plough and the hoe, affording a very scanty increase; while a rich soil is neglected, because it would require some labor to subdue it. The judicious farmer will scarcely think of estimating the expense of subduing a soil naturally rich and fertile, knowing he will be amply remunerated by the increase.

It is believed this is a too prevalent error with our farmers: they have a certain set time, in which their sowing and planting must be completed; and do not pay due regard to the season, and the state of their land. The husbandman should be carefully observant of the opening and advance of the season, and have particular respect to the state of his land in putting in his seed. Is your land wet, you must wait till it acquires sufficient warmth and dryness for the seed to vegetate. Many crops have been lost from an impatience to have done sowing and planting.

We cannot refrain from expressing our gratitude to those gentlemen who originated this society, our satisfaction in the interest taken by them in the improvement of our husbandry, and the success which has attended their measures. Certainly, a new impulse has been given to agriculture, and a spirit of inquiry excited.

You will permit me, in the name of my brethren in the ministry, to express their thanks for that act of civility, by which they have been constituted members. This acceptable notice is duly appreciated. Being most of us connected with farming parishes, bound to our people by the cords of duty and love, we cannot but take a lively interest in their temporal prosperity, as well as their moral and religious improvement.

Industry is of the first importance to the farmer. Neglect your farm, and your farm will neglect you. Solomon was a wise observer, and a practical preacher. His observations on men and things, and the lessons he has left us, are of inestimable value. The picture he has drawn of the indolent man, is done with the pencil of truth: "I went by the field of the slothful and by the vineyard of the man void of understanding; and, lo! it was all grown over with thorns, and nettles had covered the face thereof, and the stone wall thereof was broken down. Then I saw, and considered it well: I looked upon it, and received instruction. Yet a little sleep, a little slumber, a little folding of the hands to sleep: so shall thy poverty come as one that travelleth, and thy want as an armed man." With industry must economy be united. Every experienced husbandman, who has only his farm for his support, has learned that close calculation is necessary. In past years, the enhanced price of produce could support ex-

penses which now require retrenchment. We have pleasure in knowing, our intelligent farmers are learning the lesson, and beginning to live within compass. With our industry and economy, let us combine a humble dependence on that Superintending Power, who has given us a good land, is the great parent of the human family, and whose favor we have reason to expect, in proportion to our faithful exertions.

From the Boston Patriot of February 13.

NORTHERN COTTON.

The bolls of Cotton forwarded to us with the following communication, are large and well filled. They are even larger than several specimens of the plant produced in Louisiana, which have been heretofore shown to us.—With our highly intelligent correspondent, however, we agree, that the culture of Cotton in the Northern States cannot at present be productive of profit. The high price of labor, compared with that of slaves, is an obstacle.

BRINSLEY PLACE, (Roxbury,) Feb. 14.

Messrs. Editors.—In your paper of yesterday, I noticed a communication from the New-York Statesman, on the cultivation of Cotton in the Northern States, in which the result of experiments made in that State and Connecticut was given.

On the first of May last, I planted about twenty hills of Cotton, three feet apart, the ground having been previously manured: it came up on the 18th; and on the 5th of November, I picked a number of bolls perfectly ripe. The first frost which affected the plants, was on the 22d of October, but many of the bolls had at that time attained their full size, although there were still blossoms on the plants.

I send you some of the bolls, in which the Cotton appears delicate and of a good quality.

I should have planted the Cotton early in April, which would have given nearly thirty days more for the plants to come to maturity, but could not obtain the seed.

Last summer, Com. Bainbridge procured and sent me some seeds from South-Carolina; and this year, I shall make a more extensive experiment, but am not sanguine that this valuable staple of the south, and one of our chief articles of export, can be cultivated to advantage so far north.

Yours, &c.

H. A. S. DEARBORN.

From the American Farmer.

RUTA BAGA—cultivated as a second crop.

Albany, N. York, 4th January, 1823.

DEAR SIR—My improvements in the ruta бага culture consists in growing them as a second crop, upon a clover lay. The grass is cut about the 15th or 20th of June. If I have manure, and the scrapings of my yards will always afford me a few loads, I take about a dozen carts full and spread it upon an acre. The ground is then immediately ploughed well, one pound of seed sown broadcast per acre, and harrowed with a light harrow, lengthwise of the furrow. A single thinning and cleaning with the hoe, is all the further attention I give them, until they are drawn in November. My first experiment gave me a product of six hundred bushels. They should be thinned to a distance of eight or twelve inches; and for this operation a slane hoe of the required width has

decided preference over the common hoe. he stubble and roots of the clover decompose rapidly, afford nutriment and moisture, and render the soil friable and light.

I am, dear sir, yours, &c.

JOHN S. SKINNER, Esq. J. B***.

American Porcelain Clay.—The proprietors of extensive bed of what by competent judges is been pronounced genuine porcelain clay, situated in Rowen county, North Carolina, wish to ascertain if there is in the U. States a manufactory for converting this kind of clay into ware—what would be the probable cost of such an establishment—the expenses in carrying it on—and whether persons can be procured in this country who understand the business. There be any who can answer some or all of these questions, they will do service to the country as well as the proprietors, by giving information on the subject. Communications sent to the editor of the American Farmer, Baltimore, will meet the eyes of the inquirers.

THE FARMER.

BOSTON:—SATURDAY, MARCH 1, 1823.

In consequence of the length of some of the preceding articles we have been obliged to defer till our next issue valuable communications from highly respected respondents, who will, it is hoped, excuse a delay, which could not well be avoided. The ably written, highly useful original articles which we receive frequently of late, augur favorably to our establishment. We are highly gratified in finding practical men disposed to send us the fruits of their experience in husbandry, and confident that they will find in reward in the consciousness of having contributed to the benefit of the community, and added somewhat to the happiness of their fellow creatures.

We hope, with some degree of confidence, that the spirit of the New England Farmer, will be found as connected with "the greatest good of the greatest number," that many a "good man and true" will find us a helping hand, or a counselling head, who will not yet favored us with his assistance. It is a good general rule that whatever benefits the whole community promotes the private interest of every individual; and of course every individual has interest in the diffusion of agricultural knowledge, though he may not himself be employed in agricultural pursuits.

The Connecticut Herald, a newspaper printed at New Haven, is now conducted by Dr. Percival, who has acquired much reputation as a poet. Many people are erroneously supposed that a man who is an adept in writing verses, must, of course, be a novice in every thing else. But, we doubt not that Dr. Percival will prove that the same intellectual powers which may be directed to poetical eminence, may establish a claim to celebrity in any of the pursuits of literature or science to which he may think proper to turn his attention.

FARMER SUMMARY OF NEWS.

CONGRESS.—Mr. Johnson, of Ken. introduced in the Senate, a resolution, which was afterwards modified by Mr. Mills, for instructing the committee of the Judiciary to inquire into the expediency of collecting and digesting into one bill all the acts of Congress relative to the courts of the United States; and to report some mode of effecting that object, together with such changes as might best promote the ends of justice.—

This bill was agreed to. The Vice President of the Senate, having withdrawn from the chair, Mr. Gaillard, of S. C. was chosen President *pro tem* by 32 votes, the whole number being 42. A bill to provide for the settlement of Gov. Tompkins' accounts has passed both houses. The New Tariff Bill has been debated with great warmth and animation, but nothing respecting it has yet met with a final decision. A resolution has been agreed to for appropriating \$50,000 for constructing docks and wharves, connected with Rogers' Marine Railway, or inclined plane. But little matter of much general interest has, however, been finally settled since our last.

FOREIGN.—A letter to the editor of the Aurora, dated at Curacao, Jan. 18th, says, "An hour ago a Colombian schooner of war, hove too, off this harbor, and sent her boat on shore. She has had only six days passage from Maracaibo, which is closely blockaded by 29 vessels of war, under Com. Belluche, and that Gen. Urdanette, with 4300 men, is closely besieging the same place. Morales is completely hemmed in, and the town must necessarily fall. By the time this reaches you, it no doubt will be in the hands of the Patriots."

Passengers in a vessel arrived at New Orleans, reported that the troops under Iturbide, Emperor of Mexico, were closely blockading Vera Cruz and Alvarado. Provisions had risen to an enormous price in Mexico. No particulars had been received of the operations between Xalapa and Vera Cruz.

On the 1st of December the city of Grenada (Nicaragua) was visited by a tremendous earthquake, which cracked the walls of most of the houses—threw down the crosses before the churches—and split the tops of the mountains in the vicinity.

It is reported that the Spaniards in Peru have commenced negotiations with Gen. San Martin to leave the country, and there is reason to believe that the treaty will be effected.

The prospects of the republic of Colombia are said to be flattering. Morales had evacuated Maracaibo, and marched for Porto Cavello. Gen. Montilla was in his rear with 4300 troops. Paez was in his front and occupied with a strong force, all the passes leading to Porto Cavello. The Royalists have little naval force, and the Republican squadron possesses command of the sea.

DOMESTIC.—Com. Porter's squadron, intended to chastise the pirates on the coast of Cuba, sailed on the 14th Feb.

Messrs. N. M. Hallowood and Geo. N. Fisher have succeeded in recovering the goods which were stolen from their store on the 8th ult. The thieves were traced to St. Armond, in Canada, and with the assistance of Benj. Thacher, of Montreal, and Mr. Warren Jones, of Montpelier, (Vt.) the whole of the goods were recovered, and, together with one of the thieves, whose name is Edwards, were brought to this city on Monday—the other had not been detected.

In the State of Maine there are two colleges, and from 20 to 30 academies, endowed by the state. Every town is, by law, obliged to raise an annual tax, equal at least to forty cents on each of its inhabitants. There is, throughout the state, one school-house for every 200 of its inhabitants, making about 1500 in the whole.

The late fire at Meredith.—All the girls that leaped from the windows, are very seriously injured. Two or three, it is supposed by the surgeons, mortally. The spines of the backs of six of them were materially injured; one had her skull fractured, and the flesh of her forehead lacerated, in a most shocking manner, also the bone of her right thigh broken very badly, the upper extremity of which was driven through the flesh into the snow or earth. Others being pushed through the windows, face foremost, struck with their hands and faces, and dislocated both wrists, and cut and bruised their foreheads and eyes. Others received their weight upon their feet, and dislocated their ankles. Everyone remained senseless and motionless till born away by their friends.—*Dover paper.*

Lead.—Mr. Tod, in a late Speech in Congress, stated that in the vicinity of the Mississippi and Missouri rivers, there are miles in extent, where, take up earth without selection, and 100 pounds of it will produce more than 80 pounds of lead, with fuel at hand in abundance.

Colonel Theodore Lyman, Jun. of this city, has been elected Brigadier-General, vice General Sullivan, resigned.

A man named O'Donnan publicly and solemnly notifies the bank of Kentucky that, if they do not take the depreciated currency of the State in payment of their demands on him, they shall never get a dollar of principal or interest; and at the same time he informs all executioners of the law that, if they attempt to serve any process on his person, he will, as "soon thereafter as he can put a period to their earthly career."

A woman in Pennsylvania, in a fit of insanity, lately cut off the head of her infant, only 17 days old. On being inquired why she had done it, she replied—"I had to do it," and repeated the words at the Coroner's Inquest.

STRAW CUTTERS:

One of the Farmers best Implements, this season.

ON hand and for sale at the AGRICULTURAL ESTABLISHMENT, No. 20, Merchant's Row—Hand and Machine STRAW CUTTERS, some very low prices.

One ENGLISH MACHINE, which will be sold for half the cost and charges.

Several HAND MACHINES, suitable for private stables. Boston, March 1.

PRICES OF COUNTRY PRODUCE, &c.

THE FARMER'S LOT.

Sweet is the farmer's humble lot,

Unknown to anguish, care and strife,

Happy and peaceful is his cot,

He glides adown the hill of life;

To him that vale is spread in flowers,

And grac'd with amaranthine bowers,

And pleasure and delight are there,

And dove-eyed joy with laughing air.

How sweet to roam at glittering dawn,

Adown the violent-spangled glade,

A diamond sea on every lawn,

A tuneful choir in every shade;

And fleecy clouds of purple dye,

Flitting athwart the vermeil sky,

And hills in emeraldine vests,

And wrapt in gold their flaming crests.

O! let me ever, ever dwell,

From vice and folly far away,

And roam along the woodland dell,

And tune my rustic roundelay;

And when old age with soft decay,

Steals the rose of youth away,

Then let me press the cypress wreath,

And sweetly sleep the sleep of death.

False Liberty.—In the work of James I, entitled "True Law of Free Monarchy," it is laid down that a free monarchy is one in which the monarch is perfectly free to do as he pleases.—We have heard of another friend to freedom, who carried his ideas of liberty still farther than this wise prince. "Liberty," he said, "consists in my having a right to do what I please, and to make every body else do what I please to have them do."

Disadvantages of a scattered population.—Emigration spreads mankind, which weakens the defence of a nation, and lessens the comfort of living. Men, thinly scattered, make a shift, but a bad shift, without many things. A smith is ten miles off: they'll do without a nail or a staple. A taylor is far from them: they'll patch their own clothes. It is being concentrated, which produces comfort and convenience.

Advantages of Family Connexions.—Every man who takes an active part in the concerns of this world has need of friends. If he has to find them, and prove them, half his life is spent before he knows that they can be relied on. Relations are, generally, a man's friends, to whom, when in real distress, he will resort for assistance, notwithstanding family differences may have raised temporary barriers against the courtesies of friendship. An old lawyer, who had much experience in making wills, declared that, after people had deliberated long, and thought of many for their executors, they settled at last, by fixing on their relations. This shows the universality of the principle.

Description of a Book.—You might read half an hour and ask yourself what you had been reading: there were so many words to so little matter that you might as well undertake to extract sun beams from cucumbers, as to obtain the light of intellect from such a mass of opacity.

A Good Conscience.—How sweet the slumbers of him who can lie down on his pillow and review the transactions of every day without

condemning himself. A good conscience is the firmest opiate. The Materia Medica cannot supply one half so efficacious and pleasant; and all the nabobs together, if they were to unite their fortunes in one general contribution, could not purchase a similar one.

Genius.—Every man of common organization has the power of becoming a man of genius, if to this be added, a solitary devotion to art, and a vehement passion for glory. It is the capacity of long attention which, in the present day, must make one man superior to another.

To make Size from Potatoes.

One of the beneficial uses of potatoes, not perhaps generally known, is, that the starch of them, quite fresh, and washed only once, may be employed to make size, which, mixed with chalk, and diluted in a little water, forms a very beautiful and good white for ceilings. This size has no smell, while animal size, which putrefies so readily, always exhales a very disagreeable odour. That of potatoes, as it is very little subject to putrefaction, appears, from experience, to be more durable in tenacity and whiteness; and, for white-washing, should be preferred to animal size, the decomposition of which is always accompanied with unhealthy exhalations.

From the Baltimore Morning Chronicle.

THE MECHANIC.

There is no condition in life better calculated than that of a laborious mechanic, for a man to feel and realize a proper sense of his own dignity and independence. He retires to his meals from the fatigues of the day, with a full conviction that his sturdy hand has earned the refreshments of his table. He feels that his wealthy neighbor cannot enjoy even his opulence without his assistance. His time never hangs upon his hands; and his robust frame and his hardy sinews attest how essential this exercise is to the health of his body. He progresses onward, as it were by inches, to competence; and he learns the practical lesson of economy and frugality in his family expenditures. Removed from the vice and gorgeous temptations of a fashionable life, he knows how to bridle his ambition; he feels the blessings of the family hearth, and can look without a sigh on the gaudy pageantry of the day. This is a true moral independence—this curb on our unruly desires, this temperance in the exercise of all our wishes, are the very materials that constitute valuable citizens. It should be the pride, as undoubtedly it is the right of a laboring man to indulge in such ideas. Boys that are put out as apprentices to mechanical profession are taken many times from a state of poverty and ignorance, and prepared for fulfilling afterwards honorable stations. If they would but properly comprehend the full extent of such benefits, they would see nothing but their future honor, dignity and independence in their own indentures. They are learning, not as they are too prone to believe, the alphabet of servitude and degradation, but the rudiments of faith, and industry, punctuality, economy, and all those virtues that decorate and adorn the family hearth. They are now giving pledges to their masters of what their future character will be, when they, in their

turn, will be called upon to perform their part on the grand theatre of human life. It is a noble sight, and one of the best symptoms of the long continuance of our free republican institutions, when we behold apprentices alert, vigilant, and industrious, prompt to learn and zealous to excel. They may hear of naval and military glory; but theirs is a glory more permanent. The State calls but here and there and now and then, for heroes—this is only during the period of carnage and war, of butchery and of blood. The glory of a laboring man is connected with all that is dear in human life—it is identified with peace and contentment, with the early smoke that arises from the family cottage, with the bleat of the merle flocks, with the ripening harvest that seems nod as if impatient of the sickle. These triumphs are not won by blood and carnage; these are pacific victories, and let it be remembered that the Saviour of the world is called the Prince of Peace.

Mr. Thomas Jeffreys, of Melksham, Wiltshire, (England,) gave a dinner on Tuesday the 29th ult. to 22 of his neighbors, all residing in the aforesaid parish, whose ages together amounted to 2000 years. The hard winter, which began on Christmas Eve, 1739, was very familiar to many of the company, and some well remember the ice to have been more than a yard in thickness in many of the ponds in the vicinity.

Cursing according to Law.—Some years since when a scarcity prevailed in Connecticut, a poor man by the name of Crocker, went to a rich farmer whom he knew to possess a surplus of Indian corn, and tendered him the highest price for a bushel of it; but the farmer refused to sell, pretending that he had none to spare, whereas, it was evidently false; and that he only hoarded it up for the present, as some rich men do, to starve buyers into the necessity of giving them the extortionate price they wish to take. Upon this, Crocker gave him his full character in which it seems, he did not take the name of God in vain. However, the farmer immediately arraigned him for abuse, before one Justice Hyde, and when our pauper was called to answer to the charge, and make his defence instead of attorneys and law books, he produced only a bible, (for bibles were then regarded as valuable,) and read a passage which says, "Cursed is the man that withholdeth corn from the poor, and the people shall curse him." Here he guessed that he had done no more than what he had authorised and expressly commanded; turning to the old Gripus who had prosecuted him, said, "God curses you! and I curse you. Do you curse him too, Esquire Hyde, for on your curses is worth two of mine!"

A gentleman complimented a lady on her improved appearance. 'You are guilty of flattery,' said the lady. 'Not so,' replied the gentleman, 'for I vow you are as plump as a pidge.' 'At first,' rejoined the lady, 'I thought you guilty of flattery only, but now I find you are actually making game of me.'

He that will not reason, is a bigot; he that cannot reason, is a fool; and he that dares not reason, is a slave.

No. 32.

DISEASES OF CATTLE.

SELECTED AND COMPILED FROM THE BEST AUTHORS,
BY THE EDITOR.

Grain Sick.

The first symptoms of this disease are a dull, heavy appearance of the eyes of the animal; it frequently shifts about from one side to the other, and when let loose, or driven about, complains very much. On examining her, a fulness may be perceived betwixt the hip and ribs, on the opposite side to the milking one, if pressed with the hand; this fulness will be felt to resist in the extension of the stomach. As the disease advances a loss of milk ensues, and a total dislike to any food.

This disease is caused by a surfeit of grain, and its remedies are bleeding and purging; the first to relieve the urgent symptoms, the second to remove the cause of the malady. The quantity of blood, according to Dr. Skellet, should not be less than from two to three quarts; but he prescribes for large cows, in the vicinity of London, perhaps a smaller quantity would be preferable for animals of but middling size.—The purging drink recommended by the same author is as follows:

Sulphur from 8 to 12 or 16 oz. proportioning it to the strength of the animal.

Nitre, 2 oz.

Turneric or Cummin seeds, of each 1 oz.

When this has operated in unloading the stomach, the weakness of that organ, the loss of appetite which ensues, and the deficiency of bile connected with it, will be repaired by decoctions of an aromatic and bracing nature, such as coriander, ginger, aniseed, &c. Diluent broths and mashes form the proper food for some days.

Strains and Bruises.

When these accidents occur in a considerable degree, or if an important part has been injured, bleeding is highly proper. As inflammation is the common effect of these injuries, fomentations are at first the most proper applications; and, when the inflammation has subsided, the ointment recommended for swollen udder* may be rubbed on the part two or three times a day. When any part of the limbs has been strained, as to occasion lameness, if the lameness continues after this plan has been tried, it will be advisable to have recourse to a blister, which will be found more effectual than the most celebrated strain oils.

In slight bruises from the pressure of the udder, or other causes, the following lotion is effectual:

Goulard's extract ½ oz.

Vinegar 4 oz.

Water 1 pt.

Mix. [White's Treatise.]

Warts, or Horny Excrescences.

These are affections of the skin which in cows do not go deep; they destroy the roots of the hair, wherever they form, and are of a firm and horny texture, and readily give way when pulled or roughly handled, which occa-

sions them to bleed, and shows their connexion with the vessels of the skin. They readily yield to emollient ointments, particularly to goose grease, which should be frequently rubbed on them till the excrescences fall off.

Swellings on the Joints and Bones.

Swellings on the joints and bones are generally very painful to the touch, attended with inflammation and fever. If the swelling comes on suddenly, and its increase is rapid, it generally terminates in suppuration. If situated on the joint, a discharge of the liquor of the joint, or joint oil, is the consequence, which is dangerous and troublesome to cure. On the contrary, if the swelling comes gradually, with little pain, and a hard callous substance is felt, and if early attempts are not made to stop its progress, it will end in a stiff joint, and all attempts to cure it will be in vain.

This disease generally proceeds from kicks or blows with stools, &c. or violent strains.

When the swelling comes on rapidly, with much pain and inflammation, bleeding and purging should be immediately resorted to. The purge should be as follows:

Epsom salt 1 lb.—Nitre 2 oz.—Ginger 2 oz.

Fomentations should be applied twice or three times a day. The following is recommended by Dr. Skellet:

Take of Wormwood and Southernwood, of each, two handfuls,

Poppy heads, four or five handfuls,

Elder flowers, a handful,

Commonile flowers, 4 oz.

Bay and Juniper berries, of each, 1 oz.

Crude Sal Ammoniac and Potash, each 2 oz.*

Boil these materials in four quarts of spring water, till reduced to three. Then foment the swelling with flannels, as hot as possible, for a quarter of an hour or more; after which, the flannels are to be bound over the part till the time of fomenting again. This operation may be repeated for two or three days, at which period the inflammation will probably be on the decline, when the following method must be adopted.

Take of Spanish flies in fine powder, 2 dr.

Spirits of Ammonia 4 oz.

Mix together, and rub a little of the mixture into the part affected; after which a flannel roller is to be slightly put on, and kept on till a profuse discharge or blistering takes place, which will form into a crust, which should not be rubbed off.

If suppuration has already begun, or the disease so far advanced that it cannot be avoided, it should be brought to a head as soon as possible; after which the following balsam may be applied once or twice a day.

Take of compound tincture of myrrh 2 oz.

Blue vitriol water ½ oz.

The vitriol water may be made by dissolving ten drachms of blue vitriol in powder, in a pint of hot water; the balsam to be well shaken to-

*No doubt a part of these materials only, might answer a good purpose, and should be applied when all cannot conveniently be obtained.

gether previous to using it. Should there be any discharge of the joint oil it may be necessary to proceed as hereafter will be directed under the head *Loss of Joint Oil*. When the scarf falls off, which the blistering has produced, and there remains any lameness, the following plaster should be applied.

Take of black and Burgundy pitch 1 lb.

Oxyroceum and Paracelsus 4 oz.

Ble Armenian and Dragon's blood 2 oz.

When this swelling comes on gradually with little pain, and is of a hard, callous, or bony nature, fomentations will be of no use. But the hair should be first cut off the part affected, and some of the under mentioned blister rubbed well into the swelling with a knife or spatula; and it may be repeated for two or three successive mornings, or till a plentiful discharge is produced.

Take of quicksilver 1 oz.

Goose grease 2 or 3 dr.

To be rubbed together in a mortar till the quicksilver is completely killed; then add the following in fine powder.

Take of Cantharides 2 dr.

Sublimate 1 dr.

Oil of Origanum 2 dr.

Marsh mallow ointment 2 oz.

Goose grease 1 ½ oz.

Tar 2 oz.

Oil of vitriol 1 dr.

Spirits of ammonia 1 oz.

Mix all well together.

After this operation, and the scarf had fallen off, if there should remain any hardness, and the animal is still lame, the blister may be repeated, which seldom fails to produce a perfect cure. If the animal seems weak in that part, after the above process, which is sometimes the case, the plaister of burgundy pitch, &c. before recommended, will be proper, in order to strengthen it.

Soft Swellings.

From bruises and other accidental injuries in getting up and lying down, cows are subject to soft or oedematous swellings of the joints, which are without any pain, heat or inflammation. They enlarge often to a considerable size, and yield readily to the pressure of the finger.—Though this complaint is never attended with danger, it is troublesome to the animal from its size, and even difficult to remove, if it has been of long continuance. Its management depends on making an opening into the swelling in the first instance, which may be done by running a hot iron into the lowest or most depending part of it, making two or three openings in this way where the fewest blood vessels are situated; and this operation requires particular caution, that the discharge may gradually come away, and that no vessels may be injured, from the danger of producing an internal hemorrhage, which would occasion a new increase of swelling and inflammation, instead of lessening the disease. When the openings into the swelling are properly made, and a gradual evacuation takes place, then the orifices are to be plugged

* See N. E. Farmer, No. 30, p. 233.

up, within twenty four hours, with a caustic composed of a small quantity of corrosive sublimate, in powder, placed on tow, which is to be first wetted, that the powder may adhere to it. The effect of this will be to cause a sloughing of the coats of the swelling, when a core to a certain extent will be brought out, by which means a suppuration will ensue, and the swelling be gradually reduced during its progress. The swelling is to be rubbed at the same time with the following mixture:

Linseed oil	3 oz.
Oil of turpentine	2 oz.
Oil of vitriol	1 oz.

Though the parts never regain entirely their natural size, yet by these operations, the animal will be enabled to move the joint without any inconvenience. After the wounds are healed, the remaining callous or swelling should be blistered two or three times, in order to make the joint more pliable. The blister most proper for the purpose is composed of Spanish flies and spirits of ammonia, as directed under the head "Swellings on the joints and bones."

Skellet's Treatise.

ORIGINAL COMMUNICATIONS.

TO THE EDITOR OF THE NEW ENGLAND FARMER.

In No. 30 of your paper, is a letter from Mr. J. Kenrick to Mr. Pomeroy, in which he again notices my observations on the best time for felling trees for timber; and thinks them "substantially correct," with one exception, where I say "the larger the grain the harder and stronger is the wood."—On this he remarks—"From my own experience I certainly know that coarse grained wood, though heavy, is brittle, and far from being the strongest." He adds, that wheelwrights will say, "that coarse grained wood is unfit for spokes or carts, and too brittle for pin-wood;" and he affirms, "that the strongest timber will always be found in a medium between the coarsest and the finest grained."

Mr. Kenrick's views and mine appear to be the same—so to manage timber trees as to render them most useful; and to select the fittest for the several objects to which they are applied. He appeals to his *experience*, the proper basis for reasoning on a disputed point: but to make it the test of truth, all the circumstances must be alike. If Mr. Kenrick will look again on my essay, he will see the importance I attach to the *age* of timber trees; that there is a time when they attain *maturity*, or *full age*, at which they may probably continue stationary for some years; but if left standing many years after their full age, that the toughness and strength of the wood are greatly impaired. The coarse grained wood which Mr. Kenrick pronounces to be brittle, I should suspect as falling under my own restriction—whose toughness and strength were impaired by age.—To make a fair experiment, select trees growing on the same soil; count the grains to find trees of the same, or nearly the same age; the grains of one coarse of another fine, and a third at a medium between the former two. From the butt end of each, take pieces of the same age (by counting the annual rings from the heart) and dress them to the same size—say an inch square and two feet long: rest their ends equally on supporters, and at their central distances between the supporters, hang on weights, increasing them

gradually until the pieces severally break. Their strength, then, will be in the proportions of the weights they sustain. I have not a shadow of doubt that the largest grained will prove the strongest wood.—This experiment, I am aware, will require some time and care, to render it satisfactory; but not more, I hope, than Mr. Kenrick may have leisure to bestow upon it. In the mean while, I take leave to offer two or three things for his consideration.

The same tree, from its butt to its top, will furnish all degrees of the grain, from the coarsest to the finest. Let him dress out as many pieces as he pleases, to the same dimensions, say at every two or more feet of its length, from its butt upward; and then by weights suspended as above mentioned, see which are the stronger. I think I run no hazard in saying, beforehand, that they will be found decreasing in strength, as the grains lessen, from the butt upwards.

Again—cut off the extreme end of a limb of an old tree (say an apple tree, such as he has often pruned) where it is an inch in diameter; and at the same time cut off a young shoot, of the same diameter, springing from the trunk, or a large limb, of the same tree. In the latter he may count perhaps five grains—in the former, twenty or more. The piece of the old limb he knows will be found extremely brittle; but the young shoot very tough and strong. Mr. Kenrick must also have noticed the much greater strength of the extreme ends of the limbs of young trees, compared with the extreme ends of the branches of old trees—supposing both to have sprung from the seeds, and to have remained ungrafted.

What causes the striking difference in strength (which I here take for granted) between the butt cut and the higher portions of the stem of the same tree? what but the greater quantity of woody fibre in one than in the other?—A transverse cut of the butt, viewed with a microscope, would exhibit a large portion of solid matter; a like cut far up the stem, a bundle of pores connected by very thin layers of wood.

It just now occurs to me, that Lord Kaimes, in his "Gentleman Farmer," mentions the ages of trees when in their proper state for timber. He wrote, in Scotland, this valuable work, about the year 1772. Great improvements in British husbandry have been since made. In his chapter on the culture of forest trees, after directing the manner of making plantations, he treats of the grown wood. "I begin (says he) with examining at what age a tree is in perfection for the purposes of a farm. At the age of sixty, it is sufficiently large for every farming purpose; being, when cut to the square, from twelve to fifteen inches each side. I must except the oak, which even for the purposes of farming, improves till it be one hundred years old. Every oak consists of red and white wood; the former the firmest of all wood, the latter [the sap wood] good for nothing. Ash, after the growth of sixty years, turns brittle."—I am inclined to think the American white-oak (which appears to be very different from the oak of Great Britain) and ash, not only continue to grow, but to retain their strength, to greater ages. I am also disposed to believe that the "coarse grained wood which Mr. Kenrick and others have found to be brittle, had passed the age of maturity, and entered on the first sta-

ges of decay. At still greater ages, the wood of trees becomes more and more brittle; and at length they fall. In this way, whole forests of aged trees perish and disappear, and are succeeded by new races, sometimes of the same sorts of trees, but often of totally different kinds.

In the same letter, Mr. Kenrick mentions his practice in pruning trees (fruit trees, I presume, apples and pears especially) in June; and is satisfied that the only proper time for pruning is while the bark will peel, in June or July.—But being then full of leaves, it must be more difficult to see where to prune, than in early spring, before the buds open. My own practice has been to prune in the spring, beginning when the buds have scarcely begun to swell; and ending before the expansion of the leaves. But I never leave "stumps" of limbs. Every branch that is taken away, is cut close and even with the stem or the limb where it grew; and the healing of the wound commences and proceeds kindly as vegetation advances. If the branch cut off be large, the wound should be covered with some kind of plaister. The fine orchard in Newton known to Mr. Kenrick fifty years ago, was doubtless pruned with axe leaving stumps from two to four or five inches long. The sap, in such cases, will endeavor to climb up, and will ascend part of the way, but cannot reach their tops. These exposed to the damp air and rains, at length rot, and produce general decay. The saw is essential to correct pruning.

T. PICKERING.

Salem, Feb. 21, 1823.

FOR THE NEW ENGLAND FARMER.

Mr. Editor—While you are so laudably engaged mending the breed and condition of our domestic animals, I have thought it might not be amiss to submit to your disposal some remarks in the wish of improving the health of the great biped who superintends not only the field and the barn, but the house and its inmates.

ON DRESS, OR CLOTHING.

In devising the means of promoting and securing our physical well being, it is the business of art to counteract the irregularities of nature; to modify principles, and to supply expedients, so as to meet the emergencies of particular cases.

It is said by some persons that they wear the same clothes all the year round, implying, with a good deal of self-complacency, that they have discovered a better rule of conduct in this case than others have been able to adopt. They would, however, be quite as much wisdom in man's saying that he would have a fire of the same size, in his parlor, during every day of the year, or, that he would have no fire in any day of the year.

In our climate, which is at once variable and extreme, to suit one's clothing to our fluctuating seasons, requires no little care and attention.

From too light a dress in winter every observer must know that many young ladies, in particular, take cold, and thus lay the foundation of fatal consumption.

No degree of cold, which is at all painful can long be endured with safety.

The first requisite of a winter garment is that it be sufficient to keep us warm; and the first requisite in summer is, that it occasion a little superfluous heat and weight as possible. And at all times the entire dress should be s

ade as to leave the moving organs of the body perfectly free, so as to permit the great functions of health to go on without the least interruption from pressure or confinement. A dress that wants any of these properties cannot be informable to reason or the conditions of health. Now is it that a dress like this, so simple in theory, so easy in execution, and so salutary in its effects, has been so little esteemed and adopted? Fashion has been the great opponent. This perverse arbitress will not bear a division of authority, nor an equal in display. Whoever is for her, she is against. Unconditional submission is the only term of favor; and before she can be given, health and good taste must be renounced. But who shall be found of sufficient nerve to brave the sneers and contempt of the votaries of fashion?

We call ourselves a free people, but no man strictly free who does not in every thing, feel himself at liberty to obey the dictates of his head and heart, in promoting his own physical and moral health and happiness. I make these remarks on the freedom of action, because without a consciousness of possessing it, men cannot be elevated to any thing great or good. No man should believe that power and responsibility are equal; neither reason nor revelation cognizes any accountability beyond this.—We have liberty and power, and then you can convince them by motives; they may be persuaded that knowledge is good, and be incited to acquire it.

Knowledge will teach them that reason is a better guide than prejudice, that liberty is better than slavery, health than sickness, temperance than excess, &c. Now if this is true, I think it follows, that when health and fashion are opposed to each other, we should do well to prefer the former.

Many facts might be mentioned to show the influence of too much or too little clothing, in producing or increasing diseases of every kind, especially those which affect the lungs. The quantity of the clothing should be suited to the weather. Mr. B. told me that he twice had a fit of cough and spitting of blood, by wearing his summer clothes a week after the weather became cool in September. But it is not sufficient to vary the weight or quality of dress with the seasons only; it is also necessary to change it daily with the varying temperature of the air, even in summer, in middle latitudes. When the animal powers are languid, it is difficult to keep the extremities warm; whence women in Holland have recourse to a particular apparatus for warming their feet. But for this purpose, after suitable clothing and airing, the great expedient is *bodily exercise*. There is, however, no comparison between a pair of clothes in cool rooms, and a light dress in hot ones, where these circumstances only are to be taken into the account. Those who follow the former usage will escape numberless diseases, to which the followers of the latter will be subject.

The inhabitants of Holland, and the English who have resided long among them, are forcibly struck with the coughs, both catarrhal and consumptive, so universally prevalent in England, at almost every season of the year. At church and at the theatre, devotion and pleasure are alike interrupted, and sometimes totally destroyed by incessant coughing and expectora-

tion; while in the largest assemblies in Holland, instances of a similar kind are hardly known. This striking difference may be ascribed to the contrast observable between the two countries in the construction of their habitations, and in the peculiarities of their dress. The Dutch apartments are cool, and their clothing warm. A Dutch woman feels herself insufferably oppressed in a room which an American or English woman would deem but moderately warm. It seems to be a fair inference that a formidable portion of the unhealthfulness and mortality in England and America depends precisely on the effect of our opposite customs in regard to clothing and lodging. How far the following description of a fashionable dress, from an English physician, may be applicable to the females in the larger towns and cities of our own country, I leave every one to decide for himself.

"Many women in the morning muffle themselves up to the chin and ears, and go about half naked all the evening, braving disease and death. The cold of our climate is sufficient annually to cut down thousands of females, who having been tenderly brought up, will not guard themselves by adequate covering against it.—But the ladies are not content with the havoc committed in this manner. Among death-bed confessions I have sometimes heard of a practice of *damping* the cobweb garments, which would otherwise hang about the limbs too loosely. By this means the killing rigor of an inclement atmosphere, is most materially assisted. The desire of obtaining a celebrity, equal to that of some monuments of ancient art, which have lately been transferred to Paris, appears to me quite as good a reason, for risking life, as many of those which have conferred mortality on the adventurers. But the beautiful followers of the *attitude* or *statue* fashion unfortunately do not stiffen into figures, like the Venus de Medicis, or like what they themselves would be in good health. The state to which they are often reduced, is one from which every body turns away with horror, except the stealer of dead bodies and the dissector."

I will close with one word on the use of flannel. This article should never be worn so long as linen or cotton is sufficient for warmth, and when it is put on by day it should be taken off at night. It is useless by night, and in this way it is a far better defence and security by day.

But is all judgment and taste to be sacrificed to health? No; there will still be sufficient scope for these, after the provisions for health are made. Colors may be suited to the complexion, the form of the garment to the shape of the wearer, expense to revenue, and the whole style of dress to the character and condition of individuals.

TO THE EDITOR OF THE NEW ENGLAND FARMER.

DEAR SIR,

I received your paper, and am greatly pleased and amused with the spirit of improvement that seems to have awakened the American farmers, &c. I find that several have written on the mode of preserving Bacon. I have my way which I will offer. It is to rub the legs over with a small quantity of salt and salt petre the night after the hogs are killed (if I can.) Then I make a pickle sufficient to cover all the legs, and boil and skim it till it is cleansed of all the scum that will rise. Then

for every twenty weight, I add one ounce of good double refined salt petre, and half a pint of molasses; scald and skim that in the brine, put it by, and let it cool, then pour it on the legs sufficient to cover them. When they are impregnated with the pickle, then smoke or dry as suits the taste. I dry the legs, and smoke the meat tub with coals. When there is danger of flies, I put my meat back into the tub, and scald and skim the pickle, cool and put it on the bacon legs. They will keep sweet and fresh without rust, or tasting rancid or strong at a year old. The same pickle is good for pork, and will preserve the lean part good. It is also excellent for beef, but it should be put on that boiling hot. I have used the same pickle for about thirty years for all my meat, which I boil and skim, and make the additions of salt petre and molasses. WALLIS LITTLE.

Townsend, Feb. 22, 1823.

From the American Farmer.

THE HAMPTON DAIRY.—Near Baltimore

We have been kindly permitted to take from the farm register the following account of sales of butter from Gen. Kidgely's dairy, at Hampton, in the year 1822.

January,	319 lb.	sold at market	\$413 64
February,	402	do.	169 67
March,	331	do.	171 31
April,	334	do.	165 50
May,	315	do.	118 96
June,	443	do.	127 19
July,	490	do.	147 50
August,	453	do.	159 90
September,	272	do.	126 98
October,	267	do.	129 53
November,	252½	do.	131 81
December,	291	do.	138 34

4296½ lbs. sold, average
41 cts. per lb. \$1763 23
800½ used in this year.
56½ given to Mrs. Onion.

5213½ lbs. made this year.

Sold ten veal calves for \$55 00

Native Race of Cattle.—Mr. ASA RICE, jr. of Shrewsbury, in Worcester county, has brought to the Brighton Market the following Cattle, all of his own raising and fattening, weighing after being slaughtered, as follows:

A Steer, 4 years old, Feb. 10, 1821, slaughtered on the 11th Oct. same year, 1519 lbs.; Slaughtered Feb. 2, 1823, a Steer, 4 years old, the 12th April, 1531 lbs.; Feb. 2, 1823 a Cow, 13 years old last Spring, 1091 lbs.; Feb. 2, 1823, a Heifer, 3 years old the 14th May, 911 lbs.

These cattle were wholly of native breed. The Steers were weaned at 12 weeks old, and fed with nothing but hay and grass until they entered their fifth year. The Cow brought a calf at two years old, and every year since but the last.—She was milked last winter, turned out in the spring, thin in flesh, and began mealing the 1st of October last. The Heifer brought a calf at two years old, and another last spring; and was dried the last of July, and turned out, as thin as any other cow; and was fatted on account of a blemish which would eventually have spoiled her.

REMARKS

ON THE IMPROVEMENT OF CATTLE, &c.

In a Letter to Sir John Saunders Schright, Bart. M. P.
by Mr. John Wilkinson, of Lenton, near Nottingham.

Let each succeeding race employ your care,
Distinguish which to slaughter, which to spare;
Mark well the lineage,—let the purest make,
From purest blood, its just proportions take.

Having read, sir, your valuable treatise on the improvement of live stock, in a letter to Sir Joseph Banks, that great patron of all science; I have taken the liberty to enlarge upon some of your observations, and to offer to your consideration such fresh matter as appeared to me of importance to the subject. And this I have been encouraged to do, not only on account of the great pleasure you always take in questions of this nature; but also, because many of your assertions are corroborated by my own experience.

It has always occurred to me, that in order to understand the true art of breeding, we must have recourse to the first principles; and that it will be easier to show how any improved breed may be continued, when we have previously shown how it was first formed.

In the following remarks, I shall confine myself chiefly to neat cattle, as being that species of animal with which I am more particularly concerned; but it will be easy to perceive that the observations there advanced, will be applicable, in a greater or less degree, to every other kind which is destined to be the food of man.

Whether the different breeds with which we are now acquainted, descended originally from one common stock, the wild Bison, is a question, I think, hard to be determined. Of this however, we may be assured, from the very nature of the case, that the distinct breeds at first, if more than one, could have been by no means numerous; so that the great variety which we behold at present, is owing to food, to climate, or to other collateral and accidental circumstances. And perhaps of all the causes contributing to this multiplicity, none would be more effectual, than the hidden springs of nature itself.—For though we perceive that there is a *strong* tendency, for like to produce like, as it is usually termed; yet he that is at all conversant with nature, must perceive also, that there is a *certain* tendency to change. And this law of nature would soon be assisted by man, who is ever fond of novelty; and delights in diversity, even for its own sake.

Thus then, we have seen, that distinct breeds might readily be formed by the joint efforts of nature and of art; nor will it be more difficult to perceive how they might afterwards be improved. That all would be capable of improvement is too obvious to need discussion. For no one can behold any breed whatever in its more natural or less improved state, without perceiving a great variety in the shapes of individuals, their different degrees of tendency to feeding, or certain other remarkable properties, which might give to some a decided superiority over the rest. These, therefore, must be selected from the whole herd; and as you yourself, Sir, have remarked, the male and female be properly matched. When we come to this progeny, some will probably be worse, some equal to, and some even better, than the parents them-

selves. The worst must unquestionably be rejected, while the rest, and especially the best of these, are carefully to be preserved for future stock. And thus by a judicious selection of male and female, and discarding every thing that is refuse, we must continue to proceed. And by such procedure, animals have at length been produced, so different from the generality of the stock from whence they were originally taken, that none but such as are well acquainted with these matters, could have any idea, that there existed between them the least affinity. The distinction indeed between some, and their own particular variety, has scarcely been less, than the distinction between that variety and the whole species. The longer also these perfections have been continued, the more stability will they have acquired, and the more will they partake of nature itself. As to the leading properties which may constitute the excellence of any breed, or of any particular family belonging to that breed, I shall next inquire.

And first with respect to form; in which case I shall give, what I conceive to be the most important points for the true symmetry of Neat Cattle in general. These are as follows.

The head ought to be rather long, and muzzle fine; the countenance calm and placid, which indicates a disposition to get fat; the horns fine; the neck light, particularly where it joins the head; the breast wide and projecting well before the legs; the shoulders moderately broad at the top and the points well in, and when the animal is in good condition, the chine so full as to leave no hollow behind them; the fore flank* well filled up, and the girth behind the shoulders deep; the back straight, wide, and flat; the ribs broad, and the space between them and the hips small; the flank full and heavy; the belly well kept in, and not sinking low in the middle; the whole forming not a round or barrel like carcass, as some have expressed it, for this would leave a deficiency both in the upper and lower part of the ribs: the hips globular, wide across, and on a level with the back itself; the hind quarters, that is from the hips to the extremity of the rump, long and straight; the rump-points fat and coming well up to the tail; the twist wide, and the seam in the middle of it so well filled, that the whole may very nearly form a plane, perpendicular to the line of the back; the lower part of the thigh small; the tail broad and fat towards the top, but the lower part thin; the legs straight, clean, and fine boned; and when the animal is in high condition, the skin of a rich and silky appearance.

Those appear to be the most material points for the formation of true symmetry in Cattle; there are others of minor consideration, which will readily be suggested by attention and experience; but I did not think it necessary to mention them here.

Many of the most important of the foregoing properties, may be expressed in the following stanzas, as descriptive of a beautiful Cow: and

* The fore flank is the lower part of the side immediately behind the fore legs.

† Perhaps the nearest description that can be given, of the carcass, would be to say, that a section of it (made by a plane passing through its middle, in a direction perpendicular to the line of the back) ought nearly to resemble an oval, whose two ends are of the same width, and whose form approaches to that of a circle; or (to those who understand the nature of the figure) an ellipse, whose eccentricity is not great.

since verse is frequently found to assist the memory, I have therefore inserted them thus:

She's long in her face, she's fine in her horn,
She'll quickly get fat, without cake or corn;
She's clear in her jaws, and full in her chine,
She's heavy in flank, and wide in her loin.

She's broad in her ribs, and long in her rump,
A straight and flat back, with never a hump;
She's wide in her hips, and calm in her eyes,
She's wide in her shoulders, and thin in her thighs.

She's light in her neck, and small* in her tail,
She's wide in her breast, and good at the pail,
She's fine in her bone, and silky in skin;
She's a Grazier's without, and a Butcher's within.

Should any difficulty still remain in forming clear conception of the points described, think in such a case, I may very safely recommend a Print which I published a short time ago, and that too, without vanity; as it reflects far more credit on the artist, than on myself. In such a recommendation moreover, I feel the greater confidence, both because I was requested to publish it by many of the first agriculturists in the kingdom: and since published, it has met with their highest approbation. This print consists of a groupe of five animals, so arranged as to show the just proportion and proper symmetry of every essential part. The Portraits were taken from the most perfect animals in my possession; and the Engraving, which is in a style far superior to that in which Cattle are generally executed, was finished with the greatest care. And if I am correct in my description for the proper formation of Cattle, and the portraits in the above mentioned Print also good; I think he who carefully compares the Portraits with the description itself, cannot long fail of being at least a very tolerable judge. For any one reading the description of a particular part, as for example, of the breast; will there find, that it ought to be wide, and project well before the legs; and on turning the Print, he will immediately see this projection shewn in the side view of the Bull, and the width in the Heifer which faces him: and so on, with respect to every other part. Inasmuch as each animal is placed in a different position from the rest, there is no important point which is not fully presented to the view.

In the description which I have given of the formation of Cattle, I have said that the carcass ought not to be round or to approximate to the form of a barrel, as some have described it; and have offered a sufficient reason why it should not be the case. Whoever indeed takes such a form for his model, would quickly be told by a judge, that the animal was not described enough in its sides. I have, moreover, described the countenance as calm and placid, instead of speaking of the boldness of the eye; the reason of which will easily be discovered by the person of your singular penetration. For the boldness of the eye is frequently caused by a restless or vicious disposition; but a quiet and a docile look denotes evenness of temper, so essential to quick feeding. And we have often to consider the nature of animals in general, perceive that this quiet disposition which I have been describing in Cattle, and which in Man might be termed indolence, has a strong tendency to make the eye appear small, rather than

* This epithet alludes to the lower part of the tail only, the higher part ought to be broad, according to the former description.

old and large. Let any one for instance, observe another whose mind is at rest from attention to outward objects; the muscles of the eyes relax and the lids themselves come closer together, in which case, the eye necessarily assumes a smaller appearance; and the contrary takes place when our attention is again excited. must remark however, that an animal which possesses naturally every essential for quick feeding, and whose countenance indicates that disposition by the mildest appearance, may have its appearance altered by ill treatment or other accidental circumstances. I observed that the lower or bony part of the tail ought to be thin, but the upper part broad. The tail has so often been designated by the former appellation only, which is incorrect in the description of a good animal. For on the upper part of the tail of one that is in tolerable condition, there ought to be a considerable quantity of fat; but as the lower consists chiefly of bone, it ought to be thin; and will always be so, when the animal itself is a small boned one. Perhaps some may think, that the two latter observations, namely, with respect to the countenance and the tail, are but of little consequence; since however, these signs generally accompany a good animal, they ought not to be passed over; the latter is an invariable attendant; and the former naturally so, but may sometimes be altered by adventitious circumstances, as has already been observed. It is one thing to be able merely to distinguish in the gross between a good and a bad animal; but another and a far more difficult one, to be able to point out every defect however trifling, and to discover every excellence. And yet no man can arrive at any great degree of perfection in the art of breeding without making this latter kind of knowledge his chief aim and most ardent study.

Some breeders have asserted, among whom as Mr. Bakewell himself, that a disposition to get fat was necessarily combined with a shape similar to that I have been describing. The truth of this may very justly be questioned; and the examples so well chosen by yourself, prove that the above mentioned properties are not invariably found together. Had they said with you, Sir, that "this particular formation generally indicates a disposition to get fat," they could have been borne out in the assertion by the fact itself: for it must be observed, that it is one thing to say, that two qualities are necessarily combined in the same subject; and another to say, that they are invariably found together. And if this latter term would have been too strong for the occasion, and that it would, we have already seen; how much rather ought the former to be rejected? It is frequently no easy matter indeed, to determine whether two qualities are necessarily combined; nor in the question before us, is it at all necessary. For if quickness of feeding generally accompanies this peculiarity of shape (and that it does, it can never be denied,) that alone would surely be a sufficient reason for a preference to this form; to say nothing of its other and great advantages with respect to the weight of the animal, the laying on of the flesh in the prime parts, &c. &c. Perhaps these gentlemen have no design to mislead us, but were not sufficiently careful in the choice of their language. It is material however, that we should not only have clear ideas ourselves, but also, that we should convey

them to others in the most explicit terms. And in treating on any subject, we ought always to state things as they are actually found to be, and not as we might wish them. One satisfactory reason, I think, we may easily discover, why the best feeders are most frequently found amongst those animals, that at the same time possess the best shapes. For without making the former a necessary consequence of the latter; those breeders that had skill enough to select cattle of the most perfect symmetry, would also have skill enough to select out of these the best fleshed ones. For my own part, I would not keep an animal that had a bad quality of flesh, if the form were perfection itself. The observation which Dr. Jenner made to you, "that no animal whose chest was narrow could easily be made fat," is a fact borne out by almost universal experience; and I believe is satisfactorily accounted for on natural principles. For the chest being too narrow, there is want of sufficient room for the proper action of the internal organs.

The form that I have already described, is not only the best for affording the greatest weight to the animal; but the flesh is also chiefly laid on, in what is usually called, the prime parts.

I have just had occasion to speak of goodness of flesh, but how to describe this quality in any thing like adequate terms, is a thing extremely difficult.—Some persons of great experience, would very rarely be wrong, judging by the sight only. But the best method of discovering it, is by the touch; and it has a richness, a mellowness in the feel.

Here it may be very necessary to caution the inexperienced against a certain description of animals, usually called light fleshed ones.—And of these, there are too many in the hands of some breeders, not altogether destitute of eminence. The objection to such, is not on account of the quality of the flesh as regards richness, but the deficiency of its quantity when the animal is in a lean state. I have known such highly approved by some, when shewn to them alive and made very fat, but this has certainly been for want of better judgment; and had the same persons been able to distinguish between fat and lean, they must have drawn a very different conclusion. This kind is profitable, neither to the grazier, nor yet to the consumer. They are not profitable to the grazier; because in the first place, they are naturally tender—and moreover, they carry so small a quantity of flesh in their lean state, that they have much to do, when put to feeding, before they come to any tolerable weight. Neither are they profitable to the consumer; for fat without lean is of no other use, than to be wasted in the kitchen. Whenever they are found in the hands of a Breeder, it is generally in the hands of such as are in the habit of keeping their stock remarkably high; and when they are sold, and fairly kept as store stock, they bring a considerable loss to the purchaser, and disgrace on the original possessor. It is to be hoped indeed, that this kind of animal will soon be exploded in Neat Cattle, as it has been long ago in the new Leicester Sheep.* Of

* I have here been misunderstood by one gentleman, who supposed I was speaking against the breed of new Leicester sheep; whereas I was only speaking against a particular variety of this breed; namely, light fleshed

this we may be assured, whenever a stock is generally known to be of this description, the Breeder himself will soon fall into disrepute.

There is another kind which carry plenty of lean flesh, but of a bad quality. These are invariably slow feeders; and may always be discovered by the touch, the flesh being naturally hard. Some of these are so bad, that when put to the best keeping and continued at it ever so long, they will scarcely have a stone weight of fat, either within or without.

The perfection of breeding, as far as flesh is concerned, is a great quantity of rich lean flesh in the first instance, which when the animal is well kept, will soon be covered with a proper proportion of fat. And such not only take a shorter time in preparing for the stall than any other; but their beef will also sell for more a pound; being of the very first quality, and the kind that is eagerly sought after for the tables of our nobility and gentry. It is not here meant that this kind can never be made too fat; they may be very much so, this however can always be prevented by the time allowed for feeding.

In a word; it is not the animal which has scarcely any flesh, when at a store keeping, and which when fed, will consist almost of fat alone, which is the most profitable either to the grazier, or yet to the consumer; nor is it the animal, whose flesh is ever so abundant, if hard and bad, and incapable of having its proper quantity of fat; but it is that, which when at store pasturage only, carries a great quantity of rich lean flesh, and which by good keeping, may be made as fat as we please. And of these three sorts of animals, I think the first nearly as unprofitable as the second, notwithstanding the injudicious praise they sometimes meet with.

Having already treated on those two important qualifications, good symmetry with richness of flesh, I shall now controvert a hackneyed assertion, that a great tendency to feeding, is incompatible with a great tendency to milking. And here I shall observe first, that there seemed to be no reason to draw this conclusion before the fact was ascertained by experience, and secondly, that the experience of some in the present day proves the assertion untrue.

In the first place then, it may be remarked generally, that tendency and effect are two very different things; that a tendency may exist, when its effect is wholly or partly destroyed by some other counteracting cause, that when the effect of such counteracting cause can be removed, the other cause may be wholly productive. If it were assumed therefore (for I am now speaking independent of the experience I shall afterwards advance) that a cow, while giving a great quantity of milk, cannot possibly keep herself in good condition; because so great a portion of the food being converted into milk, the carcass could not properly be supported; yet I think it would be a rash conclusion, to infer from hence, that the same animal could not have a great tendency to get fat; and that when dried of her milk, this tendency

ones: a sort which had been introduced by some, but were soon rejected by all good judges. As to the breed itself, my opinion may be best ascertained, by saying it is the kind I have always kept. I do not here, however, mean to speak against any other breed whatever, as different kinds may suit different situations.

might not soon produce its corresponding effect: for the effect of cause, namely, the tendency of feeding, would remain unopposed in its effects, and be wholly operative. The assumption however here mentioned, ought never to have been made: as well might it have been contended by those who had seen only a bad race of hard-fleshed animals, that there were therefore no other kind, that would produce a much greater quantity of beef from a given quantity of food.

But secondly, to come to the matter of fact, and to speak from experience itself. Some animals have the power of obtaining a greater degree of nourishment from a given quantity of food, than others of an inferior description; and therefore, though some of the former may give a larger quantity of milk than the latter, yet their carcasses also, may at the same time, be better supported. And I have frequently found cows that are great milkers, to keep themselves at the same time in high condition, to feed with the quickest despatch when dried of their milk, and whose descendants will arrive at the earliest maturity; a practical proof, that a great tendency to feeding is not incompatible with a great tendency to milking. Those also who are anxious to witness the same thing, may have it shown to them when they please, as many such animals can be produced.

I suspect the assertion here controverted, originated not so much with those who have done nothing towards the improvement of cattle, as with those who have been content with doing but little. These latter being anxious to sell before they had sufficiently improved their own breeds, asserted, and asserted truly, that where cattle are to be bred for the slaughter, it is of more consequence to have them early feeders than great milkers. Of this I have no doubt; for if only one of these properties could be obtained, I am fully persuaded, that the former would be more advantageous than the latter. But if on the contrary both can be combined, and that they can, I am convinced by experience; we shall not think very highly of those breeds which possess but one of them. For who, that is conversant in these things, does not know the great difference between the value of the produce of two cows, the one a good and the other a bad milker, if we take that produce for one year only? I shall not here mention the great quantity of milk that some of my own cows have given, and the short time that it has afterwards required to feed them. lest it should seem to partake of an air of boasting.

When we consider the skill, the perseverance, and the capital required to improve a breed in the carcass only, it is not surprising that so few have attempted it; and when we consider, that the union of great milking with quickness of feeding, required a two-fold labor; we might almost wonder that it has been undertaken at all. But yet sir, whatever difficulties may lie in the way, every Breeder who aims at superiority, must follow the excellent advice which you have given; and with respect to which, I cannot do better, than quote your own words. "We should, therefore, endeavor to obtain all the properties that are essential to the animals we breed." And this rule was surely practicable in the case before us; by selecting those animals that were the most perfect in point of

form, in quality of flesh, and so on; and again by selecting out of these the very best milkers, using in other respects the same care as I have mentioned in a former part of my letter. Such a procedure in the formation of a breed, clearly adds very considerably to the expense in the first instance; but the advantages afterwards derived are more than a sufficient compensation, as the property of milking is inherited as readily as that of peculiarity of shape.

(TO BE CONTINUED.)

From the American Farmer.

CIDER ROYAL AND BARLEY COFFEE.

Vineyard, near Georgetown, Feb. 8, 1823.

J. S. SMYLER, Esq.

Dear Sir—I observe in your Farmer of yesterday, a receipt to make Cider Oil, as you call it—I have some doubts that the person who furnished you with the receipt, is ignorant of what it exactly is; as well as of the manner of making it—I have seen it made very often by Germans, and it is by them called *cider royal*; and by putting *sassafras*, or any thing else to flavor it, I am certain would injure it; the way I have seen it made is as follows:

To make Cider Royal.

Take a clean well hooped cask, and burn a sulphur match in it, and keep the bung close stopped for about two hours; then put in four gallons of good apple or cider brandy; then take four gallons of the cider immediately from the press, and put it to the brandy, shaking the barrel well to absorb the sulphurous gas. (the cider ought to be strained through a flannel,) and then fill the barrel with the cider before any fermentation has taken place, and bung up the barrel tight immediately, and put it in a cool place, and rack it off in March following. If it is not fine when racked, it may be fined with the whites of eggs—and as soon as quite bright, rack it again into a clean cask and it will keep for years. Some persons do not sulphur the cask, under an idea that it produces head-ache; others put but three gallons of brandy and from ten to twelve pounds of sugar to it. It is, if properly made, and of good cider, a fine vinous beverage, to drink in summer, when diluted with water; and in the German Counties of Pennsylvania, it was the favorite drink, when they got any refreshment at taverns, by all those persons who could not afford to get wine. Those persons that I knew most famous for making good *cider royal*, put rye whiskey to it instead of brandy, as it sooner became assimilated to the cider and vinous than brandy; that is, it was not to be tasted, when brandy could always be discovered by a nice palate. Brandy put to cider or wine after it is well fermented, never loses its flavor in either cider or wine, and instead of becoming vinous, as it ought to be, by fermentation, it is only branded cider, or what used to be called, some 30 or 40 years ago, *Sampson*; which was one gill of brandy or other spirits, put to a tankard of cider, which always produced headaches.

You also, in the last Farmer, make mention of the naked Barley—I remember it for at least fifty years, and it was used by the German farmers of a part of York County, Pennsylvania, and Frederick County, Maryland, to make coffee of; and I recollect of hearing it spoken

of as infinitely superior to Rye, as to its flavor and salubrity—but I do not recollect of seeing it for upwards of thirty years; but formerly I have seen it brought to York Town, Pennsylvania, and Frederick Town, Maryland, for sale by the name of Coffee Barley—The Germans called it "*Coffedgerst*."

To make Barley Coffee.

Roast it in the manner that common coffee is roasted, then take one portion of coffee to about as much as one third of the quantity you commonly use for one meal; then take three times that quantity of the roasted barley whole (not being ground) and boil it by itself, then strain through a tin strainer, with smaller holes than a cullender; put that liquor over the first portion of coffee and make in the usual manner.

I knew a very respectable Clergyman, who was fond of some of the good things of this world; that for several years, I was acquainted in his family, always used his coffee made in the above manner—and he used it, because he thought it an improvement on foreign coffee.

P. S.—I have called on a German's son, now middle aged, who says that he has often assisted his father in making Cider Royal, and he says, that my receipt for making it is correct.—His father was famous for making good *cider royal* of the best quality. He himself, attempted this last year to make one barrel of it, and it turns out to be as hard as the hardest cider.—He spoke to a person who makes good cider, and one whom he could depend on, and gave him an extra price: the cider was made early in the morning, and brought to him before 9 o'clock; he immediately drew off some of the cider, and put to it ten pounds of sugar, and four gallons of apple brandy, and bunged them up tight immediately. He attributes the hardness to a fermentation having taken place before the sugar and brandy was put to it, instead of the sugar and brandy being put into the cask first.

THE FARMER.

BOSTON:—SATURDAY, MARCH 8, 1823.

AGRICULTURAL LECTURES AT DARTMOUTH COLLEGE.

We learn with much pleasure that Professor DANA, of Dartmouth College, proposes to give a course of Lectures, accompanied with experiments on the *general principles of Agriculture*, embracing, particularly, the subject of *Soils and Manures*. The course, we are informed, will be completed in twelve lectures, beginning on the first Wednesday of April, and continued daily. We are told that Professor Dana would be gratified by the attendance of any gentleman or practical farmer, and will give him, gratis, the privilege of such attendance. We hope the Professor will meet with due encouragement in this benevolent project; and that he will successfully employ the lights of science to direct the course of the most useful of the arts.—That he possesses the qualifications which may enable him to apply a knowledge of Chemistry to very important purposes, as respects Agriculture, will, we think, be evident to those who have perused his "Report on a disease afflicting Neat Cattle, in Burton, N. H." published in our paper No. 14, p. 105.

ON MAKING MAPLE SUGAR.

We have repeatedly been requested by our correspondents to furnish some statements relative to the cheapest and best way of making and cleansing maple

gar. We had hoped that Mr. Preston, of Stockport, would, before this time, have obliged us with some marks on this subject, as he informs us [N. E. Farmer, No. 23, p. 132,] that he has "had upwards of forty years experience and observation in manufacturing maple sugar in the same orchard," and "had thoughts of publishing some directions for public benefit." &c. We still wish that the gentleman would let our paper the vehicle of some remarks on this subject. But as the season for manufacturing that article has nearly arrived, we proceed to give such information as it is in our power to communicate; and shall be gratified if it proves useful to some who are engaged in this important kind of domestic manufacture. The following directions were obligingly furnished by Henry Lake, Jr. Esq. of Rockingham, Vermont, who has had much experience in the art to which they refer.

'Scald your buckets for catching sap before tapping the trees.
'The sap should be kept clean from dirt through the process of boiling.
'Avoid leaving your sap long in an iron kettle, as rust will give it a dark color.
'When nearly boiled down to sirup (or thin molasses) a little lime thrown into the kettle will be of use.
'At this stage of boiling as well as in sugaring off, it should be taken to avoid heating the top of the kettle too hot, or any other way burning, as it will injure the color, as well as the flavor of the sugar.
'When the sirup is well boiled down, turn it while into a clean wooden vessel, let it stand two or three days and settle: then turn it carefully from the bottom at the bottom and strain it.
'Hang it over a gentle fire, and when it is warm, in one pint of milk to four or five gallons sirup, which will rise as it begins to boil, and must be taken with a skimmer.
'If you wish to make your sugar very nice, cool it in one half or two thirds will grain, turn it hot into a tight cask; let it stand undisturbed in a cellar, or in a cool place until it is grained at the bottom.—'Then off the molasses and turn the cask bottom upwards over some vessel to catch what will drain out: it stand as long as any will drop, then set your cask right, and what moisture remains will settle to the bottom, leaving the top dry and of a superior quality.
'If you wish to make dry sugar without draining, there are various modes of ascertaining when it is boiled sufficiently; perhaps as sure a method is to drop it on snow and let it cool; if it is brittle as resin it is sufficiently boiled."

ON BOILING MAPLE SAP BY STEAM.

Mr. Preston requests to know "whether there is not a better mode of boiling the sap of the sugar maple than in iron kettles over the fire?" and says, "I am indebted to these inquiries by the circumstance of a young man, lately from an Eastern State, having erected a wooden distillery that is boiled by steam conveyed into the bottom of the cistern by wooden pipes from a small steam boiler, set in an arch some thirty feet distant." We have given in the New England Farmer, No. 5, p. 39, the mode of heating liquids by steam, adopted by Count Rumford, which was by conducting steam to the liquid which it is required to heat. We have in other modes described, by which the steam entered the outside of the vessels which contained the liquid to be heated. These modes may be useful, in many cases, where boiling or heating is the object, without regard to evaporation. When steam is introduced into a liquid, it is condensed, imparts caloric to the liquid, but gives no more heat than what it had previously received from the fire which gave it the force of steam. In condensing, however, or changing from a gaseous to a liquid form, it increases the quantity of the liquid to which it imparts its caloric, and

probably adds as much to the liquid by its condensation, as it causes it to be diminished by evaporation. We are inclined, therefore, to believe, where evaporation is the object, it may be as well to apply the fire directly to the vessel containing the liquor to be evaporated, as to make use of the agency of steam. In this, however, we may be in an error, and if so should be happy to be corrected.

The communication of Mr. Pickering for this day's paper, and that of Mr. Kenrick in our paper No. 30, will, we doubt not, receive the attention which their importance merits. We do not regret the circumstance of those gentlemen differing in opinion upon some topics. By friendly collisions of this kind, the truth is often elicited.

A communication from our good friend in Stockport, Pa. was duly received, and would have been published before this time, had not the Editor wished to accompany its publication with some remarks which he has not yet found leisure to complete. We hope neither that gentleman, nor any other, who may oblige us with their observations, will consider their favors as neglected or ungratefully received, when circumstances may have caused a delay in their publication.

FARMER SUMMARY OF NEWS.

CONGRESS adjourned on Monday last.—An abstract of their last weeks proceedings will be given in our next.

FOREIGN.—A letter from an American officer, now in the Mediterranean says: "I observe a vast deal in the public prints, relative to Greek affairs, and a pretty general indisposition to credit the accounts of their success. But whatever may be said to the contrary by the 'Holy Alliance' and their advocates, I know that the cause is going on gloriously, and if they are not interfered with, there is every rational ground for believing that they will succeed, if not to their immediate and full emancipation, at least to the great betterment of their condition."

An American gentleman, Mr. Gaillard, from Charleston, was butchered in a most shocking manner, not long since in Havana, by pirates, for having observed "that Commodore Porter would soon be among them."

DOMESTIC.—Thursday, the 3d of April, is to be observed as a day of fasting, humiliation and prayer in Massachusetts and Maine.

Fire.—On Thursday night an unfinished brick house in Purchase St. was destroyed by fire. Owing to the spirited exertions of the engine-men and citizens, and plenty of water, the other houses in the block were preserved.

On the 1st inst. a dwelling house in Hartford, Conn. owned and occupied by Mr. Uriah Cadwell, was destroyed by fire, together with nearly all his furniture and provisions.

A house in Thompson, Conn. occupied by a Mr. Lee, was lately burnt, and Mrs. Lee perished in the flames. A medical writer, says the N. J. Eagle, attributes the great increase of Apoplexy to the wearing of cravats, and endeavors to prove his theory by the observation, that women who generally go with their necks uncovered, are rarely subject to this disease.

Four animals of the Lynx species were killed in Craftsbury, Vt. in the month of January. Of one it is remarked, that the whole of its intestines, when extended to their full length, measured but six feet two inches in length.

Appropriate present to John Q. Adams.—A few days since, an enormous Cod Fish, weighing eighty-four pounds, was caught by some Marblehead Fishermen.—On its being landed, it was at once agreed to present it to JOHN QUINCY ADAMS, as an appropriate testimonial of the gratitude of Fishermen for his most able and triumphant defence of the American right to the Fisheries, in the negotiations of Ghent. The fish was accordingly frozen with great care, in order to preserve it, incased in a box of ice, and transmitted, with a letter from the donors, to the Hon. Secretary of State.

Essex Register.

The Anniversary of the 5th of Jan. was celebrated with much spirit at Nashville.—Gen. Jackson was present at the celebration, and from the complexion of the toasts, we should think (says the Boston Gazette) he has a strong disposition to climb the Presidential ladder.

Twelve millions four hundred and seventy eight thousand Cigars were imported the last year into the United States. It is calculated, says the Philadelphia Democratic Press, that the value of all sorts of cigars consumed in the United States in one year, is about five millions of dollars.

A woman in New-York, aged 199 years, while on her death-bed, acknowledged that eighty one years ago, she strangled an infant child.

A New-York paper says, "The effect of the pressure of the Branch upon the local Banks is too serious to be named!"

STRAW CUTTERS:

One of the Farmers best Implements, this season. ON hand and for sale at the AGRICULTURAL ESTABLISHMENT, No. 20, Merchant's Row—Hand and Machine STRAW CUTTERS, some very low prices.

(One) ENGLISH MACHINE, which will be sold for half the cost and charges.

Several HAND MACHINES, suitable for private stables
Boston, March 2

A MORAL LESSON.

Listen, young farmer, to the moral muse,
And catch the useful lessons of her song.
Be frugal and be blest; frugality
Will give thee competence; thy gains are small,
Too small to bear profusion's wasteful hand.
Make temperance thy companion; so shall health
Sit on thy brow, and brace thy vigorous frame
To every useful work. And if to these
Thou happily shalt join one virtue more,
The love of industry, the glowing joy
Felt from each new improvement, then for peace
With modest neatness in her decent garb,
Shall walk around thy dwelling; while the great,
Tired with the vast fatigue of doing nought,
Filled with the ails, which luxury awakes,
Impatient curse the dilatory day,
And look with envy on thy happier state.

Then banish from thy fields the lecherous sloth,
Nor listen to the voice of thoughtless ease.
Him sordidness and penury surround,
Beneath whose lazy hand the farm runs wild;
Whose heart nor feels the joy improvement gives,
Nor leadsen eye the beauties that arise
From labor sees. Accumulated filth
Annoys his crowded steps; even at his door
A yellow mucus from the dunghill stands
In squalid pools; his buildings unrequited,
To ruin rush precipitate; his fields
Disorder governs, and licentious weeds
Spring up unchecked; the nettle and the dock,
Wormwood and thistles, in their season rise,
And deadly nightshade spreads his poison round.
Ah! wretched he! if chance his wandering child,
By hunger prompted, pluck the alluring fruit
Benumbing stupor creeps upon his brain;
Wild grinning laughter soon to this succeeds;
Strange madness then, and death in hideous form.
Mysterious Providence! ah why conceal'd
In such a tempting form, should poisons lurk;
Ah, why so near the paths of innocents
Should spring their bane? But thou alone art wise.

Activity, industry and talents may advance a man to high standing in the community, but prudence and circumspection alone can preserve him in such station. Genius, without prudence, is often a curse to its possessor:

"For many a man, who has much wit,
Needs twice as much to govern it."

Still however, genius is a blessing, and talents are desirable, although their misapplication may ruin a man. No one in his senses would prefer a dull to a sharp tool for fear of cutting his finger; nor should a person of feeble intellect be preferred to another of great mental powers, because the latter by misdirecting his energies may do the most mischief.

No man was ever a knave unless he was also in some degree a fool. Indeed knavery is a compound quality, consisting of folly and low cunning. A man who has a clear head has generally an honest heart; for he must perceive that honesty is not only a duty, enjoined by the laws of God and man, but is likewise the best policy.

It is observed by Hume in his description of the Anglo-Saxons that "Whatever we may imagine concerning the usual truth and sincerity of men who live in a rude and barbarous state, there is much more falsehood among them than among civilized nations."

Notions.—Plants which were once held in dread by mankind, are now used, and found not only innoxious, but of all things serviceable;—whilst those which we now disregard, as at best indifferent, were in times past considered nutritious, pleasant and possessed of countless virtues. We all of us now reprobate the use of quassa by the brewers, and proclaim that nothing but hops is wholesome or pleasant; but we believe that there are brewers now living, who remember when hops were forbidden by law, and the use of them in the brewery held in great disapprobation. Gerard states, that in his day potatoes were eaten sopped in wine; that they were made into delicious conserves and restorative sweet meats; and others he tells us "to give them the greater grace in eating do boil them with prunes, and so eat them." The Queen of James I. considered these such a delicacy, that she had them supplied to her table, but in small quantities, the price being so high as a shilling a pound. But when it was endeavored to introduce this root as a food among the poor, although it was a delicacy of kings, the people declared it a narcotic, a poisonous and mischievous root, flatulent, and causing the leprosy and dysentery.—*European Magazine.*

Glue from Leather.—It is generally thought that the process of tanning renders leather exceedingly insoluble. Means, however, have been found to overcome that insolubility, and to form a glue exceedingly well adapted to the purpose for which it has been used; namely, that of making the *black paper cases*, so much used for a great variety of purposes;—as it not only forms the cement by which they are glued together, but also in consequence of the gallic acid contained in it strikes a black color, by the application of a solution of sulphate of iron (green vitriol, or copperas) to the surfaces of the articles; and lastly serves to varnish the cases.

The process for making this glue is as follows:—Boil the scraps or cuttings of thin tanned leather; such as the upper leathers of boots, shoes, &c. are made of, in stale urine, until they become softened, and will stretch and contract when pulled and let go again, in the manner of India rubber; they are then to be washed in clean water, and boiled in water until dissolved to a proper consistence for use.

Remedy for sore Eyes.—I have lately seen an application for sore eyes rapid in its good effects and so simple and cheap that the poor and ignorant can obtain it. Take small sticks of sassafras, split in fine pieces—put them in a vessel with cold fresh spring water—they impart a glutinous matter to the water—wash sore eyes in this liquid, which cures them without smart or heat.—*American Farmer.*

CHARLES RAWLEY.

One beautiful spring morning, shortly after I came to Green Lane, I took a ride round the neighborhood to return the visits of my new acquaintances, and to say how d'ye do to the many new faces I was in the midst of. After making several calls I arrived at a neat looking Farm-house, whose tenant I had taken a glass of cider with the day before, and who I learned was a young man of promising character.

I was struck as soon as I entered on the place with the business-like appearance of everything. The fences were all in good order, the trees looked thrifty, the winter grain very forward, the cattle in prime keeping; and the place well stocked with poultry, of every kind, fine growing pigs, and a clever flock of sheep. At the barn I observed several persons busily employed, and so stepped down there; when I found Charles Rawley himself, in his shirt sleeves working like a lusty fellow, and his boys round him as busy as himself. He invited me to walk to the house and I did so; and the arrangement of things within corresponded well with that without.

Although it was not much after the ordinary breakfast hour; every thing like cooking or eating had disappeared, there was not so much as a crumb on the floor; the very cat had had her fill, and sat washing her face in the corner. The chairs were all in their places; the table looked newly polished, and the domestic carpet did not bear the print of a single foot-step. By the prettiest sight was the good woman and her two eldest daughters at the spinning-wheels; the little girls did not appear to be, either of them more than 9 or 10; yet they seemed quite mistresses of their business, and worked as smart as their mother. With their flaxen hair neatly combed up, their rosy faces fresh and clean, and their linsey dresses neat and tidy they bespoke a tribute of praise to their excellent mother, which I could not help avail myself even of that early opportunity of paying.

We read the truest lessons of character in small things; and when Charles asked his wife for the decanter of brandy, I sat it down as of good sign; it was an article with which he was not very familiar; and when afterwards I wanted to pay me a small sum of money I saw some choice seed I had promised him, and went to the good woman for the money, I set it down as another. It's always a good sign when husband and wife keep the family purse common, for it shows that they both know how to keep it well—a matter of the first consequence.

I left Charles Rawley's that morning, delighted with my visit, and when I returned home noted in my Port Folio, "Rawley will be rich in a dozen years." It will be twelve years next May since I made this entry and he is no master of a farm of 250 acres of fine land, and has money out at interest, though at that time probably fifteen hundred dollars would have bought him out completely; so certainly do industry, frugality and good management prosper.—*Emporium.*

Pun Legal.—A short time before the removal of the Irish Courts to their present splendid building, one of the walls of the old court house was in a very tottering condition. While a large argument was going on one day in full court this assumed so dangerous an appearance as I checked the proceedings for a short time: during which a young wag at the bar, addressed the court, saying "My Lord, I move for an *injunction to stay the proceedings of that wall.*" "There is no need (replied Curran) a *temporary bar* will be sufficient."

Dr. R. maintained that poverty was a virtue. "That," said Mr. Canning, "is literally making a virtue of necessity."

No. 33.

DISEASES OF CATTLE.

SELECTED AND COMPILED FROM THE BEST AUTHORS,
BY THE EDITOR.

Loss of Joint Oil, or Synovia.

Wounds, or punctures of the joints, often penetrate so deep as to pierce through the tendons and ligaments, occasioning a loss or discharge of the natural secretion of the joint, viz. oil, or synovia; the same accident may happen from any injury exciting inflammation, and inflammation passing on till it produces an abscess into the joint. This disease is always alarming one, and the principle of cure is to reduce the process of healing as quickly as possible, by exciting active inflammation; this to be done after the first effects of the injury are subsided, in consequence of bleeding, purgation and fomentation, in the usual manner, and applying the volatile blister to the joint, composed of Spanish flies, in powder, two dr. spirits of ammonia, four oz.; at the same time the orifice is to be plugged with a tent, and dressed in the following composition:

Sweet spirits of Nitre 3 dr.
Butter of antimony, and extract
of lead, each 2 dr.

The blister and caustic may be occasionally repeated; the mixture every twenty-four hours, till the effusion of joint oil is completely stopped, then the following balsam may be applied once or twice a day, in order to heal up the wound: Tincture of myrrh 2 oz.
Blue vitriol water ½ oz.

The vitriol water may be made by dissolving drachms of blue vitriol, in powder, in a pint of hot water; the balsam to be well shaken before her previous to using it. The blister is to be well rubbed on the joint, till a plentiful discharge takes place from the surface, when it becomes no longer requisite. By this treatment the cure is generally effected, unless when the tendons are materially injured along with the joint, and then any plan of cure will prove ineffectual. When weakness of the joint prevails, after the running of the joint-oil is stopped, which is generally the case, a plaster of gum, &c. as recommended in page 249, should be applied.—*Skinner's Treatise.*

Mange.

This is a cutaneous disease, which is very contagious, for so many cows as come in contact with one laboring under the disorder will soon catch it. Its symptoms are, a scab on the external part of the body, which is attended with an itching. This the animal shews, by having a continual inclination to scratch the affected part or parts against any thing he can get at. Some say that it is caused by a kind of animalculæ, which burrows in the skin. It generally attacks those animals which are in flesh, and have been fed on poor food.

The first step in order to cure this disease is to take a currycomb and gently curry off the scales, in order that the medicine may have the full effect. After this the following applications are to be rubbed on the parts affected, which

may be repeated every three or four days till a cure is effected; and it seldom requires more than two or three applications:

Flowers of sulphur 1 lb.
Spirits of turpentine ½ pt.
Train oil, enough to make it into a thin liquid.

Horn Distemper.

This is a disease which has its seat in the horns. Cows are more subject to it than oxen, and it does not attack bulls; and steers and heifers, under three years old, it is said, are not subject to it. The distemper causes the pith of the horn to be gradually consumed. It is most commonly confined to one horn only, but sometimes appears in both. It is occasioned by poor keeping, by which the blood becomes thin and reduced, and does not circulate properly in the extremities. It is discovered by the sluggishness of the animal, loss of appetite, a coldness of the horn, and a disposition to lie down.

To cure the disease, the horn should be bored with a nail gimblet in such a manner as to effect the discharge of the matter which has become purulent. The hollow part should be well cleansed by vinegar in which a portion of salt has been dissolved, to be injected by a syringe. Dr. Deane recommended the injection of a mixture of rum and honey, with myrrh and aloes. Stimulating medicines, such as ginger, spices, &c. have been given, but these are injurious until the bowels have been evacuated. Laxatives, however, such as sulphur, glauber's salts, &c. prove serviceable; and after the bowels are evacuated, and the horn well cleansed, good keeping will be necessary to effect the cure.

Tail Sickness.

"This is a distemper attended with weakness and sluggishness to which horned cattle are liable in the spring. The end of the tail becomes hollow, and relaxed, but not, as some have asserted, destitute of feeling. A cure is easily effected by the amputation of a small piece of the tail, which will be attended with a discharge of some blood. But when the tail is but little affected, and near to the end, a slit of an inch or an inch and an half, in the end of the tail, is preferable to amputation."

Ulcers.

An ulcer is "a solution of the soft part of an animal body, together with the skin." The symptoms of an ulcer, which is in a way to be healed, are granulations, or little eminences, arising from the surface of a florid or reddish color, small in size, and pointed at the top; the discharge, white and thick. This will generally be effected by giving the animal perfect rest, using mild and simple ointments, such as are composed of oil and bees' wax, or hog's lard, which is not rancid. Turpentine and lard melted together make a good ointment. The following has likewise been recommended:

Goose grease 1 lb.
Hog's lard 2 lb.
Red Lead 3 oz.
Pulverized alum 1 lb.

The goose grease and lard are to be melted over a slow fire; the lead is then to be added in fine powder, which is to be constantly stirred till it becomes cold, in order that it may be well incorporated. A little sulphur and nitre may be given by way of alterative.

If the ulcer assumes an inflamed state, and the surface is covered with a brown transparent matter, the following fomentation will prove useful.

Camomile flowers 1 lb.
Wormwood, a large handful.
Bay and Juniper berries, each 4 oz.
Beer or ale grounds, emptins or yeast 6 qts.
Vinegar 1 qt.

The whole to be boiled for a quarter of an hour. Leeches applied to the edges of the ulcer will be serviceable, and purges of glauber salts or epsom salts.

If the ulcer becomes black and fetid, with a cessation of every inflammatory symptom, and there appears to be danger of mortification, give an ounce of Peruvian bark every four hours; a little opium may be joined with it. Fomentation with hot vinegar will be found useful. When the parts suppurate, cut off the dead matter with a knife, and afterwards dress with some simple ointment.

If there is too rapid a growth of fungous matter, or what is called proud flesh, it may be well to rub in a small quantity of the following caustic over the whole surface of the preternatural growth, with a spatula.

Soft soap 1 oz.
Arsenic ½ oz.
Oil of vitriol ½ oz.
Spirits of lavender 1 dr.

The soap and arsenic to be mixed first, and then the vitriol added by degrees. The whole may then be covered with the digestive ointment of tar and turpentine, prepared as mentioned in No. 29, page 225, 2d col. By these means part of the growth will become dead in a few days, which may be cut or pared off, and the same caustic application made to the remaining part till the whole is destroyed.

In ulcers in fleshy parts there is often a preternatural callous, or hardened growth. This must be destroyed before a cure can be completed. In this case, the before mentioned caustic must be applied, but used with caution. The hard part is to be rubbed with it for half the extent of the swelling, beginning at the orifice. The dead parts are then to be cut away every two or three days, and the application is to be repeated till the cure is complete.

We have now concluded, for the present, our observations on the diseases of Neat Cattle. It is probable we may have omitted to take notice of some disorders to which they may be subjected; and, if so, should be glad to supply the defect; and would be much obliged to any friends or correspondents who may be so good as to point out any errors which we may have committed, either through inadvertency or misinformation. Any remarks which may relate to disorders peculiar to our climate, will be particularly acceptable.

The doses prescribed are intended for cows, which have nearly or altogether acquired their growth. Oxen or bullocks having stronger constitutions than cows, will be more subject to inflammatory diseases, especially when exposed to labor. The remedies heretofore recommended, must therefore be increased in quantity when applied to full grown males. Dr. Skellett says that the bullock must be bled and purged, &c. a third more than the cow, which will be a proper general rule to be observed in all his diseases. This rule, however, must be modified, like every other general rule, according to the circumstances of the case, and the judgment of the practitioner.

Calves are subject to many of the diseases of cows, and in most cases their treatment must be the same, except that the means employed, such as bleeding, purging, &c. should be diminished about one third of what has been directed for the cow; making discretionary allowance for the difference of age, size, and condition of the animals.

ORIGINAL COMMUNICATIONS.

FOR THE NEW ENGLAND FARMER.

MR. EDITOR—I have been a reader of your paper ever since its commencement, and I now begin to think it is high time for me to make a communication to you, which I believe will be beneficial to my agricultural brethren, and if you are of the same opinion, you will please to publish it, or such part of it, as you see cause.

The subject which I propose, is that of the more extensive cultivation of Oats. Various are the kinds of oats. The Barley or Scotch oats, so called, I have cultivated, but not with very great success; their weight is generally about 42 lbs. per bushel.—I have seldom been able to raise more than from 20 to 25 bushels per acre. The black oats I have cultivated; their weight is about 36 lbs. per bushel, and produce about as many bushels per acre as the barley or Scotch oats. The greatest objection I have to the barley or Scotch oats, is, that they must be harvested suddenly after they are fit, in order to prevent waste. The common oats which are raised, I consider preferable. My average crop of late years has been from 10 to 50 bushels per acre, and in one instance 65 bushels per acre.

I make oats principally, and generally speaking, my first crop in the line of a rotation of crops. I break up the piece intended for this crop in the fall, if possible, and in the spring cross plough and harrow thoroughly before I sow my grain; then harrow again until the turf is well pulverized; then sow ten bushels of clover seed chaff per acre, and roll it in. As soon as the grain is harvested, and the young clover has received its growth, I plough it in. This clover with the stubble, is about equal to a common dressing of compost manure. In the fall plough, in the spring I cross plough, after taking from my compost heap thirty loads per acre, which are carefully spread. The lot then being well harrowed and furrowed is ready for planting, either with corn, potatoes, or turnips. This is my second crop. For my third crop I again sow wheat, peas, flax, oats, &c. and stock the lot down with herds grass and red top, which I believe make the best of hay. I let the lot remain in grass three years. Thus you will observe I till three years, and mow or pas-

ture three years. My first and third crop is principally oats.

I have frequently been told that oats and corn were very impoverishing crops; but I find no difficulty in enriching my land as above stated. Ten years ago my average crop of corn was from 30 to 40 bushels per acre. But in passing over a lot the second time which was managed as above in the summer of 1821, I had the satisfaction of harvesting 96 bushels of corn per acre, and received the Society's premium. My other crops have advanced in about the same proportion.

The inquiry will naturally be made, what I do with my oats? Well, sir, after I have reserved for my stock and for seed, I take the remainder to my mill and manufacture them into flour and meal. It will be understood that the oats are kiln dried, then hulled about as clean as rice, then ground, and bolted or sifted, as the case may be. That which I bolt is calculated to be mixed with wheat flour for bread; in which case the oat flour being kiln dried, must be scalded before it is mixed with the wheat flour, otherwise the bread will be too dry. Good oat flour, prepared as above, mixed with wheat flour, half and half, will make as light and pleasant bread as common country wheat flour, and it will trouble good judges of bread to tell it from clear flour bread. Again, it is excellent to make butter-cake, by the Yankees called slapjacks. The oat meal is calculated for puddings, and is a substitute for rye meal to mix with corn meal for bread, or with rye meal for bread. In either case the oat meal must be scalded before it is mixed.

Thus, after supplying my family, the remainder is for market. The oat flour I have generally sold in Boston and New York to the druggists. The meal is also purchased by the druggists. I have generally sold them oat flour for from four to five dollars per hundred, and the meal from three fifty to four fifty, which is, by them, retailed as medicine, from twelve to twenty cents per pound.

The meal is frequently bought by foreigners, by the barrel or hundred, for family use. The sale of oat meal is at present rather limited; the reason is that but very few people in this country, save foreigners, are acquainted with the use of it, except for medicine. Foreigners generally prefer oat meal to flour. I really hope both for our health, and the interest of agriculture, that the time is not far distant, when oat flour and meal will be used in every family for food.

Much may be said as to the value of this article as medicine, as well as for food. It has been a common article for food in Scotland and Ireland for many years. Seldom, if ever, an English, Scotch, or Irish vessel sailed without a supply of oat meal; and I may say it would be well for every commander of an American vessel, in making up his order for ship stores, to include a sufficient quantity of oat meal or flour for his voyage.

As I am one of the homespun family, and wish for information, I hope these few remarks will draw something from more able writers.

I will, when I have leisure, inform the public, through your paper, more particularly, as to the process of hulling oats and preparing the flour and meal, as well as to the construction of the mill and kiln. HENRY STEVENS.

Barnet, Vermont, Feb. 1823

FOR THE NEW ENGLAND FARMER.

MR. EDITOR—Having leisure by reason of a and infirmity to read papers and books, and finding you wish for communications from experienced farmers, I am induced to write. If will I communicate is of any use you are welcome to it, if not, make waste paper of it.

ENGLISH TURNIPS.

About the year 1788, or 1789, reading the English mode of ploughing for wheat fallow the morning early, so as to plough in the dew I concluded to raise turnips in that mode. I ploughed a yard seven or eight times, in which I had raised turnips the year before. The land was very poor, and had borne a worse crop. I sowed it the 24th of July without any manure of any kind, or enriching the soil in any way but by simply ploughing in the dews. The yard was about three rods square. I had a very large crop. I continued ploughing and sowing that piece for seven years without manure, until in the season every year than in the year preceding, till last year, when I sowed on the 20th of August, and had an excellent crop of sweet flavored turnips. I generally plough yearly, from eight to twelve times before sowing. I have raised turnips on a larger scale since, and find them an excellent food for cattle. Yours, &c. WALLIS LITTLE

Townsend, March 4, 1823.

REMARKS BY THE EDITOR.

MR. Little does not inform us what sort of soil raised his turnips on. A heavy loam, or a soil on which clay is found in any considerable quantity, can be ploughed too much. But we have some doubts whether a sandy soil is benefited by very frequent ploughing. A practical as well as scientific farmer told the Editor that he had attempted to improve worn out field, with a sandy soil, by frequent ploughings when the dew was on, but did not succeed. Scorching rays of the sun appeared to rob the soil of fertilizing particles, and as he expressed it, the land he ploughed his kind the poorer it grew. The story of Tull, an old English writer of celebrity, who thought that frequent ploughing might, in all cases, serve as a substitute for manure, has been found not to answer. Sir John Sinclair has the following observations on the subject:

"The management of sandy land, according to a system adopted by the celebrated Duckett, has been strongly recommended by an eminent author, as founded on three principles: 1. Ploughing very deep to a due degree of moisture was thus preserved in light land, by means of which his crops were flourishing in seasons of drought, which destroyed those of his neighbors: 2. Ploughing seldom, but effectually, with a trench plough, or what he called a skim-conter plough, with which he buried the weeds that grew on the face; he has been known to put in seven crops only four ploughings: and 3. Occasionally raising a crop of turnips the same season after a crop of wheat or of pulse."

It should seem to be the modern practice of husbandmen in Great Britain, when they cultivate sandy soil to give one deep ploughing in 12 or 13 months, followed by shallow tillage afterwards, with what are called flippers, scufflers, &c. instruments which stir the soil to a small depth only.† We know that our cultivators are not apt to make too much use of the plough, and we submit it to consideration whether some kind of soil composed of his turnip yard, which he enriches without manure, by ploughing only.

FOR THE NEW ENGLAND FARMER.

MR. EDITOR—I have known many farmers lose cattle, sheep and hogs, by their loss

looked with roots and apples, and other similar articles, and have lost them myself, till I found the remedy below.

When an animal is choked, take a quart of water, a little more than milk warm, and put in a good large spoonful of soft soap, and stir well, and turn it down the creature's throat, out one third at a time. I never knew it fail in making them throw it up. It causes the throat to be slippery, and the root is then easily dislodged.

W. LITTLE.

TO THE EDITOR OF THE NEW ENGLAND FARMER.

Agriculture is as much interested on the improvement of Machinery as the breed of Cattle. Particularly mills, and other labor saving water powers.

I have been, through life, acquainted with mills; made many observations and experiments, being frequently employed to project and draught them for practical millwrights. Yet with a very essential part of correct millwrighting, with all my study and observations, I am yet ignorant, or in other words, incompetent to calculate; that is, to calculate correctly the number of cubic feet of water that will run in a mill race of any given time, dimensions, and descent per rod.

Or, suppose I had a mill race dug with geometrical exactness, twenty rods long, with a fall or descent of one inch in each rod, two feet wide in the bottom and six feet on the top, and three feet deep at the upper end—how many cubic feet of water would such a race discharge in a minute, or any given time?

Or in other words, suppose that on such a race I had three water wheels, one requiring one cubic foot of water in a given time, the others six and four feet in the same time—how deep must the water be turned into that race to supply the one, two or three wheels?

These are questions that in the prime of life I never could find correct rules to answer; and from many experiments on a long large mill race I fully proved that the deeper the water in the race the swifter it ran—that it ran swifter on the top than on the bottom—that it ran swifter in the middle than near the sides; that imputed to friction.

We know that the whole power of water is in its specific gravity. That the particles of water are globular, and its velocity is occasioned by sliding down an inclined plane, similar to what musket balls would do: that a cubic foot of water weighs 62½ lbs. Therefore by the rules of algebra there appears more given equations than unknown quantities, and by that rule we are limited for an answer. Yet from near fifty years study, I have been unable to discover a correct rule for such calculations.

I now use the freedom to appeal to the learned and ingenious gentlemen who have been engaged in canals in the Eastern States, to publish such a desired theorem in thy useful paper. And in return, life and health permitting, I may perhaps publish a theorem of equal value. It is well known to most people that there is a certain circular motion in which a bucket of water may be swung bottom upwards, and none drop out; that is, a certain motion in nature wherein the centrifugal force balances gravitation. It is the same motion in the laws of gravitation that retains the planets in their orbits—a law so absolute that every particle of

matter on our globe is obedient to it; and that is the true motion for every wheel in a mill, and the stone also to run so that the centrifugal force may balance the friction on the gudgeons, and prevent what millwrights call back-lacing.

My theorem, which is in algebraic expressions, may perhaps be made intelligible in arithmetic, and I will publish it in return for the one that I have requested.

SAMUEL PRESTON.

Stockport, Pa. Feb. 1823.

REMARKS BY THE EDITOR.

Our correspondent has, in the above, given us some ideas relative to one of the most difficult and perplexing branches of mathematical and mechanical philosophy. The theory of the motion of rivers and canals, the doctrines of hydraulics, hydrostatics, and the application of water power to turn the machinery of mills, is but little understood, in comparison to the advances which have been made in other sciences of less importance. "We have," says Professor Robinson, "merely skimmed over a few common notions concerning the motions of water; and mathematicians of the first order seem to have contented themselves with such views as allowed them to entertain themselves with elegant applications of calculus." This, however, has not been their fault. They rarely had an opportunity of doing more for want of a knowledge of facts. They have made excellent use of the few which has been given them; but it required much labor, great variety of opportunity, and great expense, to learn the multiplicity of things which are combined even in the simplest cases of water in motion. Although the first geniuses in Europe have, for this century past, turned much of their attention to this subject, we are almost ignorant of the general laws which may be observed in motions of fluids. Who can pretend to say what is the velocity of a river of which you tell him the breadth, the depth, and the declivity? Who can say what swell will be produced in different parts of its course, if a dam or weir of given dimensions be made in it, or a bridge thrown across it? or how much its waters will be raised by turning another stream into it, or sunk, by taking off a branch to drive a mill? This eminent writer confesses that he knows of no train of reasoning, by which he can connect the general laws of hydrostatics with the phenomena of the uniform motion of the water of a river or open stream, which can derive its motion only from the slope of its surface, and the modifications of this motion, or its velocity only from the width and depth of the stream. There are circumstances, he observes, in substance, which distinguish a portion of a river from a vessel of the same size and shape, in which the water is at rest. In both, gravity is the sole cause of pressure; but there must be some circumstance, peculiar to running waters, which modifies the exertion of the active principle, and which, when discovered, must be the basis of hydraulics.

The velocities of water issuing from orifices at various depths below the surface, are in the square roots of those depths; but this rule, owing to causes not fully explained, will not apply to running streams. The motion in rivers or channels is obstructed by inequalities, which give to the contiguous filaments of the stream transverse motions, which thwart and impede the regular progress of the rest of the stream. These obstructions are most effectual in the beginning of the course of the stream, because the stream being small, has more outside, or a larger proportion of the particles of water, in reference to the whole mass, is exposed to friction against the sides, or banks, of the stream and its bottom. The particles of a liquid move with less friction among themselves, than when in contact with a solid body, although the surface of the latter be as smooth as art can make it.

From the above premises, we believe it would follow that by doubling the quantity of running water in any given trough, pipe or channel, which shall be discharged at the lower extremity adjuvante, or out let, in any given time, we more than double the power of such water to drive any kind of machinery. If running wa-

* See Encyclopedia Britannica, Art. River.

ter, which would cover the bottom of a trunk or flood of any given dimensions, inclined in a given angle, one foot deep, would drive to advantage one pair of millstones of four feet in diameter, by letting in water sufficient to cover the same flood two feet deep, at least three pairs of similar millstones might be driven. What millwrights call the head and fall would be increased one foot, or nearly doubled, if the plane on which the water ran was not much inclined, and the friction against the bottom would be but very little, perhaps not any greater. But as we said before, this is a very abstruse subject, and requires more time and thought than we can at present bestow upon it.

We have seen an excellent treatise on the subject of Water Mills, by Mr. Smeaton, an Englishman, a celebrated Engineer, and the person who superintended the building of the Eddystone Light House. We have deferred our notice of Mr. Preston's communication some time, with a hope of finding that work, which we believe would solve some of his doubts; but have not yet been able to put our hands upon it. We shall make some farther search, and if we should not succeed in obtaining it, shall endeavor to state, from recollection of long standing, some of the maxims it contains; particularly those which relate to the power of small streams to turn machinery; the mode by which such power is best obtained; and the relative velocity to be attended to between the water-wheel which gives motion to mill-stones, and the mill-stones, in order to obtain the greatest power from the stream.

From the Republican Advocate.

Great Crops in Hartford County last season—with their mode of culture.

BARLEY.—Joseph Watson, Jr. raised in Hartford Meadow on one acre of land sixty-three and a half bushels of barley. The land was seldom overflowed. In 1820 it was well manured, planted with corn, and in the fall eighty bushels of corn were taken from the acre. In 1821 it was manured with about fifty loads of manure and four bushels of plaster and some ashes, and again planted with corn. 1st April, 1822, it was ploughed and soon after dragged, and on the 12th of April, it was again ploughed, and sowed on the 15th to barley, four bushels to the acre, well harrowed and stocked with herds grass and clover. The barley was mowed the 25th of July and threshed the first of January.

POTATOES.—The above named gentleman also raised on one acre of meadow land, 303 bushels and 3 quarters. The land was set to Tobacco in 1821, it was ploughed eight inches deep, and on the 26th May, it was furrowed out and planted in continued rows, three feet and eight inches apart, and manured in the rows with thirty loads barn yard manure, ten loads from the hog sty, and three bushels of plaster; thirty bushels of potatoes were planted on the acre and hoed twice with the horse hoe, and dug them the latter part of October.

FLAX.—Mr. George S. Spencer raised from one half acre of land, 199 pounds of well dressed Flax, and six bushels and twenty two quarts clean seed. In the fall of 1821, the land was sowed with wheat, having been previously manured with fifteen loads of yard manure. The winter killed a good part of the wheat. In the spring of 1822, the land was ploughed—it being very mellow, the soil a sandy loam—then dressed with a harrow, and sowed one bushel of the Long Island seed, then harrowed it in, pulled the flax in July, and dressed the same in January and February, 1823.

A letter received from a black man in Hayti, who emigrated there from Rhode Island some time since, speaks in high terms of the prospects in that island for settlers.

REMARKS

ON THE IMPROVEMENT OF CATTLE, &c.

In a letter to Sir John Savours Sebright, Bart. M. P.
by Mr. John Wilkinson, of London, near Nottingham.

Let each succeeding race employ your care,
Distinguish which to slaughter, which to spare;
Mark well the lineage,—let the purest make,
From purest blood, its just proportions take.

(Continued from page 254.)

With respect to the value of different breeds as milkers only, some persons have attended solely to the quantity of milk given by each cow, while others have had regard only to the quality. But it is certain that this value must depend on the quantity and quality jointly, yielded from a given quantity of food.* By a given quantity of food is to be understood, not merely the same weight, but the same weight of the same kind and quality also; and in any experiment, it ought moreover to be given under similar circumstances. The time too allowed for an experiment of this nature ought to be at least a whole year; because some breeds will give a great quantity of milk just after calving, but will not yield that quantity for any considerable time; while others will not give so great a quantity at first, but will approximate to it much longer. As to the number of the cows, it need by no means be the same in two or more cases of trial; but the proper number for the consumption of the proposed quantity of food. For the question is not, whether the produce of so many of one breed, be more valuable than the produce of the same number of any other; but what will be the value of the produce afforded by a certain quantity of food, when bestowed on the one, compared with the value of the produce afforded by the same quantity of the same kind of food, when bestowed on any other; remaining circumstances being as similar as possible.

In comparing the value of any one breed with the value of any other, in reference to the shambles, it is very evident, that the placing out certain quantities of different kinds to feed, and comparing the increase of weight in each case with the quantity of food consumed, will never determine the question. Because, here the question is not which have paid the best for a certain period, but which have paid the best during the whole course of their lives; the different breeds being killed at that particular age which will give to them respectively the maximum of profit. That there is a certain age which is the most profitable for disposing of one kind; but another age, and far different, the most profitable for another, is a circumstance well known to every practical farmer.—Some breeds cannot easily be made fat till they are three or four years old; while others are capable of being so at any age we may think

proper. I believe the most profitable age for disposing of fat cattle of the improved short horned breed, is from two to three years old, according to circumstances at the time of sale.—In all experiments of this nature, there are many and great difficulties to encounter in order to render the comparisons just; we may, however, proceed with a sufficient degree of accuracy to determine what breeds are unquestionably the best; and the greater excellence has always been yielded to those which arrive at the earliest maturity.

I now come to the descent or lineage of animals; and so vast is the importance of this part of my subject, that I thought I could not do better than notice it in the title page itself. And for the same reason also, I may be allowed to quote your own words, which are so apposite to my present purpose, and so perspicuous in the delineation of the truth you wish to inculcate; a truth which can never be too fully impressed on the minds of those who are engaged in the improvement of stock. They are as follows: "Regard should not only be paid to the qualities apparent in animals selected for breeding, but to those which have prevailed in the race from which they are descended, as they will always show themselves, sooner or later, in the progeny: It is for this reason that we should not breed from an animal, however excellent, unless we can ascertain it to be what is called *well bred*; that is, descended from a race of ancestors, who have, through several generations, possessed, in a high degree, the properties which it is our object to obtain." This observation of yours, sir, appears to me so comprehensive, so clear, and yet at the same time so concise, that I dare not attempt either to add or take from it; I will only endeavor to illustrate it by some familiar example, and as many are more conversant with the color of animals than the excellence of their shapes, it may not be amiss to refer to the former. Suppose, then a number of pure Devon cows to be crossed with a breed of perfectly white bulls; in this case it is probable some of the calves would be perfectly red, others white, and the greater part would partake of these colors jointly. If we were now to take the red heifers produced by this cross, and put them to a Devon bull, it would not be a matter of any great surprise, if some of their progeny, though sprung from red parents, should be perfectly white, and still less, that several should be mixed with this color; though it would not by any means be so probable as in the former instance. And were we thus to proceed through several generations, this white color would be less and less apparent in the breed, but would most probably occasionally shew itself in some individual or other. If on the other hand, we were to breed from pure Devons only, that is from those that have been carefully bred for a great length of time, we should reasonably expect their offspring to be of the same color with the parents themselves; while any deviation from this, would be looked upon as one of those changes, which nature sometimes produces out of the common course of things. And what has here been asserted of color, is equally applicable to peculiarity of form, or quality of flesh.

When a breed is once brought to that degree of perfection it is capable of, the same care

must be used in the continuance, as was shown in the formation itself; or as you have just observed, "what has been produced by any means must be continued by the same means." For though animals that are themselves good, and have also been descended from a long race of valuable progenitors, are by no means likely to produce, even in a single instance, a bad offspring; yet I think it will no more be contended, that every animal produced by the same parents, is precisely of the same value, than that the red color in the Devon cattle is precisely the same shade in each individual, or that the horns of the Lancashire are exactly of the same length. It has already been observed indeed, that there is a *strong* tendency for like to produce like, that there is a *slight* tendency to change, and that nature, moreover, sometimes deviates from her common course. If, however, such a deviation takes place, it may be continued; as experience teaches both in the animal and vegetable kingdom. And hence will very clearly follow, the impropriety of keeping a bad animal, on pretence that it is well descended; an error which some Breeders have fallen into, if not in judgment, at least in practice. Hence also it will appear, that this defective kind of animal of which I have been just speaking, is generally produced from some mixture of impure blood, or that the breed has been declining through several generations; in either of which cases it can never be said to be well descended. For, in order that an animal may be well bred, it is not sufficient that we are able to trace it to parents, the most perfect of their kind; but every intermediate gradation ought also to be good. It will appear too, from what has been advanced on the formation, the descent, and continuance of improved stock, that no animal can be depended upon for breeding, but what is in itself good, and is moreover *well bred* in the strictest sense of the words.

It may not be improper to observe, both with respect to the improvement and the decline of breeds, that they are in general gradual, and proceed but slowly through several generations. And hence, it is not at all inconsistent to say that "animals have at length been produced very unlike their original stock;" and yet, at the same time, there is a strong tendency for "like to produce like." But this remark respecting the slowness of change, refers to distinct breeds, and also where any particular family is not crossed with others that are much better or much worse of the same kind; nor does it include adventitious circumstances, as pasturage, climate &c. And it is on account of this slowness of procedure, that so many, who have originally engaged in the improvement of stock have been obliged to expend a considerable sum of money before they could obtain any material advantage; while those who have purchased of that stock, when improved, have reaped an immediate, and even a large profit.

With respect to crossing distinct breeds; it may be proper to divide the subject into one or two separate heads. And first, as to what may reasonably be expected from such a union.—Here you remark, sir, that "you do not, by any means, approve of mixing two distinct breeds, with the view of uniting the valuable properties of both." And from what follows, I conclude the import of the words to be, with the view of uniting these properties in the full

* This I think is so obvious, that I need not attempt to explain the fact itself; but only mention after what manner experiments ought to be made. Hence too it very clearly follows, that the determining of what quantity of cream is produced from a given quantity of milk, will never ascertain the relative value of different breeds as milkers. This rule indeed is defective on its own principles, as it will by no means ascertain even the quality; for the cream of some cows is far richer than that of others, and will yield a much greater proportion of butter.

fection, in which they existed separately in ch. We have occasionally been amused with ch pretensions, yet he who is a careful observer of facts, will scarcely, I think, be inclined to credit them. I have seen much of the ture of crossing, for reasons that I shall afterwards mention, but never yet saw the accomplishment of an object so desirable, as the full attainment of the good properties in each, without any mixture of the bad. Indeed it must be vicious to every man of sense, that there is no reason to expect a perfect union of the former, rather than of the latter. The one are just as likely to be inherited as the other, and for the very same reason. The thing generally to be expected from mixing the breeds of animals, possessing properties differing in degree, in such union of those properties in the progeny, as they may be greater than in the ancestry on the one side, but less than in that of the other; though it is also true, as you have observed, and as I have before hinted, that the offspring will sometimes nearly resemble one parent only. In crossing the cart mare with a good horse, no man expects to obtain from the produce, the strength of the former, with the speed of the latter; but an animal, that is swifter than the cart horse, yet incapable of drawing great a burthen. It does not follow, however, that no cross can be useful; it may be very useful so. For instance, there are many situations, which will readily suggest themselves to the mind, where an animal with less speed, or less strength, than such a one as might reasonably be expected from the cross in the foregoing example, would by no means be so useful; and yet, where more of either speed or strength, would be almost, if not altogether unnecessary. Again, it occasionally happens, that the breed of cattle which is possessed of the greatest excellence, may be too large for the sturage of a particular situation; and yet a cross from these might obtain a very considerable advantage. Or a breed, which is unprofitable on the whole, is sometimes kept for the sake of a particular quality, which it possesses to so high a degree, that it would scarcely be the worse, if this quality were somewhat diminished. And this I think is the case with the derney cow; a breed which is kept by some of the nobility and gentry, entirely on account of the richness of the cream; but yet, the quantity of milk afforded by them is so small, as to make them extremely unprofitable, even as milkers. I have frequently known this breed to be crossed however by a well-bred short horned bull; the produce are generally much better milkers than the Alderneys; are more beautiful in their appearance, as not being so heavily boned; and frequently come to a very considerable weight. It will be inferred from what has been already said, and it is an inference which I have seen supported by numerous examples; that where one breed is inferior to another in each individual point, the worse will generally be improved by the better, not partially, but altogether. But where distinct breeds possess their several advantages in different ways, to expect a full and complete union of the good qualities of each, without any mixture of the bad, is to expect a result, contrary to the whole analogy of nature.

I shall inquire secondly, whether a cross from two distinct breeds can be obtained and continu-

ed, so as to unite in almost an equal proportion, the properties of both; and I am fully of opinion that this can be accomplished. The former part of the question has, I think, been already answered; and I have seen the latter effected between the long and short horned cattle. In this neighborhood there were many dairies of long horned cows, descended from the stock of the late Mr. Bakewell; and it was not at all surprising, that the possessors of such stock should be much prejudiced in their favor, on account of the eminence of so great a breeder. When however the improved short horned cattle began to make such rapid strides as they did about thirty years ago; many were willing to try a cross from them, but were not willing to proceed further for the present. This cross being extremely approved of, they rejected such as inclined too much after the one or the other; and continuing to breed from those that partook of the mean, a breed, usually called half horned ones, was at length established; as well known by their particular characteristics, as either of the former.

There is another mode of crossing, which has frequently been attended with the greatest advantage for the improvement of inferior breeds; which is, by crossing the females of the worse with the males of the better, and their produce again in the same manner, through several succeeding generations. By this method, the blood of the former will be more and more exhausted, and a breed at length obtained nearly resembling the latter;* according to the example you have given of Merino—Ryeland Sheep. Since however, the blood of the former, though less and less in each succeeding generation, can never entirely be taken away; it will follow that the value of the produce at any particular time, must depend partly on the value of the females from whence the cross originally descended. I mentioned under the last head, a cross introduced by many in this neighborhood, between the Long and Short Horned Cattle, partaking in nearly an equal proportion of the properties of both. But afterwards, when the improved Short Horns had gained so complete an ascendancy over the Long, and prejudice in favor of the latter, was borne down by experience; this cross, as well as the remaining Long Horned Cows, were put to bulls of the former description, and their produce again, through many generations; the result of which agrees with my present position; namely, that the future crosses, at length, so nearly resembled the Short Horned Cattle, as scarcely to be distinguished from them. The same thing has been effected by crossing Scot's in like manner; and I doubt not, might be from any breeds whatever.

It may be observed generally, and lastly, that no arguments against the system of crossing can be drawn from the nature of the case; because it is highly probable that the various breeds of

* It has before been remarked on the subject of crossing, that though the produce may be expected generally to partake of nearly an equal proportion of the properties of both; yet it not unfrequently happens, that some individuals take very much after one parent, and some to the other. And hence it will follow, that the approximation above mentioned, may be accelerated or retarded by a judicious or improper election in each succeeding cross.

† That crosses are unnatural, seems to be a phrase used by some, without understanding its meaning; and taken up by others without consideration.

Cattle, descended originally from the common stock; and it is absolutely certain, that the original breeds if more than one, could not have been numerous. This, therefore, must necessarily exclude all objections, drawn prior to experience; and experience itself has frequently proved it to be highly beneficial. I have already mentioned a valuable cross, where richness of cream is preferred, between the Alderney Cow and improved Short Horned Bull. I have seen moreover, both Devons, Herefords, Lancashire, and Scots, all crossed with these Bulls, and all producing very valuable Stock. In Lincolnshire also, they are beginning to use them very much. Since indeed the improved Short Horned Cattle have been in such great request, as they have of late, there is scarcely any breed in the kingdom, where individuals have not been crossed with them; or any county into which some of them have not been sent.

But it is proper to remark, that the object of every cross, as well as of every distinct breed, ought to be the attainment of an animal, adapted to that particular situation, for which it is designed: for what may be most advantageous in one situation may be unprofitable in another. And unless this observation be attended to, we can never reasonably look forward to success. For instance, though I consider the improved Short Horned Cattle as by far the best for the country at large, yet there are situations where I should by no means recommend them. I do not think that the mountains of Scotland could be better stocked, than with that hardy, nimble little race, which at present possesses them; while some of their more fertile situations, might very well bear a cross from the breed just mentioned; and some the breed itself. On the other hand, scarcely any greater blessing could befall Ireland, than the introduction of the breed to a considerable extent. For land which is capable of bringing to any tolerable state of condition, a race of such hard, bad fleshed ones, as are generally found to infest that country, would be capable of bringing a better kind to the greatest state of perfection.

Nothing can be more contradictory than what has frequently been advanced by various persons on the whole system of crossing; the understatement of some, seems only to have called forth the overstatement of others; and interest or prejudice have rarely been forgotten. It would have been well, Sir, had some of these gentlemen attended to you on the subject; they would have been directed to an example where the result was likely to be beneficial, and their own reflections might have suggested many more. They would have seen also the idea of the union of the good properties, existing separately in distinct breeds, without any mixture of the bad, discarded on the ground both of reason and experience. In a word, they might have perceived, what they ought reasonably to expect, and what they ought not.

The reason I have been thus diffuse in the present part of the inquiry, is, that prejudice may not prevent a partial improvement, where a full and perfect one cannot be immediately effected; and to save others an expense, which some have unnecessarily incurred. Several gentlemen who have been convinced of the great advantage of improved Short Horned Cattle, have no sooner been in possession of a bull

and one or two heifers, than they have wished for more. On account of the demand however, it has frequently happened, that they have not been able to be supplied with a great number for the present. To remedy this, they have bought up some of the best Short Horned Cows they could meet with in the market, many of which, as might have been expected, have not answered the end proposed. My advice, therefore, to such gentlemen, is rather to cross the Cows they already possess with the improved Short Horned Bull; and gradually to get rid of them and their progeny, as the stock from their thorough-bred heifers continues to increase. By this means a pure breed would shortly be obtained; and, in the meantime, the rest, greatly improved. It would afford, moreover, an opportunity of comparing the improved Short Horned Cattle with the stock that had previously been kept; and conviction arising from experience, is always to be preferred to bare assertion.

It can scarcely be expected, that I should enter particularly into the praises of the improved breed of Short Horned Cattle, as it would have too much the appearance of extolling a race of animals because in one's own possession. I thought it would be better to confine myself to general rules, and to shew by what means the best of each kind may invariably be discovered. I have endeavoured moreover, to make the whole statement plain and simple; to divest it of every appendage which might serve either to disguise or conceal the truth; and to use that order which seemed best calculated to assist both the judgment and the memory. To this end therefore, I have treated, first of all, on the formation and improvement of distinct breeds; then, on the perfection of their shape, and the quality of their flesh; afterwards, on the comparative value of all, considered both as milkers and feeders; and, lastly, on the means to be used for the continuation of the most important properties, when such properties have been once established. But in doing this I have adverted to several other particulars, which appear to me to arise immediately from the subject, and to be in themselves of the greatest consequence. How far I have succeeded, Sir, in this part of my design, must be left to your superior judgment; and I can only say, should it meet your approbation, it will certainly afford me the greatest pleasure.

There is one observation I will make, which to many, may be of considerable use. In the course of my experience, when applied to for Cattle, I have several times been requested to send the smallest in my possession; when in point of fact, the situation for which they were wanted, was capable of feeding the largest Ox that ever grazed, supposing the animal to be of a superior quality of flesh, and in other respects good. And such requests I have generally found to be owing to the badness of the Cattle in those particular districts, rather than to the inferior quality of the land itself. In such cases, therefore, it is clearly of importance, that the animal should be of a good size, as well as of a good quality; because when such Cattle are found to do well, that alone will serve to remove the unfounded opinion respecting the soil. But you, Sir, who have excelled in such a superior degree with your Sheep and also in other respects, well known how much de-

pends on the animal;* and that the soil is frequently blamed when the fault lies wholly in the stock. This I have seen proved again and again.

Nothing can be more just, than your observation, "that the attention which gentlemen of landed property have of late years paid to the improvement of breeds of domestic animals, has been extremely beneficial to the country." Had not such improvements indeed taken place during the last fifty years, it would not have been possible to supply the market with that quantity of animal food which the present population demands. Although in several districts these improvements are chiefly owing to the professional breeder; yet it is nevertheless certain, that there are many other situations, where they must first be introduced by the man of fortune. For the common farmer, either from a want of money, or the fear of a miscarriage, will rarely be induced to try an experiment, before he has had it in his power to witness the result. In such places therefore, where the improvements in stock, are at present, either few or none; I think it would not be found a bad plan for those gentlemen who supply themselves with valuable animals, to allow their tenantry to improve from their own stock at a certain reasonable rate. By this means they would soon repay themselves the small expense they had been at; would possess a valuable breed, instead of an inferior one; and by increasing the property of their dependants, would afford to themselves an additional security for their rent. Nor would this be at all injurious to the breeder; for the more valuable stock is known, the more it is sought after. And its great importance can never be better ascertained, than by a reference to the late distressed state of Agriculture. The extent of bankruptcy in those districts where such stock was to be found, was never any thing like equal to the extent, where it was not; other circumstances being the same in both cases. Whatever may be the real degree of success of each nobleman or gentleman in these undertakings; I think all may look forward to a fair remuneration; besides the satisfaction of conferring so great an advantage to their own immediate neighborhood, and being justly entitled to the thanks of the country at large.

I remain, Sir, your most obedient,

And very humble servant,

JOHN WILKINSON.

Lenton, near Nottingham, 1818.

* I suppose, indeed, had some of the finest animals, selected from your flock, been described to those who had never seen them, they would scarcely have given credit to the fact; while those who had been eye-witnesses, if unacquainted with what judgment and perseverance could effect, might have considered the production of such beautiful creatures, rather as accidental, than as arising from extraordinary skill in the art of breeding.

[Appendix in our next.]

Symmes' Theory.—We find from Newspapers, that professor Steinhausen, of Germany, is the author of a similar hypothesis, viz: that our earth is a hollow sphere, not more than two miles thick, on the outer surface of which we live. "If it be so," says the Philadelphia Union, "instead of searching for an entrance at the north pole, we had better begin to dig downwards at once, and see what kind of neighbors we have."

THE FARMER.

BOSTON:—SATURDAY, MARCH 15, 1823.

We have received repeated requests from a number of correspondents to publish particular articles, which will not pass unregarded, but meet our compliance soon as leisure and room can be afforded. We are right glad to perceive an increased and still increasing attention to subjects deemed proper for insertion in our paper; and shall comply with the solicitations of our friends with all convenient expedition. In the meantime our readers may, if they please, apply to us the following couplet from the poet Churchill:

"He hobbled on, his will was good,

Could he go faster than he could?"

and instead of being offended with their freedom, we will thank them for their candor. The intelligence from Europe having set our news-mongers on the tiptoe of expectation, we have concluded to give them something just to slake their curiosity till they can have time and opportunity to mend their draughts from fresher and fuller fountains.

FARMER SUMMARY OF NEWS.

Important News from Europe!

London papers have been received to the 29th of January, and convey news of much interest. A Manifesto of the Congress of Verona to European Courts has been issued, by which it is considered that the cause is cast, and Spain "must fight"—or submit. The Spanish government appears to be undismayed; and in answer to the despatches of the Allied powers declares in the most decided tone, that it neither recedes, in any manner, the right of intervention, nor admits the necessity of any foreign cabinet to meddle with its affairs; and that the remedy of all the evils which may afflict the Spanish nation, only concerns itself. M. Galiano, one of the members of the Cortes, moved that the Committee on Foreign Affairs be instructed to present, within forty-eight hours, the project of an Address under all customary formalities, to be printed in all the living languages, and profusely distributed throughout Europe, in order that the whole world may know that Spain, though she desires peace, does not refuse war; that she is ready to renew sacrifices she has made, and that she will never digress one step from her constitutional system. All the public bodies in Madrid have presented addresses to the Cortes, tendering their "lives and fortunes," and breathing revolutionary language.

It would seem by the Manifesto of the Congress of Verona, that the attempts of the Greeks to gain the freedom have not met with the approbation of the potentates. Every approximation to freedom seems to call for the exertion of their energies. The Manifesto contains the following observation—"At the moment when the military insurrection in Naples and Turin yielded at the approach of a regular force, a fire-brand of rebellion was thrown into the Ottoman Empire."

A Paris article of January 12th, says there has been a secret sitting of the Cortes to treat of the question of English indemnities for the seizures of English vessels in the West Indies, of which so much has been said of late. The Cortes are willing to admit the claim and an amicable adjustment will soon take place.

By an article published at Madrid Jan. 9, it appears that the Spanish government has issued two decrees by the first all the ports of the Spanish Colonies in South America will henceforth be open to all nations; by the second, the demands of the English merchant respecting the losses they have sustained by the piracies in the South Seas have been inscribed upon the great book of the public debt.

There is every appearance of vigor and animation in the councils of Spain, and public spirit is raised to the highest pitch of excitement. But it is to be apprehended that internal divisions are at least as much to be dreaded as external invasion. Gen. Quesada, one of the oldest of the Spanish generals, has declared that a Bourbon would redeem the evils to which Bonaparte subjected us, and it is under triumphal arches that a French royalist army would march on its way.

Madrid. The whole population would spontaneously join the French, and the news of its approach would act with electric effect in all our provinces. We do not refuse the aid of the English and Portuguese against Bonaparte; how then can we reject the aid of the French, our natural allies, to annihilate the revolution?"

The Austrian, Russian and Prussian ministers left Madrid on the 13th January, and orders have been sent to the French Minister to leave that capital.

An Austrian army of 40,000 men is ordered to assemble in the Italian Provinces; and a Prussian army of equal number, on the upper Rhine, to march through France whenever his Majesty shall require it. Russia has an army in Poland of 100,000 strong.

Earthquake in South America.—On the 13th Nov. a terrible earthquake took place at Valparaiso which two or three minutes laid almost the whole city in ruins, so that not a dozen dwellings remained habitable with safety and comfort. Three hundred persons perished by the falling of buildings, many are missing, and any more wounded. The Governor's palace was destroyed, and the Supreme Director had nearly lost his life in attempting to escape from it. Several towns and villages in the neighborhood were greatly injured.

Later Still.—Since the above was in type we have learned that London papers have been received in New York as late as the 30th of January. They have a very arid aspect, and there appears to be no other hope of war's being evaded but the powerful interference of Great Britain. A speech of Louis XVIII. at the opening of the session of 1823, contains the following paragraphs:—

"I have ordered the recall of my Minister. A hundred thousand Frenchmen, commanded by a Prince of my family, by him whom my heart recognizes as a son, are ready to march, invoking the God of Saint Louis to preserve the throne of Spain to a descendant of Henry IV.; to preserve that beautiful kingdom from ruin, and to reconcile her to Europe."

"If war be inevitable, I shall omit no effort to narrow its circle, and to limit its duration. It shall be undertaken for no other purpose but to conquer that peace which the state of Spain would render impossible. Let Ferdinand VII. be free to grant his people the institutions which they can hold only from him, and which, by securing their repose, will dissipate the first apprehensions of France. From that moment hostilities shall cease. This solemn engagement, Gentlemen, I enter into in your presence."

Notwithstanding this appearance of determined coercion, a London paper says—"Many parts of the French King's speech seemed incomprehensible to the public, and the fall of the various funds has not been so great as was expected on the receipt of such an important document. An opinion now prevails that England will yet be the means of preventing a war by her interference," &c. But other papers consider war as inevitable.

A letter from Verona mentions, that the Archduchess Maria Louisa, widow of Napoleon Bonaparte, was seen at a musical party of the duke of Wellington's, familiarly leaning on the arm that guided the enemies of Europe so successfully against her husband's power and dignity! What would O'Meara say to this?—but "*varium et mutabile semper femina*!"

GODWIN, who still lives and thrives, has in the London press, a "History of the Commonwealth of England."

DOMESTIC.—Much damage has been done in various parts of the country by the late rise of waters.—The bridge on the Providence and Pawtucket turnpike road, the bridge on the old road commonly called Natick bridge, and a bridge in Olneyville were all carried away. A bridge at the Arkwright Factory, and one at the Hope Factory were injured, but are passable. Easton's dam in Burillville was carried away, which in its descent carried away a bridge on the Douglas turnpike. A bridge at Anthony Factory, a grist and saw mill at Coventry, R. I. a Methodist Meeting-house, a new toll bridge valued at \$10,000, and an Oil Mill at Norwich, Conn. and a bridge on the Cheshire turnpike near New Haven, have all been swept away by the deluge. One man was drowned at Norwich.

Hon. Benj. W. Crowninshield is elected member of Congress in Essex South District—and Hon. Jonas Sibley in Worcester South. In Worcester North no choice.

The Health Commissioners of Boston have offered \$400 dollars reward, for the discovery and conviction of any person or persons guilty of robbing the graves of the bodies buried therein.

A volume has been published in this city, entitled "Memoirs of the Life and Character of the Rev. John Eliot, Apostle of the North American Indians. By the Rev. M. Moore, pastor of the church in Natick."

An order has passed both houses of the Maryland legislature for a survey of a route for a canal from the city of Baltimore to the Potomac river.

Hon. Henry W. Dwight, member of Congress from Berkshire, Francis C. Gray and Abraham W. Fuller, Esqrs. of Boston, and Benj. R. Nichols, Esq. of Salem, have been admitted at Washington to practice in the Supreme Court of the U. States.

Dreadful Calamity!—The following is an extract of a letter from a gentleman in Mecklinburg, N. C. to a gentleman in Charleston, dated 11th February, 1823:—"One of the most afflicting scenes has occurred in this neighborhood—perhaps scarcely to be recorded. The house and property of Mr. Robert Walkup, was consumed by fire about 12 o'clock on the night of the 7th inst. What is most lamentable, five persons, principally young men, (four of them his own children) and a son of Mr. Huey, were entirely consumed in the flames as they lay up stairs!! The house caught fire by accident. Mr. William Flinn, brother to the late Rev. Dr. Flinn of Charleston, escaped by jumping out of the end window, but unfortunately broke his thighs. It was an awful scene to behold next morning."

The National Intelligencer informs us, that not one of the two hundred and five members of Congress has been dangerously ill, during the session which has just terminated.

We understand, (says the Richmond Enquirer) that Mr. Hugh Nelson accepts his appointment as minister to Spain, and will probably sail about the 1st of April.

The expense, so far, of the great Erie Canal, is five million, six hundred and three thousand, eight hundred and sixty-three dollars, and eighty-five cents; wanting to complete the same about two millions more. This estimate is given in a Report of the Canal Commissioners, published in the New York Advertiser, of the 4th inst. When this Canal is completed, says the Advertiser, the works at the Cahoon, Little Falls, the aqueduct at Genesee river, the embankment at the Irondequoit, and the excavation of the rock through the mountain ridge, will afford monuments of the powers of man, and the enterprise of the age, equal to the proudest work of Rome, Greece or Carthage, and scarcely inferior to the mighty emblems of Egyptian grandeur.

Fire.—The house and harness maker's shop of Mr. Whiting, in Concord, Ms. was destroyed by fire on Tuesday last.

Invention.—Adolphus Allen, of Georgetown, D. C. has received a patent for a Water Wheel, which he says is propelled by both ebb and flood tide,—will save the expense of a dam,—is not retarded by back water,—may be applied to any kind of machinery,—and is a very cheap wheel to erect. The Tide-mill, combining these and several other advantages which he enumerates, is certainly worthy of public attention.

Mr. Poinsett has transmitted to Charleston a valuable collection of minerals, collected by him while in Mexico. The Southern Patriot says that most of them are beautiful, some magnificent, and many that would add value to any collection.

The deaths in London during the year 1822, were 16,655: in Philadelphia they were 3,591; in New-York, 3,231, and in Baltimore, 2,319.

By a late report of the Methodist Episcopal Church, it appears, that the total number of Methodists, in G. Britain and her dependencies is 252,570, and the number of travelling preachers there, 970. In the U. S. west of the Alleghany, there are more than one hundred and five thousand members, about four hundred travelling, and nearly one thousand local preachers.

The Looking Glass Curtain at the N. York Theatre is 33 feet by 11 1-2, exclusive of the frame, contains 569 square feet of glass, and its whole weight is nearly two tons.

CONGRESS has finished its session, and, we believe, all is well. There has been but little vehement debate, and very few attempts at displays of oratorical powers. A bill for the prompt settlement of public ac-

counts, and for the punishment of perjury has been passed. A bill has passed both Houses, which provides for admitting revolutionary soldiers upon the pension list, who have become reduced in circumstances, although they may have formerly possessed property sufficient to preclude their claiming; and the Senate has receded from a proposition to reduce the pensions 20 per cent. On motion of Mr. Lloyd, of Mass. it has been resolved that the Secretary of the Treasury be directed to cause to be laid before the Senate, at the commencement of the next session of Congress the amount received by every officer in the customs from his per diem, and every other allowance to which he is entitled, by his official employment, and whether any offices may be abolished consistent with the public interest. The Senate adjourned *sine die*, at a late hour in the evening of the 3d inst. A resolution passed the House by a vote, nearly unanimous, that the President be requested to make arrangements with other powers to put a stop to the Slave Trade, and cause it to be denounced as piracy, under the Law of Nations, by consent of the civilized world. A resolution passed, on motion of Mr. Fuller, requesting information from the President, relative to the pretended blockade of the ports of the Spanish Main, and what measures had been taken to obtain restitution of vessels of the U. S. captured by privateers, fitted out at Porto Rico, &c. The thanks of the House were presented to Mr. Barbour, the Speaker, and after the customary interchange of civilities, the House adjourned *sine die*.

BY T. C. FESSENDEN.

ON THE LAUGHTER OF FOOLS

A bunch of thorns beneath a boiling pot,
That flashes with a deal of crepitation,
Is like a fool,* whose days are spent in what
Johnson would call a state of *cachinnation*.
His features glimmer with some scurvy joke
His wandering wits have long been seeking after;
Then dies his "bolt," succeeded by a stroke
Of thundering self-congratulating laughter.
Elated by each would-be witty thing
He has *himself* the happiness of saying.
His throat and lungs so dissonantly ring
You'd think his kindred animal was braying.
And when some greater, and more noted dunce
Makes vain attempts at wit or repartee,
His grinning faculties take fire at once,
And one fool echoes to another's glee.
There is contagion in a great man's mirth,
Which all must catch who would be tho't genteel;
And when he says the silliest things on earth,
Salute him still with laughter's loudest peal.
Thus when the leader of a flock of geese
Pipes to his cackling comrades, one and all,
Each goose and goslin bids the din increase,
Till swells the concert with one general squall.
Too many a "pretty looking" Miss I've seen,
Whose every word was prefaced with a titter,
And thought it strange, with beauty's air and mien,
The cap and bells of foolishness should fit her.
Next to the villanous Sardonian grin,
The heartless laugh of pride and affectation,
To show white teeth, a dimpled cheek or chin,
Merits and meets the highest reprobation.
I've not the least objection to a laugh,
To chase the fiend of "loathed melancholy,"
But hate the howling of a biped calf,
Whose laughter sounds the trumpet of his folly.
E'en now and then a hearty ha, ha, ha!
Is well enough, in Chesterfield's despite,
But those who laugh, and cannot say what for,
In my opinion act like idiots quite.

* Ecclesiasticus vii, 6.

Providence never intended to make such a difference between creatures of his hand, as that some should live only to enjoy, while others lived only to be ministers of enjoyment.—Though in an advanced stage of society some must be exempted from eating their bread with the sweat of their brow, and be busied rather in intellectual than manual labor, yet it is an immutable decree that the oil of gladness shall brighten the face of industry alone.

The conversation of men of talents and information furnishes a delightful and profitable source of knowledge. In this way we may avail ourselves of that intellectual wealth which is more valuable than gold, and by the exchange of ideas a sort of mental commerce may be kept up, which enriches all the parties concerned.

The interests of agriculture, manufactures and commerce are so inseparably connected that any serious injury suffered by one of them must injure the others.

From the Emporium.

ITS ALL MOONSHINE.

When I see a young man pursuing a gay butterfly of a girl because she is beautiful, though she possesses none of the qualifications necessary to make a good wife, a good house-keeper, or a good mother—depend upon it he is grasping at a phantom—*its all moonshine*.

When I see pleasure hunters, and those who are seeking after happiness, plunge into dissipation; or seek gay and giddy company; or drink deep of the cup of sensual enjoyment, I feel for them; I know the disappointment that awaits them; these are not the pearls of price, that bring with them peace and content; they are worthless—they are *nothing but moonshine*.

When I see a gambler forever running to the billiard table, with eager hopes of making money thereby, and carrying with him the means by which his family can be supported, to squander it there; I think with a sigh how sadly that poor man mistakes the path of wisdom, and labors after that which is *all moonshine*.

He is grasping at moonshine, who strives to raise his consequence in the world by a suit of fine clothes, or an unpaid for sideboard; and so he is who aims at building a foundation upon which to elevate himself in the estimation of the world, on a few thousand of paltry dollars; for, as Burns says,

The rank is but the guinea's stamp—
The man's the gold for all that—

and none can ever become truly great but those whom nature has fitted to be so.

These are plain palpable cases; I have sometimes thought men were grasping at moonshine too, who attempted to live by literature, or make money by printing papers; or dreamed of collecting their debts or of receiving legacies in these times; yet as these may be doubtful, I will not persist in them.

Another Caution.—Two children were one evening last week nearly suffocated by inhaling the vapor from a pan of burning coals placed in a small bed chamber. During the absence of the parents, the children were put to bed in an apartment containing no fire place, about half a peck of lighted charcoal placed there to warm the room, and the door shut! A slight groan was accidentally heard by the only person awake in the house, who hastened to the chamber and found the youngest, about four years old, in a state of insensibility and entire prostration; from which by the use of the most active measures, he was not recovered until more than half an hour had elapsed. The eldest was faint and speechless for about the same length of time. Parents and others cannot regard this fact with too much concern. There is nothing more destructive to the vital organs, than the mephitic effluvia which arises from charcoal in a state of ignition.—*Nantucket Inq.*

Amidst all the singularities of the *Shakers*, they have some rules which it would be well for people of all denominations to adopt:—"It is contrary to order, or the gift, as they call it, (says Professor Silliman, in his Tour,) to leave any bars down, or gates open; or leave any thing they use out of its proper place; consequently they seldom have any thing lost. It is according to the gift, or order, for all to en-

deavor to keep all things in order; indolence and carelessness, they say, are directly opposite to the gospel and order of God; cleanliness in every respect is strongly enforced—it is contrary to order even to spit on the floor—A dirty, careless, slovenly, or indolent person, they say cannot travel in the way of God, or be religious. It is contrary to order to talk loud, to shut doors hard, to rap at a door for admittance, or to make any noise in any respect even when walking the floor, they must be careful not to make a noise with their feet. They go to bed at 9 or 10 o'clock, and rise at 4 or 5. Every man and woman must be employed, and work steadily and moderately."—Trifling as these rules may appear, their adoption would have a very important effect upon any household or community.

Sparrows.—It has been ascertained, as nearly as such things can be, that a pair of sparrows destroy in one week, 3360 caterpillars. We did not know before, but we should always remember, the obligations we owe to these little favorites of heaven.

While the celebrated Mr. Dodd was balancing between his inclination to marry, and his apprehension that he would be unable to maintain a family with his slender income, he happened, on looking out of his window, to observe a Hen, with a large brood of chickens, busily employed in supplying them with food by scratching, &c. This spectacle decided his mind in favor of matrimony. "If, thought he this hen, who could barely, with her exertions but a short time since, obtain a subsistence for herself, is now able to provide for her numerous offspring, surely I and mine will not be permitted to suffer."

When Cowper was made Bishop of Gloucester, an old woman who had been one of his parishioners at Perth, and a favorite, could not be persuaded that her minister had deserted the Presbyterian cause. Resolved to satisfy herself, she paid him a visit in the Canongate where he had his residence, as Dean of the Chapel Royal. The retinue of servants through which she passed staggered the good woman's confidence; and on being ushered into the room where the Bishop sat in state, she exclaimed, "Oh Sir, what's this?—And ye ha' really left the guid cause, and turned prelate!" "Janet (said the Bishop,) I have got new light upon these things." "So I see Sir, (replied Janet;) for when ye was at Perth, ye had but ane candle and now ye've got twa before ye; that's a' your new light."—(*McCrie's Life of Melville.*)

Tight Lacing.—It has long been a matter of regret with persons of good sense and good taste, that many of the females of this country injure their health and real beauty of form, [as the pressure generally forces out the parts unpressed] by the absurd practice of wearing tight stays. The folly seems now to have spread to the men, if indeed such blockheads merit that appellation. It is a fact that an *exquisite* fainted away on Friday in Bond street, and was assisted into a shop, where he was some time before he recovered. Medical aid was sent for, when it was ascertained that his stays were too tight.—*London paper*

FACTS AND OBSERVATIONS RELATING TO AGRICULTURE & DOMESTIC ECONOMY.

BY THE EDITOR.

A NEW KIND OF INDIAN CORN.

Mr. Daniel Burnham, of Newburyport, has given a statement of a new kind of Indian Corn which he has successfully cultivated. The following is an abridged account of its qualities. Mode of culture, &c. The seed was raised at Council Bluff, on the river Missouri, and was received at that place from the Maha Nation of Indians. The kernel is large, free from flint, and filled with a sweet white flour. It is generally eight rowed, but sometimes has ten or twelve rows. Mr. Burnham planted some of it last spring on rather a light soil, inclining to gravel, with a northern aspect. It had lain to grass for the two years previous, without manure, and the crops scanty. The sward was so tender and broken, and the plough clogged so much that it could not be turned so well as wished. It was harrowed, and holes made at the distance of four feet one way, and three feet the other. Five cords of common barn manure (about half new and half old) were put in the holes in a very coarse state. The greater part of the manure strong, but some feeble. Three kernels were placed in an hill, and nine quarts of seed were put on an acre and a quarter. The process of planting was not well executed. The ploughing and planting were done from the 4th to the 7th of May. To supply the deficiency of standards, occasioned by drought, about the 25th of May, Mr. B. planted seed in drills, from which he transplanted into the field from 450 to 600 plants, and from earing time to harvest the transplanted corn could not be distinguished from the other. The corn was hoed four times, without ploughing between the rows. The fourth time was merely loosening the surface of the ground and destroying the weeds. The appearance of the corn was unpromising till the rains had wet the manure. It then exhibited a very remarkable growth, and its luxuriance became so great that it was apprehended by many, that the crop was much at hazard. Some of the seed was planted in the drill method, each standard from fifteen to twenty inches sunder, and Mr. B. believes if the field had been planted in this form, the crop would have been more abundant. This method would give room and space to the shoots, but they were so crowded, by being in hills, that they could not have proper expansion. The height of the stalks was not much greater than that of the common corn, but above and below the ears they are much larger. It was not uncommon to see from three to five large shoots on a kernel, and on a shoot two good ears.

Mr. B. is of opinion that the best and most abundant crops may be obtained from mixed seed; and says, "What I mean by mixed seed is when the kernel has become in a degree flinty, from receiving the Pollen or Farina from our flinty corn."

The fodder on the field was abundant, and thought by good judges to be fully equal to two tons of good English hay. The time and labor

of cutting and curing the fodder three times as much as on common fields of the same size. The harvesting of the bottoms was about in the same proportion. The topping of the corn was done about the 20th of September. The harvesting from the 18th to the 24th of October. In husking of the corn two qualities were made. Of the prime corn there was 110½ bushels; of the inferior 7 bushels, making in the whole 117½ bushels. Mr. B. says, "I am decidedly of opinion that had the field been planted with any of our common seed under similar circumstances, from fifty to sixty bushels would have been the extent of the crop. The expense, he thinks, was not less than sixty-five dollars, including manure, land-rent, and every other expense. The field was in the middle of the town, was much exposed, and robbed of some of its best ears. It was thought that in this way it suffered a loss of at least three bushels, but this loss could not be ascertained, and was not brought into the account."

Mr. Burnham next adverts to some of the disadvantages attending this sort of corn; and says that the pure seed in some seasons would be in danger of injury, as corn is commonly played after husking, because the cob contains more moisture than that of our common corn. But he does not consider the mixed seed as liable to this objection; and observes that if it could be made certain that the pure seed would in all seasons, come to maturity as fully as our common seed, yet the mixed seed is to be preferred, and much more may be expected from it than from any corn we have among us. It weighed, when taken from the cob, 48 lbs. to the bushel, and when thoroughly kiln dried its weight was exactly 50 lbs. After drying, it was ground into meal, and tried in various ways for bread, and the result was much in its favor. It requires of boiling water, to wet a pound, six and an half gills. At the same time trial was made of some of our yellow meal, from the last year's corn, and it required four and a half gills to the pound.—See *Mass. Ag. Rep. for Jan. 1823.*

CARROTS AND RUTA BAGA.

The same No. contains, (page 281,) a statement of Gen. Hall, of Newton, giving an account of his having raised a crop of Carrots and Ruta Baga, from which we gather the following particulars.

After a very deep ploughing in April, fifteen cart bucks of manure were spread on the ground, and immediately covered with the plough.—About the middle of May the land was harrowed and then ploughed very deep in ridges, two feet apart. The seed was sowed in single rows on the top of these ridges, between the 21st and 25th of May; about a pound to the acre. The seed not being of the best quality, and the season unfavorable, it came up thin. The latter part of June, ruta бага were set in all the vacant places in the rows, where the carrots had not come up. The crop was gathered early in November, and the acre produced four hundred and thirty bushels of carrots, and two hundred and nineteen bushels of ruta бага, making six hundred and forty-nine bushels of both. The

value of this crop was estimated at \$140; and the costs of cultivation, &c. \$71, leaving a profit on an acre of \$69, without reckoning the worth of the tops.

The same No. of the Agricultural Repository p. 285 contains an account by the same gentleman, of the culture and produce of seven eighths of an acre of Indian Corn. In 1821, the ground was mowed, and produced about one ton of English hay. No manure was put on the ground that year. It had been laid down to grass eight years. In October 1821, it was broken up, and remained in that situation until the spring of 1822. The last of April, it was well harrowed with a sharp iron tooth harrow. After this a composition of three loads of night manure, mixed with nine cart bucks of rich earth dug from the side of an old stone wall, and ten bucks of summer dung from the cow-yard, were equally spread over this land, and immediately covered by the plough, ploughing across the furrows. Between the 6th and 12th of May, it was harrowed three times with the same harrow. Furrows were drawn north and south three and a half feet apart. No ridges were formed. Hills were then made with the hoe, in these furrows, two feet apart, not flat, but descending to the south, with a small bank of earth on the north side of each hill. This banking on the north side of the hill was only done on a part of the field. From this mode of planting I calculated two advantages; one, the sun would have a more direct operation on the hill; the other, the tender plants, when they first came out of the ground, would in some measure be guarded from the cold north winds. The corn was planted between the 15th and 20th of May, with four kernels in each hill, equidistant about five inches. It was ploughed and hoed three times, and at each time of hoeing the furrows were filled up and the ground left nearly level. The first ploughing and hoeing was the 5th of June; the second the 20th; and the third and last, the 5th of July.

"As the ground, by deep ploughing and hoeing, had been rendered loose, I was of the opinion, the hills would receive more nourishment and stand stronger, by the roots running under ground in the whole space between the rows, than by drawing the rich earth around the hills with the hoe, as is the usual custom. Besides the dews, the light rains and the sun have a much greater effect on the roots, when the ground is left in the manner I have here described, than when the earth is banked up around the hill. And further when high hills are made, the roots running horizontally will run out of the ground and perish."

"Every thing which had been anticipated with respect to the manner in which this field of corn had been planted and cultivated was realized. While other corn in the same enclosure and near it, was perishing during the dry season, not a leaf in this field even curled, and no part of it, in the least degree suffered by the drought. The second week in October it was harvested, and from this seven eighths of an acre, was measured one hundred and ninety-two bushels of ears, after the husks were taken

were taken off, equal to ninety-six bushels of shelled corn. The whole was sound, and suitable to grind into meal, excepting three bushels of ears."

The value of this corn, including four bushels of beans, raised by way of experiment on about half the piece, was \$22.56; the expenses of cultivation were \$57.75, leaving the neat profits of seven-eighths of an acre of Indian corn, \$61.81.

From the Old Colony Memorial.

Sir—I am a plain countryman, constantly employed in the labors of my farm. My journeying is pretty much confined to a ride once in a year or two to the cattle show, and my reading to an evening recreation (after the cattle are taken care of, and the children put to bed) in looking over the Old Colony Memorial, or the Agricultural Repository.

In reading the latter work, and in my occasional visits to our shows at Brighton, I have been forcibly impressed with an idea that the principles on which the premiums to animals are awarded are erroneous.

I must beg with all possible humility and submission, to express my dissent from the opinions of gentlemen who have done more essential service to their country, than any set of men since its settlement; I mean the Trustees and leading men of our society. But they are in the higher walks of agriculture. They improve soils, and make compost, and breed cattle in their libraries or their flower gardens, and I apprehend it is from such plain working farmers as myself that they will be willing to receive hints.

My objections are to the high premiums uniformly given to imported stock, and the general preference of huge, overgrown, high fed animals. Cannot the native stock of cattle in this state, (by liberal patronage) be improved to as great perfection as any that can be imported? It was originally from Devonshire, and is (I believe) of the best breed of Great Britain. But even if not, it seems to be proved by the noble experiments made there during the last half century, that very little (comparatively) depends on the original stock, and every thing on a careful and skillful selection of the best breeders. If this state should ever have the honor of producing a *Bakewell*, our society (on its present plan) will not be entitled to a whit of credit for patronage, or encouragement. We reverse the grand patriotic maxim, and give *hundreds* for tribute to foreign animals, but not a *cent* to defend or improve our own stock. Like the silly country belle, who sends all her substance abroad to purchase a bonnet of chin-chilla with ostrich feathers, instead of making an article every way more tasteful, elegant and comfortable, of the down from her own turkeys.

This subject has been suggested to my mind at this time, by the very able report, No. 1, of the cattle show at Brighton last fall. The author of that report has proved himself one of the most eminent of patriots in devoting his great talents to the agriculture of his country. His ardent zeal and perfect disinterestedness, cannot be doubted, and I certainly should never venture to differ from him, as to the justice of his awards. It is to the policy of the rule, not the fairness of the awards, that I wish to draw the attention of that gentleman and the society.

He intimates in his report, that any one who

observes the continued crowd around the pens which contain the imported stock, must be satisfied of the public preference. But I would ask, is this an evidence of preference, or only of wonder? Put a man of the most perfect form and stature in one place, and the most hideous giant in another, and see which will attract the greatest crowd of observers.

I was at the show in 1819, and recollect a cow was exhibited by Mr. Coolidge, said to be of the Holderness breed. She was a long legged, gaunt, awkward creature enough; with a bag as large and as white as a milk-maid's fist, and teats like her taper fingers. The people did indeed crowd around her pen, but it was to search in vain for some latent excellence, and then indignantly exclaim,

"The thing is neither rich nor rare,
I wonder how the devil it came there,"

but this cow was far-fetched and obtained a premium.

I observe the first premium for a bull in the aforesaid report, is to one fifteen months old, weighing 1213 lbs. and the second to one seven months old, weighing 735 lbs. Now, Sir, is the extreme bulk of such animals, any excellence in them, and yet it would seem that their weight was the cause of the premiums being awarded to them. Let the honorable gentleman to whom I have alluded mix as I have done with the multitude without the pens; he will be satisfied that plain practical farmers, while they admire at the overgrown, pampered beauty of such animals, would no more think of taking them for their own farm stock than they would go to a turtle feast, and select a fat Alderman for their working farmer. They observe with wonder, what may be done by dint of high feeding and rubbing, and of what exquisite polish to hide of a bullock is susceptible; but without the least disposition to profit by the observation.

I have extended these remarks much beyond what I at first intended, but if they should be taken in good part by the great folks of our society, and induce them to take into consideration the expediency of giving generous premiums to the best animals, without regard to the place from whence they came, or to their being of enormous size, it will highly gratify me as a member of their society and an Old Colony Farmer.

REMARKS ON THE PRECEDING ARTICLE.

FOR THE NEW ENGLAND FARMER.

A writer in the Old Colony Memorial, a very respectable Journal, has expressed his disapprobation of the conduct of the Trustees of the Massachusetts Agricultural Society in their distribution of premiums on Cattle. We shall pass by the witty remarks on the "*Gentlemen Farmers*"—they are ready to submit to be the butt of the real farmers of the East and of the West, and will patiently pursue the great interests of Agriculture, unmoved by ridicule. When they are told that "they improve soils, and make compost, and breed cattle in their libraries, or their flower gardens," they will make no other reply, than by saying, if Mr. Quincy's 30 acres under root culture in one season—Mr. Pomeroy's—Mr. Welles's,—Mr. Parsons's, and Mr. Prince's extensive fields, are only "flower gardens," we wish there were more of them, and we doubt whether their products would be so great as they have been, if their "compost" was confined to their "libraries." As to their cattle, they raise them precisely as we presume

they do in the Old Colony, on hay, grass, and roots. If there is any other mode known to the gentlemen of the Old Colony, cheaper and better, we should be happy to hear an account of it. That they feed their stock better, we think probable, but still any man conversant with the mode of keeping stock in England, must admit that even to this day the most careful of us do not feed our cattle so well as in that country. We are ready to say, that we think the greatest defect, which still exists in this grazing State is the parsimony of our farmers as to food, and attention, particularly as it respects young cattle and milch cows.

But the principal object of my present remarks, is a suggestion, directly applied to the Committee, on the larger class of animals, of which Committee I have been for several years the Chairman. The criticisms of the writer to which I shall confine myself, are the following: "My objections, says the writer, are to the high premiums uniformly given to imported stock, and the general preference of huge, overgrown, high fed animals. Cannot the native stock of cattle in this State (by liberal patronage,) be improved to as great perfection as any that can be imported?" The writer then proceeds to state that our race of cattle is of the Devonshire breed, and that it is proved by the "noble experiments" made there (in England) during the last half century, that very little depends on the original stock, and every thing on a careful and skillful selection of the best breeders.

Now it so happens that the Trustees of the Massachusetts Agricultural Society have always entertained precisely the same opinions with those expressed by the writer in the Old Colony Memorial, though it seems from the want of precision in their expressions, or from some other cause, they have not been understood.

The writer alluded to is mistaken as to the facts in the following particulars:

1st. High premiums are never given to imported stock, when put in competition with our own. There never has been a competition between imported stock, and our own stock, at the Cattle Shows. Imported stock are not candidates for any premium whatever. The error of the Old Colony writer has arisen from his confounding the reward we pay (not out of the legislative funds, but our own,) for the importation of a few improved animals.

Thus, we encouraged the introduction of Merino Sheep—and recently of the Dishley and long-wooled Leicester Sheep—and we also offered a reward for the importation of the improved breeds of Cattle; but they do not compete with our own in any case. If Bakewell and Princeps and their successors have, during a period of fifty years, so improved their stock of horned cattle, as that a bull of the best improved race will sell for forty times the price of a common bull, is it not judicious in us to save a part of this long process of improvement by importing one already improved?

2d. The second error into which the Old Colony Farmer has fallen, was in supposing we preferred huge, overgrown animals. So far from this, we have done every thing in our power to discourage such animals, both by our remarks, and our premiums. We give the preference always to animals of little bone, and great flesh, which shew an early and ready disposition to fatten.

3d. He was mistaken in supposing the Trus-

es had any thing to do with these questions, there is but one Trustee on a Committee, and ordinarily gives no opinion. The persons who decide are farmers, and persons who put up cattle for beef. A man who buys 500 oxen a year, handles them, and has them cut up, must be a better judge than any practical farmer owning 20 or 30 head of cattle. Such practical purchasers are not apt to mistake a long, lank, raw-boned animal for a profitable one.

We are happy to find that we agree entirely with the Old Colony Farmer in the principles which should govern us. The only question is, *de facto*, whether we have acted up to our principles? This rests, not upon the Trustees, but on the gentlemen selected for their skill.—It is true that the crosses from foreign breeds have been generally preferred, but it was because (not the Trustees) but the committee of dependent Farmers thought them generally better formed—of finer, and more delicate limbs—better adapted to fatten, and on the whole better animals, than the native ones offered at the same time. So far is it from being generally true, that these animals were more huge or overgrown, it is a fact, that the native bulls are often much the most gross, heavy and coarse. It should be recollected, that almost every premium has been awarded either to native animals, or to those of half-blood, one part being native.

The only object of these remarks is to promote the cause of truth, and to remove unfounded prejudices.

The Chairman of the Committee on Premiums for Cattle, at the last Brighton Show.

THE EDITOR OF THE NEW ENGLAND FARMER.

DEAR SIR—How is it that the Trustees of the Massachusetts Society for promoting Agriculture, do not encourage the breeding of that useful animal the Horse—an enquiry frequently made, particularly by the friends of the Turf. One of Mr. Lowell's reasons was itself conclusive—that no encouragement was necessary, for good horses would command a great price in any market in the United States. On reading the American Farmer of Feb. 28th, No. 19, vol. 1, p. 339, I perceive a Virginian addresses the Editor on the breeding of horses in that state, and furnishes a precious conclusion of facts; if you think as well of it as I do, wish I would give it a place in your next paper, and oblige your friend and humble servant,

GORHAM PARSONS.

Brighton, March 10, 1833.

From the American Farmer.

Virginia, February 14th.

MR. SKINNER—The symptoms of a revival in the long laid spirit of the turf, together with several pieces, which have appeared in the public prints, upon the improvement of our stock of horses, setting forth erroneous views on the subject, as I conceive, will be my apology for troubling you with the following remarks, for the American Farmer, should you deem them worthy a place in its columns.

Perhaps the novelty of the opinion, that the state and passion for racing, so far from contributing to, has retarded the progress of improvement in our horses, may attract some curiosity; but, when it is stated further, to be an opinion deliberately formed, upon an experience of twenty years breeding, commenced under the full impression, that the English race horse was the perfection of the species, I may hope for patient reading, from all whose minds are open to conviction.

The essential points of the English turf horse, are, a thin and deep shoulder, narrow breast, delicate clean legs, long in the pasterns, a broad or wide hock well let down, and a thigh or haunch more remarkable for length than bulk. A long back more common than a short one, and a body oftener flat sided than round—and, finally, the taller the better, but not less than sixteen hands, for a first rate courser. This carcass—and set of limbs—is covered by a skin so thin and a coat of hair so fine, as to express the very veins as well as the muscles, beneath the delicate integument.

A long, low, slouching carriage, in every gait, follows as a consequence of the above form and proportions. The very best calculated, truly, for a four mile heat, on a smooth course, but that it is totally unsuited to the road, I will use no other argument to prove, than one which all sagacious readers will have deduced already from the premises, if it were not established by the known general rule, that a race horse is a stumbler.

Equally disqualified by the nature of his skin, is he for the harness—the slightest pressure producing a gall—and as unsuited are his long legs and limber pasterns to the frequently deep state, and irregular surface of our roads, that a horse of compact form and nimble movements, with a strong coat on his back and shoulders, and not within a hand of his height, will always be found more lasting and serviceable. Moreover, the running stock are frequently vicious and unmanageable, and very generally so shy and timid, as to render them in a great degree unfit for the purpose of war. In England, the horses of this strain, are rarely used, but to contribute to the most ruinous and expensive of their pleasures—and I am strongly inclined to the opinion, that the highest style of the English race horse, which it has been a very prevalent folly with us to take as our model, is a forced anomaly in the species, introduced and propagated by a prodigality of attention and expense, such as the enormous wealth of the nobility of England is alone able to sustain.

The noble animal to be cherished as the companion of our manly pleasures and glorious achievements, should be of the form for power, docile and courageous in his temper, quick, firm and clear in his movements. These properties are found for the most part connected with roundness of contour and strength of articulation; with a texture of skin and strength of coat, which will bear the pressure of the saddle and the friction of the harness; and as far as my experience has gone, it is rare, that you find a horse of this description exceeding fifteen hands and a half high. All the finest horses in the world, may be traced to the Arabian stock. The English race horse is of Arabian descent, with the peculiar objections above described, but which I am happy in believing, the Author of Nature has kindly decreed shall never be made indigenous to our soil and climate. The English blooded stock, tho' kept pure and uncrossed, essentially change their character after a few generations in our climate, and manifestly for the better, as to every rational and useful purpose. The native Virginia horse of the third and fourth generation, from the light and washy figures of the purest English stock,

* It may be safely asserted, that racing has put more of the estates of the English nobility to nurse, than any other single cause.

become less tall, with more bulk, shorter and stronger jointed, with a thicker and coarser coat; with these changes, there is a correspondent one in gait and carriage. They are more active and sprightly in their movements, and better able to stand the vicissitudes of our climate. Our food, our climate, and our management are quite sufficient to account for these changes. Our maize, which forms three-fourths of the grain fed to our horses, in the parts of the states below the mountains, (where our best horses are found,) is by far more nutritious than the oats of Europe, or any other grain used for the food of horses in any other country. Our young horses are more exposed to the weather, and when taken in hand are not put into close and warm stables, and clothed, as is generally the case in England.

It is a fact well known to the amateurs in this favourite animal of the Virginians, that we abounded much more in a fine race of horses for the saddle and the harness thirty years ago than at this day. This was precisely the period when the descendants of some of the best of the English stock which had been early imported into the colony, had become acclimated and fully naturalized—and I have but little doubt had we proceeded upon the rational plan of breeding solely with an eye to qualities for service, rather than the worse than useless properties for the turf, Virginia would now have had the most valuable race of horses in the world; but unfortunately, about twenty five or thirty years ago, the late Colonel Hoopes, of Bowling Green, of well known racing memory, and many others, availing themselves of the passion for racing, inundated the state with imported English race horses, well nigh to the extinction of the good old stocks of Janus, and Fearnought, and Jolly Roger, and Mark Anthony, and Selim, and Peacock, and many other but little less tried and approved racers. The difficulty of getting a fine saddle horse has of late become a general remark; and when you do find one, with the exception of now and then a Diomed or Bedford cross, you rarely hear of any other of the late imported blood in his veins. The descendants of Cormorant, and Sterling, and Spread Eagle, and Seagull, and Buzzard, and Dare Devil, and Oscar, and Saltrum, and twenty others which might be added, are either extinct or still languishing through the probationary term of over pampered exotics—such as have the stamina to go through the trial and become naturalized to corn and fodder in log stables, may form the basis of some future good stock; but, I dare say, we shall never hear of many of them again. Upon this subject, few perhaps, have had more experience than the author of this communication; having labored under the racing mania for a term of years, that almost reduced him to a race of worthless garrans, though none of their distinguished dams cost him less than a hundred guineas a piece, and were certified for, through an uncontaminated succession of famous English ancestors down to the Godolphin Arabian. Fortunately, however, about twelve years ago, I became convinced of my delusion, and since I have been endeavoring to get back to the well known old stocks, and breeding exclusively with a view to useful qualities, the result has answered my most sanguine hopes.

One of your constant readers, with a full share of Virginia fondness for horses.

REMARKS

ON THE IMPROVEMENT OF CATTLE, &c.

In a letter to Sir John Saunders Sebright, Bart. M. P.
by Mr. John Wilkinson, of Lenton, near Nottingham.

Let each succeeding race employ your care,
Distinguish which to slaughter, which to spare;
Mark well the lineage,—let the purest make,
From purest blood, its just proportions take.

(Continued from page 262.)

APPENDIX TO THE PUBLIC.

It was highly gratifying to me at first, that many who have given their most serious attention to these matters, should have thought me in any measure qualified to elucidate a subject of such vast importance; but it was still more so, when after repeated solicitations, and I had at length complied with their request in offering my remarks, that the remarks themselves should have met with so much approbation from the public at large. Nor can I pass over the pleasure I have felt at being told, that they have already been of considerable practical use.

I have had reason to hope indeed, that they may have been of some slight service in directing the attention to the shapes of Cattle, for laying on the greatest quantity of meat in the prime parts, and in describing the best kind of flesh,—in shewing, that the fattening qualities of Cattle are not incompatible with the milking, and that the latter therefore ought by no means to be neglected,—and lastly, by pointing out the absurdity of keeping an inferior animal on pretence that it is well-bred.

In these particulars, I had observed many and grievous mistakes; and it was really lamentable to find with the present desire of improvement, that some had given large prices for animals, that were in themselves so extremely defective. It happened, therefore, that the end proposed in several cases, was not answered; and a consequent disappointment was thrown in the way of future exertions. And hence it became desirable to give, in the most plain and simple terms, such general rules, as might enable every one in some measure to judge for himself.

In questions of a practical nature, experience must be attended to; and results carefully observed: for theory without practice, is generally idle and visionary; and of little or no use when put to the test. But then it is also to be remarked, that along with practice, the most patient thought and careful reflection, not only may be, but often are of the highest importance. In the case before us for instance; to know what would be the best possible shapes for Cattle in their several parts (whether such animals could be exactly found or not) would be one of the surest means at length to obtain them; by selecting those continually, which most nearly approximate to the form itself.

Were people to think more indeed, errors in opposite extremes, would not so frequently follow each other. Light fleshed animals would not have been approved of for a single moment merely because some that had plenty of flesh, were of a hard and bad quality. Of such, the trial need never have been made: it was obvious, they would not answer. By a little reflection too, it never would have been concluded, that Cows that were great milkers, could not also be quick feeders; for this at least could have

occurred to the mind, that when they were wanted for feeding, they would at that time be dried of their milk; so that the objection, urged against their feeding, would have fallen to the ground, even on its own principles. Again; most hard fleshed Cattle, have also thick, hard skins; hence many have sought for such as have their skins remarkably thin, and these are too often of a very delicate and tender constitution. The truth is, though hard fleshed animals, are generally covered with a thick, hard skin; yet there is a skin of a certain substance, which is by no means hard, but of a rich and mellow feel, covering an animal exceedingly inclined to fatten. And these I think are very greatly to be preferred: for every one must perceive, that the skin is of the highest use to protect the animal from those various changes in climate, it is obliged to undergo.

But lastly; of all the errors arising from a want of due reflection only, (independent of a proper attention to facts) none can possibly be greater, than that of keeping an inferior animal to breed from, on pretence that the animal itself is well-bred. It is observed by the advocates of this system, that *breed will shew itself*; that *the qualities of the ancestry will be seen in the future stock*. True; and will not this law of nature then apply to inferior animals in the pedigree, as well as to the superior? It unquestionably does. In theory, there is the same reason for its holding in the one, as in the other: and in practice we find that this is the case. It is strange that persons who have fallen into this error, and have brought forward the foregoing argument in their defence, did not immediately perceive, that the argument was quite as much against them, as they took it to be in their favor. From this mixture of good and bad animals in the ancestry of some flocks and herds, it happens, that while we behold in the progeny some that are good we also find some that are very deficient; and on such stock, little or no dependance can be placed. I observed in the remarks themselves, that a bad animal has scarcely ever a good pedigree; that on examination, we shall generally find something wrong in the ancestry at one point or other: or that if such a case actually occurs, it is most probably owing to some accidental circumstance, such as illness, or injury received by the parent while pregnant, &c. &c. But supposing such a thing really to happen without any such accidental circumstances at all, then it is a deviation in nature, I think not less remarkable, than that a pair of rooks or blackbirds should produce a nest of young ones that are perfectly white. Whatever may be the real cause however of the birth of an inferior animal, we shall perceive in each particular case many and strong reasons why it should not be kept to breed from. If it has arisen from illness in the parent, its own constitution is most likely weakened and injured, and this in all probability would again be entailed on its offspring. If it be one of those strong deviations in nature, which may possibly occur (though I am persuaded very rarely takes place) without our being able to account for it according to the common course of things; then we know, as in the example given above, that this deviation, however great, may be continued; that white roots being once obtained, a breed of the same description might by care be at length established: and moreover without

this care, that the white color would be almost certain to shew itself in some of the progeny. And by analogy, the same thing would appear reasonable with respect to deviations in malformation or shape: but what a practical man is most concerned with, it is so in fact. That the qualities as well as the good, are liable to be inherited, was a circumstance well known to the ancients, and has often been remarked by their best poets.

In bringing forward these examples in order to shew that if practice were accompanied by more reflection, many errors would certainly be avoided; I have at the same time selected those of this particular nature, the better to illustrate my own subject. But the observation itself, one of so general a nature, that it applies to most all our undertakings. I have chosen such moreover, where the errors have not only been frequent; but where some of them are of the consequence, and particularly the last, where wherever a due attention shall not be paid to this part of the subject, there, much progress cannot reasonably be expected.

I stated in the remarks, that no animal could be depended upon for breeding, but such as in itself good, and is moreover well-bred in the strictest sense of the words; and I am persuaded that experience will bear me out in the assertion. I might also have added, that when such and such only are used for this purpose, need not be in the slightest fear of disappointment. Horace, a celebrated Roman Poet, well understood the importance of this when he expressed himself in language to the following effect; of which this translation may be given

The brave are offsprings of the brave and good:
In steers and steeds we trace the worth and blood
Of high-bred sires; "nor can the bird of Jove,"
Intrepid, fierce, beget th' unwarlike dove."

As if the poet had said; that where the ancestry is really good, there is almost as little reason to expect, that the valuable property of the parents should fail in the offspring as there is to expect that an animal of one kind, should ever be the parent of that another.

From what has been advanced on the inheritance of peculiar qualities, it will immediately appear in the selection of Bulls, that besides attending to those properties which belong to the male, we ought to be careful also, that they are descended from a breed of good milkers, least if we wish the future stock to possess that property. It is of far more consequence indeed, that this should be the case with respect to the Bull, than it can possibly be with respect to an individual Cow; because the whole of the descendants will be affected by it.

Since the whole number of good Cattle in the country is at present unquestionably very small; I shall add a few words on what appears to me to be the most probable means of increasing it; but particularly with respect to the use of Bulls. I mentioned in the remarks, that those districts where valuable animals were first introduced by Gentlemen themselves, thought it would not be a bad plan to allow the Tenantry to improve their own stock at a certain reasonable rate; and gave my reasons for the foregoing opinion. I find however, that

* The Eagle.

† The part between the inverted commas, is taken from the translation of Francis.

the spirited Gentlemen who have obtained bulls of me, being anxious to benefit their immediate neighborhood, and particularly solicitous for the welfare of their own tenantry, have allowed such to send their Cows to the Bulls without any compensation whatever. There can be no doubt but that such a disposition does them the highest credit; but still I think it would be more beneficial (I speak not their own account, but for the neighborhood large) to take a certain compensation; and not such a one, as should at least keep away the very refuse of the Cattle.* Nor do I think it a bad plan, beside the usual charge for each individual Cow, to have an extra sum for all bull calves that are uncut at four months old. Where the cows are tolerably good, even not remarkable for their breed, the heifer calves produced by sending such to valuable bulls, may be very useful for future stock; though they cannot by any means be so well depended upon for breeding, as if their Dams had been thorough bred also. But such stock cross a time after time with the thorough bred Bulls. It soon arrive at a very considerable degree of perfection. If however persons breed from half bred Bulls as well as half bred Heifers, it is obvious that there is no continual advancement in blood; the progeny will still be only half bred. Why I should admit of this partial improvement from the Heifers, is this; because in the present state of things, a sufficient number of really valuable animals cannot be procured; and by crossing them in the way I have just mentioned, each succeeding race would no doubt be considerably improved. Still however the value of such a cross must depend entirely on the excellence of the original stock.

Cows, put to the thorough bred Bulls; I must again repeat, that I think very bad ones are better excluded altogether. My reason for advising to charge an additional price for the bulling of any Cow, if the calf itself be reared as a Bull, is to prevent as much as possible the use of Bulls that are descended from moderate females; for on account of the expensive use that may be made of a single Bull, the good or harm done to a neighborhood, according as the Bulls are good or bad, well bred or not, is much greater than most are apt to imagine.

But with every precaution, I know from what I have frequently seen, that it is no easy matter to prevent the use of bulls, descended from inferior cows. In the case of my bull Alexander (an animal well known in most parts of the country) when he was allowed to serve other persons's cows, I found the greatest possible mischief arising from it. For as it frequently happens, that my applications for cattle are greater than I can supply, many were induced to give large prices to others for half bred ones descended from him; when the fact was, some of

* Others have taken a fair price for the general use of their Bulls, but have allowed their own tenantry to send Cows for something less, which I think is by no means a bad plan; as I think this liberality, while it encourages the tenantry, affords the landlord the security I mentioned in the conclusion of the remarks; and to a man of a noble disposition, the gratification of seeing the improvements made on his estate. I presume not however to dictate the best plan for each particular case; that may vary according to circumstances. But I do think in all cases, some plan should be adopted to keep away the Cattle just mentioned.

their dams were of the worst and most inferior kind. That the public therefore, might no longer be thus imposed on, I very soon determined to keep him entirely for my own use. And though while a yearling, he earned me so large a sum of money; and after I had made the restriction and his stock began to be seen, applications were made to me from various parts of the country, in some cases offering any sum that could be asked or given for the use of a bull; yet I have seen no cause sufficient to induce me to alter from my first determination; nor do I suppose I ever shall.

In districts where the tenantry themselves procure good cattle, there I should by no means advise the landlord to allow the neighborhood to send their cows to a bull of his own at an under price, if he possessed a valuable one; because this would have a tendency to damp the emulation of the tenantry among each other, and to deprive the most spirited and skillful among them of that reward they are so justly entitled to. One thing is very certain, that there is a greater desire for improved stock in the present day than was ever before known. Nor can we be at all surprised that this should be the case; for those who have had an opportunity of seeing the vast difference that is made in the return between good and bad animals, would naturally be very anxious for the former, though they may incur a little expense in the first establishment of a breed.

And here I cannot refrain from passing my highest encomium on the board of agriculture. The liberal premiums proposed by it, on various occasions, together with the enlightened experience of many of its members, have, and I trust will ever continue to be productive of the greatest good. When we behold men of the rank and opulence of its noble president* devoting so much of their time and attention to the public welfare; the inferior orders and middle classes of society, ought, surely never to think it too much to exert themselves on their own behalf. Such noblemen and gentlemen by their various experiments are continually discovering something new, and of importance: the experiments that fail, fall entirely on themselves; while those that succeed, are generously made known to the public at large. By their rank in life, they render the pursuit of agriculture respectable; and by their liberal assistance, they rouse many to a degree of exertion which is not unfrequently crowned with success.†

Whoever wishes to make himself acquainted with the value of fat and lean cattle exposed for sale, at the different markets and fairs in various parts of the country, cannot do better, than consult the *Farmer's Journal*. This is a publication indeed, that no agriculturist ought to be without. To a man of business, its trilling expense is soon repaid by the correct information he weekly receives of the prices of not only one kind of agricultural produce,‡ but of almost ev-

* The Right Honorable the Earl Hardwicke.

† I might here mention the aid afforded to the improvement of stock, by the various exhibitions in almost every part of the country, established either by the munificence of distinguished individuals, or the joint contribution of the respective members—in most of which societies, we generally perceive the nobility and gentry of the neighborhood come forward in such a way, as does them the highest credit.

‡ The concluding page of each journal contains a list of the prices of all kinds of corn, seeds, meat, hay,

every description whatever; by which means he will be enabled to adopt the more prudent measures, as to such articles, as he himself may have to dispose of. It contains moreover a fund of information on practical subjects, belonging to agriculture, from the joint contribution of the most scientific men of the day. To mention the signatures of Sir John Sinclair, Mr. Hall, Mr. Blakie, and Mr. John Elman, Jr. might alone suffice; but to these, if need be, many more of the first note, could be easily added—the whole being arranged and corrected under the inspection of an intelligent editor.

I have only to add again in conclusion, how much real pleasure it has given me, to have received the approbation of so many intelligent men; and most sincerely wish that my "remarks" were still more worthy of their attention. And I can assure all, if specimens of cattle please them better than description, that they are extremely welcome to the sight of any, or the whole of mine, at any part of the year.—For as I never make a point of forcing them by extra keeping, I am quite regardless of the time they are shown. The improvement of the stock of the country, indeed, is a subject of such vast importance, that it can never be made too clear; and on this account, I shall always be happy, to adopt every means in my power, to facilitate so great an object.

Should this pamphlet fall into the hands of any, who have been waiting for heifers from me, and have thought themselves neglected by not receiving them so early as they might imagine; I have only to assure them that it has arisen from others, who have given a prior order, either taking more than I at first expected, or putting in their claim for a second supply; and that every attention has, and will continue to be paid, to serve all as soon as possible. I ought perhaps here to mention generally, that from the great demand I have, my plan has been, if any one applies at a time, when I am unable to spare any, to make a memorandum of the application, if wished; and then to send word as soon as I have such to part with, as are likely to suit.

From this demand too, my bulls and bull calves are disposed of at all times of the year; several of the bulls are frequently sold or relet in September, soon after their return from former engagements; and many of the bull calves often disposed of during the first summer, that is, as soon as they have been well reared and are ready to send off. The plan that many have adopted therefore, that live at a distance, is to write to me to know if they can be supplied with a bull calf, or heifers; and if not, how soon they can. In which case I describe what I have, if any to part with at the time, what are coming forward, and how soon they will be ready: so that by this means, they have the trouble of one journey only. Perhaps no gentleman, who takes this plan, will think it too much to pay the postage; for though the expense of each letter is but trilling, yet from the number I receive, it would soon amount to a considerable sum. Some who live at a great distance and have seen the cattle I have sent to neighboring places, have left the selection en-

— straw, &c. &c. both in London and also in the most important of the country markets. Nor is it of small moment, that if there be a sudden rise or depression of the various articles, the cause is generally adverted to

tirely to me; but though I have had the pleasure of finding, that those I have sent have given great satisfaction, yet I very far prefer, wherever it is practicable, that all should make choice for themselves. And I should still recommend but a small number at first, not merely on account of my own convenience, owing to the demand I have; but because persons have then an opportunity, at no vast expense, of seeing whether they are the kind of animal they wished for—and as I have before said, conviction which arises from experience, is always greatly to be preferred. To me however, it has been highly gratifying to find, that in so many cases, where they have once been established, a fresh supply has so soon been wished for. I think therefore, a bull and one or two heifers might suffice in most places at first, where the trial is made; and in some, a young bull only.

From the American Farmer.

CEMENT.

However valuable Mr. Skinner's paper continues to be, I find all his receipts are not infallible: particularly that on ashes and salt, for cracks in stoves, as I find after drying, it crumbles off, and weeping eyes are again renewed, but if you add a portion of Plaster of Paris with a little iron filings, it will produce a substantial cement, and the lustre of your eyes be preserved from the great annoyance of smoke.

Plattemore.

M. O.

From the American Farmer.

Answer to a "North Carolina Farmer."

The best preventives against fleas in hogs, lice in cattle, and ticks in sheep, are corn meal, and care. The best remedy for the evils they create, is a strong decoction of tobacco, obtained by boiling. Hickory ashes, thrown upon swine, not only assists in destroying fleas, but in removing cutaneous diseases, by causing the animals to rub themselves frequently.

CURWEN.

Philadelphia County, March 5th, 1823.

From the Connecticut Herald.

A few weeks since, an obituary notice of Mrs. Long, of Concord, N. H. went the rounds of the newspapers. Her death was occasioned by using sugar adulterated with white lead. She died with aggravated symptoms of *Colica Pictonum*, or Lead Colic. Since then a family in the same town, (Mr. J. Wheeler's.) have been severely afflicted in the same way, from the use of apple-sauce kept in earthen pans, glazed with red lead—the youngest member of the family has died. There is a notice of the case by Dr. Long, and a report by the central Medical Society, N. H. on the subject, in the *New-Hampshire Patriot*. Dr. Long gives the following as the history of the symptoms:—

"Among the first symptoms noticeable in this disease, are a tightness or uneasiness across the stomach and bowels, costiveness, faintness, giddiness, numbness in the extremities, pains shooting through the head, neck, back, and limbs, which are often thought to be rheumatick. And in the further progress of the disease, slight sickness of the stomach, thirst, anxiety, general languor, yellowness of the skin—and if not relieved, worse symptoms ensue; such as obstinate costiveness, a frequent but ineffectual desire to evacuate the contents of the bowels,

constant nausea and vomiting, violent pains in the stomach and bowels, with the sensation of their being knotted up and strongly drawn upward and back; epileps-y, delirium, palsy, strong convulsions, and death."

When a family or any member of it, is affected with such symptoms, they may suspect the action of lead poison, and ought to examine their food, drink, and utensils for cooking or containing them. They ought too, to make speedy application for medical assistance, as this is a case of peculiar obstinacy and danger. In the case above mentioned, the glazing of the pans was in part entirely destroyed, and the inside of the pans reduced to the state of clay. Lead is used in forming pewter vessels, in soldering tin ware, and in glazing earthen ware. White crockery is glazed with white lead; common brown ware with coarse red lead, or oxyd. Stone ware is glazed with salt, and is therefore not liable to these objections. Lead is easily corroded by any thing acid, such as wine, cider, pickles, preserves, and by oils, when rancid. These articles then contain the lead in solution, which may be detected by a solution of liver of sulphur, (*hydrosulphuret*.) in the form of a black cloud or precipitate. Wines are often sweetened by sugar of lead, when *pricked* or acidified. This has been made a gainful, but most nefarious speculation. It has been one of the thousand guilty means of gathering wealth from the wretchedness of others. From the case of Mrs. Long, it appears that the same adulteration has been practised in sugar. Those who value their health, (and there is assuredly nothing of higher value, for one half of our moral evils are evil from their destroying health;) those who prefer a sound constitution to any momentary gratification or fancied convenience, ought to take care how they suffer this insidious poison to taint their food, and infect their luxuries. Let them remember, there may be "*death in the pot*." Copper is another poisonous metal. All copper and brass kitchen utensils should be used cautiously—and brass cocks ought in particular to be avoided in drawing off any acidulous liquor. Oils, too, act on copper, at least when rancid; and I have often witnessed the melted tallow on a brass candlestick colored a deep green.

Finess.—Some workmen in Italy being on the point of hurling a stone from the roof of a house, called out to the persons passing to take care. A man going by, and neglecting the caution, was wounded by the fall of a stone; and summoning the workmen into a court of law, demanded damages. Pylæus, a lawyer of much eminence in the twelfth century, was employed as counsel for the workmen; and finding that there was no possibility of procuring evidence that his clients had called out to the passers by, he advised them how to act accordingly. When the trial came on, and they were interrogated by the Judge, and asked why they had hurled down the stone so carelessly? they made no answer. The Judge repeated his question, but still they were silent. The Judge appearing astonished at this, Pylæus informed him that his clients were unhappily deaf and dumb. "Nay," exclaimed the plaintiff, "that never can be, for I heard these very men cry out to every body take care." "If so," said Pylæus, "I have proved what was necessary; no damages can be awarded, and they must be acquitted."

THE FARMER.

BOSTON:—SATURDAY, MARCH 22, 1823.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but those who pay within *sixty days* from the time of subscription will be entitled to a deduction of FIFTY CENTS.

A title-page and index will be furnished, gratis to those who take the whole volume.

Agents who procure seven subscribers, and become responsible for the payment, will be entitled to copy gratis, and in the same proportion for a larger number.

Complete files from the commencement of the paper in August can be furnished.

BREEDING OF CATTLE, &c.

We this day conclude Mr. Wilkinson's *Remarks on the Improvement of Cattle*, &c. which deserve not only to be read but to be studied, and his leading maxims impressed on the memory of every farmer who wishes to keep a good stock of cattle. We do not suppose that all his observations can be of immediate practical utility to American farmers in general, but we believe much benefit may be derived from them. The perusal of these remarks should merely induce to breed from our *best stock*, instead of slaughtering, selling the finest animals to butchers, and keeping the poorest to breed from, they will prove of very great value to American agriculture.

An error with regard to the breeding of cattle and other domestic animals has done much mischief in Great Britain, and been attended with some bad consequences in the United States. Mr. Lawrence, an English writer of eminence and general correctness, in a *Treatise on Cattle*, p. 27, says—"You may breed *FOREVER in-and-in*, or from the nearest affinities of blood, with the utmost success, provided you select, with judgment, the best shaped individuals; and the finest animals of this country have been bred in this mode." When we first read this sweeping maxim it struck us as something similar to that of the honest man, who declared that "chessnut rails would last *forever and ever*, to his certain knowledge, for he had tried the experiment *out and out*, and never knew it fail in *all his life time*." We thought that the Law of Nature was adverse to incestuous connexions, as well among brute as mankind. We consulted some scientific and practical agriculturists in this vicinity, and were informed that the best race of animals by *breeding in-and-in*, or cohabiting exclusively with their near relations, would speedily degenerate, the offspring become puny and sickly, and in time unable to breed at all. This was particularly the case with swine, as some persons had experienced to their cost. We also consulted Sir John Sinclair, whose authority we consider as pre-eminent in questions relating to improvements in agriculture; and found that he is pointedly opposed to the plan of confining the connexions of a superior breed of animals to the same family.

"This method," observes the worthy Baronet, "of breeding *in-and-in*, or putting animals of the nearest relationship together, was for some time in fashion, under the sanction of Mr. Bakewell's authority, yet experience has now proved, that it cannot be successfully persevered in. It may be beneficial, indeed, if not carried too far, in fixing any variety that may be thought valuable, but on the whole, it is only in appearance. Under this system the young animal comes into the world, on comparatively, a very small scale. By keeping it fat from the first moment of its existence, it is made to attain a greater size than nature intended; and its weight in consequence, will be very great, in proportion to the size of its bones. Thus a generation

RURAL PEACE AND INDEPENDENCE.

That man is fortunate, who timely wise,
Lives peaceful blessings can discern and prize,
Who ne'er his talents, wealth nor time employs,
In quest of costly and tumultuous joys;
Nor chauntily refuses to partake
Of God's good things, created for his sake,—
Spurning the gifts of Deity design'd
To cheer and bless the lot of human-kind—
With some good books, some good companions' best,
"Health in his vine, and quiet in his breast."
Aloof from scenes of riot, noise and strife,
Enjoys the comforts of a rural life.
Him no anxiety, no fears appal;
He ne'er submits to "low ambition's" trail,
Ne'er sends a falsehood to import,
But makes his tongue the herald of his heart—
Ne'er stoops to high, nor spurns at low degree,
His manners still from affectation free,
He never masks grim malice with a smile,
Nor masks hypocrisy the guise of guile.
Though sometimes blunt, he always is sincere,
And what he is, is willing to appear.
Though no rich labors of a foreign loom,
Nor costly paintings decorate his room,
Light, but sound slumber, softly seals his eyes,
That boon of innocence and exercise,
Which monarchs covet, but cannot enjoy,
Sweetly rewards his every day's employ.
Health tempers all his cups, and at his board
Reign the cheap luxuries his fields afford.
Seen from the cycle-hobs of his retreat,
High life appears a bubble and a cheat;
He marks the many who to ruin run,
Knave who undo, and fools who are undone,
Some by a sordid thirst of gain controld,
Stare in full stores, and cheat themelves for gold,
Others devour ambition's glittering bait,
Striving to gain the dignities of state,
Much harder, and more dirty work go through
Than farmers can be call'd upon to do;—
Beholding these, is thankful that his lot
Gives peace and freedom in a country cot.

From the New York Statesman.

CULTIVATION OF TEASELS.

As the season is approaching when the spring planting will commence, I have presumed through the medium of your excellent paper, which I observe is devoted to every subject that can subservise the interest of the agriculturist, merchant, and manufacturer, to call the attention of the former, to the growth of the cardia fullonium, or fuller's teasels.

They are employed for raising the nap on woollen cloth, and no other material can be used as a substitute. It is a biennial plant, and there is some uncertainty in obtaining a crop; but when planted in a suitable soil and properly cultivated, the chance is three to one in favor of a successful result. The crop, in England, is sometimes fourteen or more packs to the acre, and at other times scarcely any. When cut they are sorted into three different kinds—into kings, middlings, and scrubs—they are then made into packs, the kings containing nine thousand, the middlings twenty, the third or scrubs, are not considered as of any value.

The demand for teasels in this country is already considerable, and is daily increasing. Some manufacturers are now consuming more

than three hundred thousand per annum. Supposing that ten packs were the produce of an acre of land, and the market price were only twenty-five cents per hundred, the cultivator would realize from the acre four hundred and seventy-two dollars and fifty cents; deduct from this for rent, labor, &c. and it will be seen that no other crop can prove so profitable to the farmer.

"The soils most adapted to the growth of this plant, are those of the more strong and deep kinds; but which are not too rich, as loamy clays, and such as have strong marly bottoms, and are fit for the growth of wheat crops."

"The most favorable situations are those that are rather elevated, open, and inclined a little to the south, and the higher grounds, particularly where the country is inclosed, are the most advantageous."

"For the preparation of the ground, where it is a lea, it should be ploughed up deeply in the early part of the year; and where it is inclined to moisture, it should be executed in narrow ridges of not more than three bouts each."

"In providing the seed, it should be constantly taken from such plants as are the most perfect of their kind, and the most productive in heads. It should be suffered to remain till it becomes perfectly ripened, and be used while fresh."

"From one to two pecks are sufficient for an acre, some use three."

"The crop should be put in as early as the spring will permit. The common method is to broadcast, it being sown after the manner that is practised for turnips. Before sowing, the land should be well harrowed down, in order to afford a fine state of mould as a bed for the seed."

"The land should be kept clean from weeds, the plants should be hoed out so as to leave them twelve inches apart, and have them well earthed up. When the blossoms fall the plants are ripe, and in a state to be cut and secured. They should be cut with about nine inches of stem, and tied up in handfuls with some of the stems. On the evening of the day on which they are cut, they should be put in a dry shed, and should be exposed to the sun daily in clear weather, till they become perfectly dry; they should then be sorted and kept in a dry loft."

Having given an account of the manner of raising this plant in England, I shall offer some remarks on the mode of cultivating it in this country.

Those who cultivate them here, are not sufficiently attentive to the quality of the seed. Instead of taking it from fine heads, that have been permitted to ripen, they collect it promiscuously from those that have been collected for sale. As the teasel is cut for use when the blossom falls before the seed is ripe, the plants cannot be so vigorous as when taken from those heads which have been permitted to ripen.

The choosing of a genial soil, and situation, together with keeping the crop clean from weeds by good hoeing, is generally neglected by our farmers; all of which appear to be essentially necessary to insure a productive crop.

Those who cultivate them in this country, sow the seed in beds and transplant them in the fall. This system is highly objectionable, and is no doubt the principal cause of the frequent failure of the crop. The growth of the plants is checked by being transplanted, the

roots will not descend to the same depth in soil, and the winter comes on before they have recovered their pristine vigour; hence cause of the plants being destroyed either partially, or altogether during the winter season.

Last year our crop was generally destroyed and had not a supply been obtained from England, the woollen manufacturers would have been much injured. In that country the crop is usually more or less productive, but owing to the moisture of the climate, is often of little value. This was peculiarly the case with the year 1822. When the crop failed in last summer, manufacturers and merchants imported to supply the demand, but most of them were brought in, having been brought there by persons totally unacquainted with the article, the damaged teasels of the crop of 1822 were sent out, which have proved a dead loss to manufacturers who purchased them. I have seen only one lot that can be considered a prize article, and those were bought of Messrs. D. Bethune and Co.

As this country appears to be destined to become the seat of manufactures, it would well for our agriculturists to turn their attention to the raising of such crops as will supply the new demands thereby created. It would require more than sixteen thousand acres to raise all that is wanting for the present woollen establishments, and the demand will be annually increasing. Should you consider this article worthy an insertion, it may encourage me to send you other essays relative to the raising of articles now imported.

A MANUFACTURE
of Columbia Co.

The Unnatural Son.—A certain farmer in Connecticut, possessing a small estate, was persuaded by his only son, (who was married, lived with his father,) to give him a deed of property. It was accordingly executed. As the father began to find himself neglected—he removed from the common table, to a block the chimney corner, to take the morsel of reluctantly given him—at last, one day the natural son resolved to try once more to bring the heart of his sire. He procured a block began to hollow it. While at work he questioned by one of his children what he was doing. "I am making a trough for your grandfather to eat out of," was the reply. "I says the child, 'and when you are as old as grandfather, shall I have to make a trough for you to eat out of?'" The instrument being used fell from his hand—the block was cast the fire—the old man's forgiveness asked, he was restored to the situation his age and worth entitled him.

Sailing Carriages.—A machine, invented by a gentleman of Christ-College, Cambridge, lately tried at New Market. In shape it is nearly that of an isosceles triangle, and it moves with the broad end forward, on four wheels. It has a boom thirty-two feet long, and an exceeding high mast. It will carry 12 persons at the rate of thirty miles an hour. To the axle of the hinder wheels is fixed a rudder. It goes on a wind, and tack as a vessel at sea, and is capable of being so correctly guided, that a pilot at pleasure can run the wheels over a stone.—*London Mag.*

NEW ENGLAND FARMER.

PUBLISHED BY THOMAS W. SHEPARD, ROGERS' BUILDINGS, CONGRESS STREET, (FOURTH DOOR FROM STATE STREET.)

VOL. I.

BOSTON, SATURDAY, MARCH 29, 1823.

No. 35.

CATTLE SHOW,

Exhibition of Manufactures, Ploughing Match, and Public Sale of Animals and Manufactures, at Brighton, Mass. on Wednesday and Thursday, the 15th and 16th of October, 1823, to commence at 9 o'clock, A. M. on each day.

The Trustees of the Massachusetts Society for the Promotion of Agriculture, encouraged by the patronage of the Legislature of this State, intend to offer in Premiums, not only the sum granted by the Government for that purpose, but also the whole amount of the income of their own funds. They, therefore, announce to the public, their wish to have a CATTLE SHOW, and EXHIBITION OF MANUFACTURES, &c. &c. at Brighton, on Wednesday and Thursday, the 15th and 16th of October, 1823; and they offer the following PREMIUMS:

FOR STOCK.

For the best Bull, raised in Massachusetts, above one year old \$30
For the next best do. do. 20
For the next best do. do. 10
For the best Bull Calf, from 5 to 12 months old 15
For the next best do. do. 10
For the next best do. do. 5
For the best Cow, not less than three years old 30
For the next best do. do. 20
For the next best do. do. 15
For the best Heifer, from one to three years old, with or without calf 15
For the next best do. do. 10
For the next best do. do. 7
For the best Ox, fitted for slaughter, regard to be had to the mode and expense of fattening 30
For the next best do. do. 25
For the next best do. do. 15
For the best pair of Working Oxen 30
For the next best do. do. 25
For the next best do. do. 20
For the next best do. do. 15
For the next best do. do. 10
For the best pair of Spayed Heifers, not less than one year old 25
For the best Spayed Sows, not less than four in number, and not less than five months old 20

The claimant to be entitled to either of these two last premiums, must state, in writing, the mode of operation and treatment, in a manner satisfactory to the Trustees.

For the best Merino Wethers, not less than six in number, having respect to form and fleece 15
For the next best do. do. 8
For the best Native Wethers, not less than six in number do. 10
For the next best do. do. do. 5
For the best Merino Ram, do. 15
For the next best do. 10
For the best Merino Ewes, not less than five in number, do. 20
For the next best do. do. do. 10
For the best Boar, not exceeding two years old 12
For the next best do. do. 8
For the next best do. do. 5
For the best Sow 12
For the next best do. 8
For the next best do. 5
For the best Pigs, not less than two in number, nor less than four months old, nor more than eight 10
For the next best do. do. 5

None of the above animals will be entitled to premiums, unless they are wholly bred in the State of Massachusetts.

For the best Ram which shall be imported into this State, after this advertisement, and before the 15th day of October next, of the improved Leicester breed of long woolled sheep or a gold medal of that value, at the option of the importer.

For the next best do. do.

For the best Ewe of the same breed, imported under the same terms, and for the like superior qualities

For the next best do. do.

To the person who shall import into this State, from Europe, a male and female Goat, of the pure Cashmere breed

The persons claiming these premiums to engage to keep the imported animals within the State.

No animal, for which to any owner one premium shall have been awarded, shall be considered a subject for any future premium of the Society, except it be for an entirely distinct premium, and for qualities different from those for which the former premium was awarded.

Any of the above Stock, when raised and still owned at the time of the exhibition, by the person who raised them, will entitle the claimant to an allowance of ten per cent. in addition. But Sheep, to be entitled to any of the above premiums, must be raised by the person entering them.

FOR AGRICULTURAL EXPERIMENTS.

To the person who shall raise the greatest quantity of Indian Corn on an acre, not less than seventy bushels \$30

To the person who shall make the most satisfactory experiment, to ascertain the best mode of raising Indian Corn, whether in hills or rows, not less than half an acre being employed in each mode, in the same field, the quantity and quality both of land and manure to be equal and uniform in each mode; all to receive a cultivation requisite to produce a good crop

To the person who shall raise the greatest quantity of Vegetables, grain, peas and beans excepted, for winter consumption, of the stock on his own farm, and not for sale, in proportion to the size of the farm and stock kept, having regard to the respective value of said vegetables as food, stating the expense of raising the same, and the best mode of preserving the same through the winter

To the person who shall raise the greatest quantity of winter Wheat on an acre

To the person who shall raise the greatest quantity of spring Wheat on an acre

To the person who shall raise the greatest quantity of Barley on an acre, not less than forty-five bushels

To the person who shall raise the greatest crop of Millet on an acre, cut and cured for hay, the claimant giving evidence of the time of sowing, the quantity of seed sown, and the quantity of hay produced

To the person who shall raise the greatest quantity of Carrots on an acre, not less than six hundred bushels

To the person who shall raise the greatest quantity of Potatoes on an acre, not less than five hundred bushels

To the person who shall raise the greatest quantity of common Beets on an acre, not less than six hundred bushels

To the person who shall raise the greatest quantity of Parsnips on an acre, not less than four hundred bushels

To the person who shall raise the greatest quantity of Mangel Wurtzel on an acre, not less than six hundred bushels

To the person who shall raise the greatest quantity of Ruta Baga on an acre, not less than six hundred bushels 20

75 To the person who shall raise the greatest quantity of Turnips on an acre, not less than six hundred bushels 20

50 To the person who shall raise the greatest quantity of common Turnips, after any other crop in the same season, being not less than four hundred and fifty bushels 20

60 To the person who shall raise the greatest quantity of Onions on an acre, not less than six hundred bushels 20

100 To the person who shall raise the greatest quantity of Cabbages on an acre, not less than 25 tons weight, free from earth when weighed 20

To the person who shall give satisfactory evidence on 'Soiling Cattle,' not less than six in number, and through the whole season, together with a particular account of the food given, and how cultivated 5

To the person who shall make the experiment of turning in green crops as a manure, on a tract not less than one acre, and prove its utility and cheapness, giving a particular account of the process and its result 20

To the person who shall, by actual experiment, prove the best season and modes of laying down lands to grass, whether spring, summer or fall seeding be preferable, and with or without grain on different soils 30

To the person who shall raise the greatest quantity of dry Peas on an acre, not less than thirty bushels 20

To the person who shall raise the greatest quantity of dry Beans on an acre, not less than thirty bushels 20

To the person who shall give proof of having produced the largest quantity of dressed Flax, raised on half an acre, not less than two hundred and fifty pounds 20

To the person who shall take up in the season, on his own farm, the greatest quantity of good Honey, which shall at the same time exhibit superior skill in the management of Bees 10

20 For the best Cheese, not less than one year old, and not less in quantity than one hundred pounds 10
For the next best do. do. 5

For the best Cheese less than one year old 10
For the next best do. do. 5

To the person who shall prove to the satisfaction of the Trustees, that his mode of rearing, feeding and fattening neat cattle is best 20

For the best Butter, not less than fifty pounds 10
For the next best do. do. 10

For the next best do. do. 7
For the next best do. do. 5

For the greatest quantity of Butter and Cheese, made between the 15th of May, and the 1st of October, from not less than four Cows, the quality of the Butter and Cheese, and the number of Cows to be taken into consideration, and specimens to be exhibited at the Show, of not less than twenty pounds of each, and the mode of feeding, if any thing besides pasture was used 20

To the person who shall prove by satisfactory experiments, to the satisfaction of the Trustees, the utility and comparative value of the cobs of Indian Corn, when used with or without the grain itself, ground or broken 20

For the best specimen of Cider, not less than one barrel, made in 1822, manufactured by the person who shall exhibit the same, and from apples grown on his own farm 20

For the second best barrel 10

[These premiums will be continued in future years. Persons claiming them must state, in writing, their process of making and managing their Cider, and the kind of apples used.]

For the best specimen of Currant Wine, not less than one gallon, exhibited by any person who 20

shall have made not less than 30 gallons in the same season in which that which shall be exhibited was made, (a statement to be given, in writing, of the process of making the same) 10
For the next best do. do. 5

To entitle himself to either of the Premiums for Grain or Vegetable crops, the person claiming, must cultivate a tract of at least one acre in one piece, with the plant or production for which he claims a premium, and must state, in writing, under oath of the owner, and of one other person, (accompanied by a certificate of the measurement of the land by some sworn surveyor,) the following particulars:

1. The state and quality of the land, in the spring of 1823.
2. The product and general state of cultivation and quantity of manure employed on it the year preceding.
3. The quantity of manure used the present season.
4. The quantity of seed used, and if Potatoes, the sort.
5. The time and manner of sowing, weeding, and harvesting the crop, and the amount of the product, ascertained by actual measurement, after the whole produce for which a premium is claimed, is harvested, and the entire expense of cultivation.

And in relation to all vegetables, except Potatoes, Onions, and common Turnips, the fair average weight of at least twenty bushels must be attested; and if there be hay scales in the town in which raised, not less than three average cart loads must be weighed.

The claim under this head, together with the evidences of the actual product, must be delivered, free of expense, to Benjamin Guild, Esq. in Boston, Assistant Recording Secretary of this Society, on or before the first day of December next—the Trustees not intending to decide upon claims under the head of Agricultural Experiments, until their meeting in December.

FOR INVENTIONS.

To the person who shall use the Drill Plough, or Machine, and apply it most successfully to the cultivation of any small Grains or Seeds, on a scale not less than one acre \$20
To the person who shall invent the best Machine for pulverizing and grinding Plaster to the fineness of twenty-five bushels per ton, and which shall require no more power than a pair of oxen or horse, to turn out two tons per day, and so portable that it can be removed from one farm to another without inconvenience 30
To the person who shall produce, at the Show, any other Agricultural Implement, of his own invention, which shall, in the opinion of the Trustees, deserve a reward, a premium not exceeding twenty dollars, according to the value of the article exhibited 20

In all cases proofs must be given of the work done by the Machine, before it is exhibited; and of its having been used and approved by some practical farmer. Persons who have taken out Patents for their inventions, are not thereby excluded from claiming any of the above premiums.

FOR FOREST TREES.

For the best plantation of White Oak Trees, not less than one acre, nor fewer than one thousand trees per acre, to be raised from the acorn, and which trees shall be in the best thriving state, on the first of September, 1823 \$100
For the best plantation of White Ash, and of Larch Trees, each of not less than one acre, nor fewer than one thousand trees per acre, to be raised

from the seeds, and which trees shall be in the best thriving state, on the first of Sept. 1823.

For the best Live Hedge made of either the White or Cockspur Thorn, planted in 1820, not less than one hundred rods, and which shall be in the best state in 1823

To the person who shall have planted out on his farm, since the spring of 1815, the greatest number of Apple Trees, not less than one hundred in number, and who shall exhibit to the Trustees, at the Show in 1827, satisfactory evidence of his having managed them with care and skill

FOR DOMESTIC MANUFACTURES.

To the person or corporation who shall produce the best specimen of fine Broadcloth, not less than 1-5-8 yards wide, exclusive of the list, forty yards in quantity, and dyed in the wool \$20
For the second best do. do. do. 15

For the best superfine Cassimere, not less than 3-4 yard wide, nor less than forty yards in quantity 12
For the second best do. do. do. 8

For the best superfine Sattinet, 3-4 yd. wide, not less than 50 yards 3
For the second best do. do. do. 5

For the best Sole Leather, not less than five sides 5
For the second best do. do. do. 10

For the best dressed Calve Skins, not less than twelve in number 10
For the second best do. do. do. 5

FOR HOUSEHOLD MANUFACTURES.

For the best Woollen Cloth, 3-4 yard wide, not less than twenty yards in quantity \$12
For the second best do. do. 8

For the best double milled Kersey, 3-4 yard wide, not less than twenty yards in quantity 12
For the second best do. do. 8

For the best Coating, 3-4 yd. wide, not less than 20 yards in quantity 8
For the second best do. do. 6

For the best Flannel, 7-8 yd. wide, not less than 45 yds. in quantity 10
For the second best do. do. 7

For the best yard wide Carpeting, not less than 30 yards in quantity 15
For the second best do. do. 7

For the best 5-8 yard wide Stair Carpeting, not less than 30 yards in quantity 10
For the next best do. do. 7

For the best pair of Blankets, not less than 8-4 wide and 10-4 long 6
For the second best do. do. 4

For the best Woollen Kait Hose, not less than 12 pair in number 5
For the second best do. do. 3

For the best Worsted Hose, not less than 12 pair in number 5
For the second best do. do. 3

For the best Men's Half Hose, (woollen) not less than 12 pair in number 4
For the second best do. do. 2

For the best Men's Woollen Gloves, not less than 12 pair in number 5
For the second best do. do. 3

For the best Linen Diaper, 5-8 yard wide, not less than 30 yards in quantity 5
For the second best do. do. 3

For the best yard wide Diaper, (for table linen) not less than 30 yards in quantity 10
For the second best 5

For the best specimen of Sewing Silk, raised and spun in this State, of good fast colors, not less than one pound 5
For the second best do. do. 3

For the best Linen Cloth (for shirting or sheeting) one yard wide, and twenty-five yards long 8
For the second best do. do. 4

To the person who shall produce the best specimen of any Cotton fabrics in private families, not less than five pieces 20

All the above Manufactures, (except when of Cotton) must be of the growth and manufacture of the State of Massachusetts. And all Manufactures, when presented, must have a private mark, and any public or known mark must be completely concealed, so as not to be seen, or known by the Committee, nor must the Propri-

etors be present when they are examined; in default of either of these requisitions, the articles will not be deemed entitled to consideration or premium.

Animals, Manufactures, or Articles, may be offered for premium at Brighton, notwithstanding they may have received a premium from a County Agricultural Society.

It is understood, that whenever merely from a want of competition, any of the claimants may be considered entitled to the premium, under a literal construction, yet if, in the opinion of the Judges, the object so offered is not deserving of any reward, the Judges shall have a right to reject such claims. Persons to whom premiums shall be awarded, may, at their option, have an article of Plate, with suitable inscriptions, in lieu of money. Premiums will be paid within ten days after they shall be awarded.

That in any case in which a pecuniary premium is offered, the Trustees may, having regard to the circumstances of the Competitor, award either one of the Society's gold or silver medals in lieu of the pecuniary premium annexed to the several articles.

That if any competitor for any of the Society's premiums shall be discovered to have used any disingenuous measures, by which the objects of the society have been defeated, such person shall not only forfeit the premium which may have been awarded to him, but be rendered incapable of being ever after a competitor for any of the Society's premiums.

All premiums not demanded within six months after they shall have been awarded, shall be deemed as having been generously given to aid the funds of the Society.

PLOUGHING MATCH.

On the second day of the Cattle Show, viz. the 16th day of October, Premiums will be given to the owners and ploughmen of the three Ploughs, drawn by two yoke of oxen, and to the three Ploughs drawn by one yoke of oxen, which shall be adjudged, by a competent Committee, to have performed the best work, with least expense of labor, not exceeding half an acre to each plough. Notice will be given in the public Papers, at least six weeks before said day, that a piece of ground has been provided for twenty ploughs—ten double and ten single teams; and that entries may be made of the names of the competitors until the morning of the 16th. Preference will be given to those who enter first; but if, on calling the list at the hour appointed, precisely, those first named do not appear, the next in order will be preferred. There will be two Committees, of three persons each—one to be the judges of the ploughing by the double teams, the other of the ploughing by the single teams—the latter to have assigned to them a part of the field distinct from that of the double teams.

Premiums as follows, (being the same for the double and single teams.)

First Plough	\$15	Second Plough	\$10	Third Plough	\$6
Ploughman	3	Ploughman	5	Ploughman	3
Driver	4	Driver	3	Driver	2

In each case, if there be no Driver, both sums to be awarded to the Ploughman.

The persons intending to contend for these Prizes, must give notice, in writing, to S. W. POMEROY, or GORHAM PARSONS, Esqrs. of Brighton. The competitors will also be considered as agreeing to follow such rules and regulations

may be adopted by the Committee, on the subject. The ploughs to be ready to start at 9 o'clock, A. M.

The result of the last Ploughing Matches at Brighton, and the satisfaction expressed by so many of their agricultural brethren, will induce the Society to continue these premiums annually, in connexion with the Cattle Show, as an efficacious means for exciting emulation and improvement in the use and construction of the most important instrument of agriculture.

Persons intending to offer any species of stock for premiums, are requested to give notice thereof, either by letter (post paid) stating the article, or to make personal application to Mr. JONATHAN WISSHIP, at Brighton, on or before the 14th day of October, and requesting him to enter such notice or application, so that tickets may be ready at 9 o'clock on the 15th. No person will be considered as a competitor, who shall not have given such notice, or made such application for entry, on or before the time above specified.

All articles of manufactures and inventions, must be entered and deposited in the Society's rooms, on Monday the 13th of October, and will be examined by the Committees on Tuesday, the 14th, the day before the Cattle Show; and no person but the Trustees shall be admitted to examine them before the Show. The articles exhibited, must be left till after the Show, to the satisfaction of the public.

The applicants will be held to a rigid compliance with this rule relative to entries, as well as to the other rules prescribed.

The examination of every species of stock, except working oxen) will take place on the 14th; and the trial of Working Oxen, and Ploughing Match, on the 16th of October.

The Trustees also propose to appropriate, the second day of the Cattle Show, their rooms for the public sale of any Animals, that have been offered for premium, and also of any others, that are considered by them, as possessing fine qualities; and their Halls for the public sale of Manufactures. Both sales to take place at half past eleven o'clock, precisely. And for all Animals or Manufactures, that are intended to be sold, notice must be given to the Secretary, before ten o'clock of the 16th. Auctioneers will be provided by the Trustees.

By order of the Trustees,

R. SULLIVAN,
J. PRINCE,
G. PARSONS, } Committee.
E. H. DERBY, }

January, 1823.

ORIGINAL COMMUNICATIONS.

FOR THE NEW ENGLAND FARMER.

TO PRESERVE BACON AT ALL SEASONS AND IN ALL PLACES.

MR. EDITOR—You have published in your valuable "New England Farmer," several methods for preserving smoked meats. It seems to me of them have perfectly well answered the purpose; and the numerous methods prescribed give the evidence that none of them have succeeded satisfactorily. Much experience has enabled me to offer you a prescription on the subject that never has and never will fail of answering the purpose, viz. preserving those meats from the ravages of all small animals, and preserving them sound for any length of time, and in any

climate. It is the use of CHARCOAL. The nature of this material is well understood by Chemists, and its properties and effects fully explained. My mode of putting down any kind of smoked meats, is thus: Take a tierce or box and cover the bottom with charcoal, reduced to small pieces, but not to dust; cover the legs or pieces of meat with stout brown paper, sewed around so as to exclude all dust; lay them down on the coal in compact order, then cover the layer with coal, and so on until your business is done, and cover the top with a good thickness of coal.

The use of charcoal, properly prepared in boxes, is of great benefit in preserving fresh provisions, butter and fruits, in warm weather; also in recovering meats of any kind, when partially damaged, by covering the same a few hours in the coal. Let those whose situation requires it, make the experiment on any article of food subject to decay, and they will more than realize their expectations.

SPRING WHEAT, AND THE BEST PREVENTIVE AGAINST SMUT.

This is a most valuable crop, and may be raised on almost any soil and in every part of the Commonwealth, free of smut. The numerous failures in this crop arise chiefly from bad or unskilful management. I have raised this kind of wheat for the last thirty years, and have never failed of having a good crop, and often very productive. My method is thus: If I propose to sow wheat on sward land, I cause it to be broken up during the preceding autumn—early in the spring as the season will allow. I harrow the land thoroughly and cross plough it. I then usually cart out proper manure, and spread it from the cart over the whole surface, in quantity as the soil may demand. I then immediately sow on the wheat, and plough it in shallow. If the land is to be laid down for grass, sow the seed immediately after the wheat and plough it in, or immediately after the wheat is ploughed in, as you please, and harrow down the whole thoroughly; first with the furrows and then across the furrows—after four or five days pass a roller over the land and lay it smooth. It is all important to have this operation commenced and finished as early in the spring as possible. But the most essential part of the process is to prepare the Wheat for sowing. The only successful course is, to prepare the seed about ten days before sowing time. This is done by selecting clean and plump seed, passing it through water in a tub, about half a bushel at a time, and washing it and skimming off all matter that floats, then empty it into a basket to drain, then lay it on a clean floor and rake in two quarts of slacked lime and one quart of plaister to the bushel, and if too dry sprinkle on water and continue to stir it until all is covered with the lime and plaister. In this way you may proceed until you have prepared your whole seed. Let it remain in a heap one day, then spread it, and move it daily, until it becomes perfectly dry; it is then fit to sow, and you may sow it if the land should happen to be quite wet. The quantity of Wheat to an acre should be one bushel and twenty quarts. In the process of sowing you may not be able to apportion your seed exactly to the acre; therefore when you have sowed and ploughed in the quantity proposed for the acre, you may gather all that remains with the lime and plaister, and sow it on to the whole piece of land, passing

across the furrows. This will make it even, and cause a very equal distribution of the seed, which may then be harrowed. After the Wheat has come up three or four inches above the ground, sow on one bushel of plaister to the acre, or house ashes equivalent, as you please, or leached ashes, increasing the quantity. When the Wheat begins to head, examine it, and if you find cockle, rye, oats, &c. mixed and growing, take care carefully to weed out all, so as to leave the field clean and of pure Wheat. At harvest, cut it a little before the kernel becomes hard, and set it up in the field in small stacks to cure, and remove it under cover after it is dry, and the kernel hard. This process will give you more and better flour than if managed in any other way. BERSHIRE

FOR THE NEW ENGLAND FARMER.

MR. EDITOR—In your paper of the 15th inst. page 258, you wish to be informed what sort of land I raised my turnips on by ploughing in the dews. It was a coarse gravelly loam. The first time I ploughed it as deep as I could with one furrow, I should think 10 inches. Afterwards, I meant to plough about six inches. My reason for ploughing deep the first time, was to open and lighten the earth, so that its vapors may arise, and unite with the dampness of the dew in the night air. In a cool morning in the summer, the earth being hotter than the air, sends up its moist vapors from below; and the earth being loose by deep ploughing, the moisture ascends easier, and drought does not affect the land so much as after ploughing not so deep. The dew which is taken up contains a quantity of rich salts, which, when ploughed in and turned under the furrow, the richest part is retained under and in the furrow, when the moisture is again exhaled by the heat of the sun. My reasoning on the subject is this. In running cider through sand, you lose all the best spirit, which is left in the sand; and although it may dry through the furrow, when suitable weather comes, yet the food for plants will remain. All sorts of manure create moisture and retain dew. Plaister, and all kinds of stone, pulverized and sown on the land, collect the dew and retain it longer in the morning before it is taken up, and give time to plough later in the morning, and save the richness of the dew. Ashes, burnt clay, frozen clay, all have a tendency to retain dew; and many more things may perhaps be discovered yet unknown.

Yours, &c.

WALLIS LITTLE

Townsend, March 21, 1823.

Mr. Jabez Rowe of Sandy Bay, Gloucester, and Mr. Hall of this city, have invented a new method of manufacturing Isinglass of superior quality from *hake sounds*. The inventors have in operation, an extensive manufacturing establishment at the first mentioned place, and the Isinglass received from this manufactory is preferred by Boston and New York brewers, to that imported from Russia.

Seasoning Glass.—Place the glass in a vessel of cold water, and heat the water gradually till it boils. Glasses of every description, thus prepared, will afterwards bear boiling water poured on them without injury.

HAMPSHIRE, FRANKLIN, AND HAMPELEN AGRICULTURAL SOCIETY.

The Executive Committee of the Hampshire, Franklin, and Hampden Agricultural Society have awarded the following premiums for agricultural experiments made during the last season—

To Charles Starkweather, Esq. of Northampton, the society's first premium for the greatest quantity of corn raised on an acre, being ninety-two bushels; measured Nov. 7, 1822—\$15.00.

To the Rev. Doct. Lyman, of Hatfield, the second premium for the next greatest quantity raised on an acre, eighty-two bushels and one pint; measured Feb. 10, 1823—\$12.00.

To Joseph Lyman Partridge, of Hatfield, the 3d premium for the next greatest quantity raised on an acre, seventy-five bushels; measured Feb. 10, 1823—\$10.00.

To Samuel Buffinton, Esq. of Worthington, the society's first premium for the greatest quantity of flax and flax seed raised on an acre and twenty-seven rods;—seventeen bushels and 12 quarts of seed, and four hundred and eighty-nine pounds of flax, dressed clean—\$10.00.

The mode of culture is stated as follows:

Mr. Starkweather states that his land was in the furrow in the spring of 1821; it had been turned up the autumn before. It had been for several years down to grass; it was harrowed with a common seed harrow, and planted in drills three feet apart; about eight or nine loads of common yard manure were put in the drills; the crop that year was fifty-eight bushels. In the spring of 1822, the stalks were cut, and burnt on the ground; nineteen loads of manure were then spread over it, and harrowed down smooth; it was then planted three feet wide, and two and a half apart, and eight loads of manure put in the hills; three ears of the largest yellow corn, were put in each hill. The land was low and subject to inundation, and was not planted until the last of May.

The Rev. Doct. Lyman states that his land was planted early in May, and the seed generally failed of sprouting, and was planted a second time near the last of May; many hills of the first planting entirely failed, and others partially; part of the field was materially injured by a late frost. The manner of planting was, that one half was planted in rows of the common width, and about a yard or two and a half feet between the hills; in the other half, the hills were about the common distance of planting; each hill was manured in the hole; the quantity of manure about eight common wagon loads; after the first hoeing each hill received a sprinkling of unleached ashes; the whole number of bushels was about six. The part of the field which was most closely planted was once suckered, and the suckers given to the cows; it was a rich soiling of two cows for about half the season, and afforded a three fold compensation for all the labor attending the process. At harvest the difference of the produce from the two parts of the field was inconsiderable. The portion which was not suckered, had a slight advantage; but the profit on the whole was greatly in favor of suckering on account of the ample, and rich feed, it afforded to two cows for many weeks. The land for many preceding years was improved about one half in mowing, and the other part in pasturing. In the autumn of 1821, the turf was turned with

the plough; in the spring following, it was effectually levelled with a seed harrow. The field was cultivated faithfully with the corn harrow and hoe; it was harrowed three times, and hoed four times. If there was any difference in the product of land which had been in pasture, or that which was mowed, the decision by the eye was in favor of that which had been mowed. Dr. Lyman further states that by long experience he is convinced, that unleached ashes are the best manure for corn, to be applied after the first hoeing, at the rate of from five to ten bushels the acre; he believes that they are indispensable for securing a good crop on land turned up from the sward, in order to prevent the ravages of worms. Like experience, has also convinced him, that the second year after turning up the sward, is by far the best for ensuring a large harvest of Indian corn; it sprouts better, it ripens sooner, and is more heavily loaded with fruitful ears. The corn which Doct. Lyman planted, was the twelve rowed corn—very large ears, the kernels closely compacted, and remarkably filled to the end of the cob; and when shelled a bushel weighed sixty-four and three quarters pounds—which exceeds the weight of common eight rowed corn nearly two pounds per bushel.

Major Buffinton states, that the land on which his flax was raised, was pasture land, broken up in the spring of 1821, and planted that year with potatoes; about sixteen loads of coarse barn yard manure were put in the hills; the potatoes were hoed twice and the land was not ploughed after the crop was harvested. There was no manure put on the ground last spring; it was ploughed twice and sowed the 2d day of May, with one bushel and twelve quarts of seed. The flax was pulled the 12th and 13th of August.

JOSEPH LYMAN, *President*.

PENNSYLVANIA AGRICULTURAL SOCIETY.

At the first Quarterly Meeting, held at Norristown, on the 11th of January, 1823, the following Resolutions were unanimously adopted:

That the President be authorized to petition the Legislature, for an Act of incorporation for this Society, and for such a modification of the Act, entitled an "Act for the promotion of Agriculture, &c." as shall authorize its officers to receive from the Commissioners of

Counties Dollars, and to perform their duties as effectively, as if the Pennsylvania Agricultural Society had been organized, in conformity with the sections of said Law—and that he shall endeavor to obtain some provision by which the sale of *Spirituous Liquors shall be effectually prevented within the distance of three miles from the place at which the Agricultural Exhibitions shall be held, except at houses licensed according to law.*

That as this is an Association of practical Farmers, disposed to acquire and communicate information derived from *essays on the soil*, it shall be the duty of one of the Assistant Secretaries, to record the substance of all verbal communications, which any of the members shall make, at the quarterly meetings.

That a committee be appointed to report upon Mr. Pope's Thrashing Machine, which has been this day exhibited. Whereupon Job Roberts, John Hare Powell, and Henry L. Waddell were appointed.

That the Directors be instructed to give notice, in such manner as they shall think fit, of the intention of this Society, to award premiums, at their Annual Meeting, for Neat Cattle, Sheep, Horses, Swine, Crops, Implements of Husbandry, and Household Manufactures—the value of the prizes, to be determined at the next Quarterly meeting. Accordingly, William Harris of Chester county, George Sheaff of Montgomery county, Henry L. Waddell of Bucks county, Aaron Clement of Philadelphia county, and Thomas Serrill of Delaware county, were constituted a Committee from the Board of Directors—Job Roberts, Manual Eyre, Samuel West, and Charles Downing were subsequently appointed to aid them.

The Committee appointed to examine Mr. Pope's Thrashing machine, reported—

"After having carefully examined the construction, and observed the performance of Mr. Pope's Hand Thrashing machine, we are disposed to think, that it is well adapted to all purposes of small farms; as it has in our presence, thrashed Wheat without difficulty, at the rate of sixty sheaves an hour."

JOB ROBERTS,

JOHN HARE POWELL,

HENRY L. WADDELL.

Mr. Joseph Kersey of Chester County, made a communication on an ingenious mode of making Thrashing flails—a communication on Sheep accompanied by observations, on the expulsion of Rats.

Mr. Job Roberts of Montgomery county, communicated the result of his experience, corroborative of Mr. Kersey's remarks.

Mr. Powell of Philadelphia county, made the following communications on Mangel Wurtzel and Millet:—

I have certificates, accompanied by the oath of my farmer and his assistant, showing that 932½ bushels of Mangel Wurtzel were produced on 155¼ perches of land, which had not received more manure than is usually given to pot crops in this county. The soil had been very deeply ploughed, and stirred by Beaton's Scarifier, the manure was after ploughed nine inches under the surface, the Scarifier having been again applied, the roller and harrow were used to reduce the tilth. In April, the seeds were dibbled an inch deep—three inches apart, rows thirty inches asunder. Soon after the plants appeared, they were thinned, and left intervals of six inches—when their leaves became two inches long, they were cleaned with a four inch triangular hoe. The earth and weeds were thrown from them, by a very small one horse plough, leaving a space of four to five inches unbroken next to them. The furrow was returned by Davis' shovel plough; it was again hoed, and left a foot apart. In the first week of November, they were drawn closely cut beneath the crowns, measured, piled in a cellar in rows, as wood, and covered with sand. The expense of planting, tilling, and gathering the crop, was about equal to that of Indian corn.

My neat cattle prefer Mangel Wurtzel to roots which I have offered to them. I have found its effects, in producing large secretions of good milk, very great. I selected in November, two heifers of the same breed, and very nearly of the same age, and in similar condition; they were tied in adjoining stalls, and

been fed regularly three times a day, by the same man. One of them has had three bushels of Mangel Wurtzel, and four quarts of meal daily; the other, four and a half bushels of Mangel Wurtzel. The last, which has Mangel Wurtzel alone, is in the condition of good beef, the other is not more than what others call half fat.

I am aware that repeated experiments on various animals, must be made, to sanction any general conclusion, as to the comparative effects of different sorts of food. I mention the trial on the heifers, but as one of a series of attempts which I shall make, to determine, whether the great German Beet can be as effectively applied to the formation of fat, as to the production of milk, and the enlargement of size.

Thirty perches of this field produced more crops, than nearly two acres which were differently managed at the same time. Much depends upon the kind of seed—upon the great thoroughness of ploughing, and fineness of the tilth—not less is dependant upon the quantity of natural manure. Among the various practices which we have been seduced, by the plausible theories of the advocates of British husbandry, there is none which appears more absurd, than that which has led us to the plough, or dibble, our crops on ridges. The English farmer wisely contends with the evils produced too much rain—the American husbandman would as anxiously guard against his most formidable enemy, drought. I am inclined to think that there is no crop, cultivated in this State, which ought not to be put upon a flat surface.

In citing the experiment upon feeding with Mangel Wurtzel, I have no intention to convey any idea so preposterous as some of the "Fanciers" have conceived, that Mangel Wurtzel, or any of the fashionable roots of the day, should interfere with the king of vegetables, Indian Corn; or that where land is cheap, and labor scarce, a farmer is "wise to amuse himself," and feed his bullocks by plucking the luxuriant leaves of "the majestic Beta Altissima." I would merely recommend its cultivation, to a limited extent, on all farms. Its influence upon the cattle, milch cows, and more especially on calves, during their first winter, is very important. I have attended, with great accuracy to the ills which are brought upon most young quadrupeds, when first weaned; and have invariably found them materially diminished by the use of succulent roots.

The application of Mangel Wurtzel as food for sheep, is not the least important of its uses. Every year usually at the season when grass cannot be supplied. The health of themselves, and the thrift of their lambs, essentially depend upon succulent food being had. I am inclined to think, that no small portion of the success which English breeders have met, is to be ascribed to the large stores of roots, which they always have at command. It cannot be denied that Indian meal will, of itself, in most cases, produce extraordinary fatness, as well as great size—but I have been led to believe, that seasons are early engendered by this species of feeding, which is always expensive, and too often eventually destroys the animal, which has been thus reared.

I was induced to cultivate this vegetable, by the success of Mr. Isaac C. Jones, who I may

venture to assert, after the most diligent inquiry, is the only person, by whom it had been grown in this state, except in small patches or gardens, until within two years.

I am, &c. yours.

JOHN HARE POWELL.

JONATHAN ROBERTS, Esq.

President of Penn. Agricultural Society.

I have made many experiments on various soils, and at different seasons, to ascertain the product, as well as the properties of Millet. Upon light land, in good condition, it succeeds best. It requires in all cases, fine tilth, and as much strength of soil as is necessary to produce heavy oats. I have not seen, either in Europe or America, any green crop, which so largely rewards accurate tillage and plentiful supplies of manure, as the species of millet usually grown in this and the adjacent counties. I have sown it from the first of May, to the 20th of June, and have invariably obtained more fodder than could have been had from any grass under similar circumstances. In the autumn, eighty bushels of caustic lime per acre, were strewn upon an old sward, which was immediately ploughed, closely harrowed, sown with rye, and rolled—the rye was depastured in the winter and succeeding spring—early in April the land was ploughed again; the lime and decomposed vegetable matter was thus returned to the surface—about three weeks after it was harrowed, to destroy weeds; early in May it was again harrowed for the same purpose—within a fortnight it was stirred with Beaton's Scarifier, to the depth of nine inches, harrowed, sown with Millet, and rolled. The crop was fairly estimated at three tons per acre. After the millet was cut, the field was stirred, and repeatedly harrowed, to destroy the after growth of noxious plants. I intend to again sow rye, not only to obtain pasturage, but to protect the soil from the exhalations of the sun. In the succeeding spring, a slight dressing of fresh manure was ploughed under; the scarifier, roller, and harrow were used at intervals as before. On the 5th of May, five bushels of millet seeds were sown on four acres—on the 5th of July the crop was hauled, and estimated at four tons per acre. I have obtained this season, forty tons from sixteen acres, of which four only had been manured, the remainder could not have borne a good wheat crop. One of the loads was weighed; an account of them was regularly kept; their size was made as nearly equal as possible. I have generally used a large quantity of seed, as not more than two-thirds of that which is usually sown, will vegetate. Whilst my oxen consumed millet in its green state, they performed their work with more spirit and vigor than they had done before, or have shewn since, except when fed with grain. My cattle, of all ages, prefer it to both red, and the best white clover, meadow or timothy hay.

I am not disposed to cultivate it as a farinaceous crop, since I have found great difficulty in protecting it from the ravages of immense flocks of birds, which it attracts, and in securing it sufficiently early to prevent a large part of the grain from being left on the ground. The seeds on the upper parts of the stalks, generally ripen, and fall, before those below have been filled. I therefore invariably cut it, when the upper parts of most of the heads contain

seeds, which are hard. All my observations have confirmed me in the belief, that in this stage it affords fodder, more nutritious, and more easily made, than any sort of hay. The expense of tilling the land, in the accurate manner which I have detailed, is not so great as at first view would appear. A yoke of good oxen can scarify three acres and an half, without difficulty, in one day. I would recommend millet, not merely for its value as a food, but for the means it affords of making clean the land, without summer fallows, or drill crops. The ingenious arguments which have been adduced to prove, that deep stirring between growing crops is advantageous to them and the soil, are founded upon English experience, properly directed by close attention to the effects of a moist climate. Some of our writers have profoundly asserted, that as "dew drops" are found on the under leaves of plants after deep stirring has been given in a time of great drought, the practice is sound. I should suggest, if I were allowed, that moisture had better be at such times, conveyed to the roots, than be exhaled by the sun, or placed on the leaves until his rays shall have exhausted it all. The valuable parts of most manures, readily assume the gaseous form—every deep stirring, to a certain extent, in hot weather, therefore, impoverishes the soil. Deep ploughing, at proper seasons, is, I conceive, the basis of all good farming; such crops as shall enable the husbandman to extirpate weeds, and obtain large supplies of fodder, without much exhaustion, should be the great objects for his aim. I would propose that a foul sward receive its proper quantity of quick lime, which should be spread, and ploughed under, in its caustic state, in the early part of September; that the field be harrowed sufficiently; sown with rye at the rate of two bushels per acre, as early as possible—that it be depastured late in the autumn, and early in the spring—that in May, it be again ploughed three inches deeper than before—that it be harrowed, and left until the small weeds begin to appear—early in June, Millet should be sown—in August, the crop can be removed after the labors of the general harvest. The field should be slightly stirred with the scarifier, occasionally harrowed, and left throughout September, for the destruction of weeds as before. In October it may be manured, and sown with wheat, or left for a crop of Indian Corn.

I am, &c. yours,

JOHN HARE POWELL.

JONATHAN ROBERTS, Esq.

President of Penn. Agricultural Society.

Dr. Taylor's easy method of ascertaining the qualities of Marle, Lime Stones, or Quick Lime, for the purposes of Agriculture.

This was a communication by Dr. Taylor, to the Manchester [Eng.] Agricultural Society; the general use of marle and lime, as manures, having prompted him to point out the importance of an easy and certain method of determining the qualities of different earths and stones, and ascertaining the quantity of calcareous earth in their composition; their value, in agriculture, commonly increasing in proportion to the greater quantity of it which they contain. The process recommended is thus described: The marle or stone being dried, and reduced to powder, put half an ounce of it into a half

put glass, pouring in clear water till the glass is half full; then gradually add a small quantity of strong marine acid, commonly called spirit of salt, and stir the mixture well together. As soon as the effervescence thus excited subsides, add a little more marine acid; thus continuing the operation while any of the earthy matter appears to dissolve; and till the liquor, after being well stirred and allowed to stand for half an hour, appears sensibly acid to the taste. When the mixture has subsided, if the liquor above it be colorless, that marble or lime stone is the best which leaves the least in quantity of sediment or deposit at the bottom of the glass. This experiment is sufficient to determine which of the samples tried is most proper for the uses of agriculture; as pure calcareous earth or lime, which is the earth useful in agriculture, will be entirely dissolved, but clay or sand will not be sensibly acted on by the acid. Where great accuracy is required in determining the experiment, lay a soft spongy paper, of which the weight is exactly taken, in an earthen colander—for no metallic vessel, or implement for stirring, &c. must be used in any part of the process—and, pouring the saturated mixture of earth and acid on it, let all the liquor filter through; then pour a little clear water over the earthy matter remaining on the filter; and, when that water has also filtered through, dry the paper with the earthy matter on it which remains undissolved, when the deficiency found, on weighing them, from their original weight, will discover what portion of the marble or lime has been dissolved in the acid. What quantity of earthy matter has been dissolved, may be made evident to the sight, by gradually adding to the liquor which has been filtered through the paper, a clear solution of pearl ashes, or ashes of burnt wood; this will occasion a precipitation of the contained lime or calcareous earth to the bottom of the vessel, which precipitate must be dried and weighed.

THE FARMER.

BOSTON:—SATURDAY, MARCH 29, 1823.

The Farmer's and Gardener's Remembrancer.

MARCH AND APRIL.

SOWING GRASS LAND.—Those cultivators who propose to lay down land to grass, and have not sowed their grass seed with their winter grain should sow it about this time. Some say that grass seed cannot be sowed too early in the spring, and others advise to wait till the ground becomes a little warmed and dried by the sun. Should you think it advisable to spring-harrow your winter grain, which is a practice highly recommended by British and American agriculturists, you can at the same time, harrow in your grass seed. If not, sow it without harrowing in damp calm weather.

ACCIDENTAL MANURE.—As soon as the ground is bare of snow in the spring, turn out with your boys, and parade over your pasture land, (and your mowing lots if you ever permit cattle to feed on them, which by the bye is not a good practice) and with bats or long handled mallets beat and spread about the droppings of your cattle.

TOP DRESSINGS.—If you neglected to manure your mowing land with top-dressings last fall, it may be done in the spring; though it is generally held that manure is applied to grass land

to the best advantage in autumn.* Dr. Deane observed, "If the application of top dressings to mowing ground were generally practiced, and repeated as it ought to be, instead of the general, or rather universal neglect of it, it would put a new face upon things. A vast plenty of hay, double crops, two cuttings in a year, and much increase of wealth to farmers in general would be the happy consequences."† Sir John Sinclair recommends top dressing a growing crop, when it is suspected that the land is not rich enough to bring a full crop to perfection, and directs that this should be done as early in the spring as the land becomes sufficiently dry to bear the treading of a horse without poaching; and after the manure has been applied, the land should generally be harrowed or rolled. Soot, ashes, and other light manures are thus most advantageously disposed of.‡

A few bushels of lime, thoroughly pulverized and air slacked, are recommended as top dressings for winter grain. Ashes too, either leached or dry, make a good top dressing for grass or grain, as well as for Indian corn. Dry unleached ashes are best, but leached ashes are valuable, particularly soap's waste, which has lime mixed with it.

SPRING PLOUGHING.—A prudent farmer will manage his affairs in such a way as to have as little ploughing to perform in the spring as possible. In general way it is thought that all the land which it is intended to sow with any kind of grain, in the spring, or to plant with potatoes, or Indian corn, &c. should, by all means, be ploughed the autumn preceding. You thus take advantage of the beneficial operation of frosts in the winter, which pulverize the soil to better effect than any mechanical means. And, often, when ploughing is well done in autumn, it will not be necessary to renew it in the spring. We have seen very fine crops of Indian corn, raised on land which had been strongly swarded with grass, and had received but one ploughing, which was given some time in the summer or fall preceding the season in which the crop was planted. But it is necessary in such case that the ploughing be deep, and the furrow completely turned, so that every particle of the grass may be buried. In great Britain, where labor is comparatively much cheaper than in the United States, spring-ploughing is often dispensed with. A very eminent agriculturist observed that "the preferable method of sowing oats, and especially in a clay soil, is to turn the field over, after harvest, and to lay it open to the influences of frost and air; which lessen the tenacity of the clay and reduce it to a fine mould. The surface soil by this means, is finely mellowed for the reception of the seed; which it would be a pity to bury by a second ploughing, before sowing. We are taught by experience, that this soil, ploughed before winter, is sooner dry, than when the ploughing is delayed till spring; and as early sowing is a great advantage, any objection on account of the superficial crusting is easily removed by a strong harrow, which would produce abundance of mould for covering the seed."§ Sir John Sinclair, likewise, says that "ploughing lands in spring, when sufficiently clear, and prepared be-

fore winter, is an unnecessary increase of labor. He allows, however, that cases may occur, which spring ploughing may be advisable: oats, barley, &c. in order to subdue weeds. Likewise, on hard, stony soils, or where ploughing has been imperfectly executed, spring ploughing becomes requisite. But whether the land is ploughed in the spring or not, ploughing in autumn has many advantages, among which that of exposing worms and other insects, which infest the soil, to the intense frosts of winter, not the least.

WORKING OXEN.—It has been asserted that working oxen perform their spring work better for being fed two or three times a day with a few ears of Indian corn. This kind of food is, however, thought by others, to possess a heating quality and they therefore prefer raw potatoes, which, they say, operate both as food and physic, and cool and strengthen the animal.

PASTURE FOR SWINE.—A lot well seeded down to clover has been recommended by good farmers as highly useful for pasturing swine. The quantity of land should be so proportioned to the number of swine that they may keep the grass from going to seed. This will prevent waste, and the shorter the grass is the sweeter it will be, and the more agreeable to the palate of this kind of epicures. It was the opinion of Dr. Deane, that one acre of rich land in clover would support twenty or more swine, large at small, through the summer, and bring them well forward in their growth. The hogs should be well ringed, or, it is said by an English writer that shaving off the gristle of young pigs with a sharp knife, will answer the purpose of preventing them from rooting, and be better for the animals than ringing. Arthur Young, a famous English writer on Agriculture, pastured six four swine, of various sizes, on two acres of ground. The pig-pasture should have a good supply of water. A few sweet apple trees growing in the pasture, will furnish a kind of food, which will assist to increase the growth and will in part fatten the swine. Hogs, however, should not be turned into their pasture till about the first of May; but those who have not a clover pasture for their use may set about preparing one as soon as they please.

PRUNING FRUIT TREES.—Many farmers have been in the habit of pruning their fruit trees in February and March, but this is wrong. "In March the sap is retained in the roots, and the bark adheres closely to the wood; consequently, the wounds occasioned by the amputation of branches being exposed to the cold, penetrating winds and frosts, before the circulation of the sap, become dry, rotten and cankered, an often crack open near to the main trunk. In old orchards, particularly, if limbs of any considerable size are lopped off, several inches from the trunk, before the sap is in active motion, the fresh bark round the wood becomes dry; large cavities are formed, which rapidly extend towards the trunk and heart, and the tree is soon deprived of its health and vigor. In our New England climate, we have the clearest indications that the sap commences its circulation about the 10th of April. From this period to about the last of May, whether the buds are just opening or the blossoms fully expanded, the pruning should be accomplished."¶ The

§ Kaimes' Gentleman Farmer.

* Code of Agriculture.

† Thacher's American Orchardist, p. 64.

Mr. Pickering, likewise says that his practice has been to prune in the spring, beginning when the buds have scarcely begun to swell, and ending before the expansion of the leaves. Mr. Forsyth, likewise, in his Treatise on Fruit Trees (p. 13, Cobbett's Edition) says, "I have a great dislike to autumnal pruning, and in the spring, when the sap is beginning to flow, the knife, the lips will quickly grow."—The writer whose essay on the subject of apiculture, is published in the *Massachusetts Agricultural Repository*, p. 121 to 127, in stating errors in the mode of managing orchards, says that beginning to prune in March, when there is still much wet and frosty weather, and no activity in the sap of the tree, is very injurious. These authorities are produced to show what should not be done, till the sap is further advanced; and to evince that the application of labor is oftentimes more detrimental to a farmer, than sheer idleness.

EARLY PEAS.—As soon as possible prepare an acre of ground for the reception of peas. Cobbett gives the following directions for sowing peas. "I ploughed the ground into four foot ridges, the tops of which (for the dwarf sorts) I raised four feet apart. I then put a good parcel of dung into the furrows; and ploughed it up back upon the dung. I then levelled the top of the ridge a little, and drew two drills upon it at six inches distant from each other. In these I sowed the peas. When the peas were about three inches high, I hoed the ground deep and well between the rows and on the outside of them. I then ploughed the ground from them and to them again, in the same way as in the case of Swedish Turnips. In a week or two afterwards they had their second ploughing; and soon after they fell and covered the sides of the ridges. When not covered, and sown upon level ground, peas fall very irregularly, and in case of much wet, the pods rot; but from the ridges they fall evenly, and the wet does not lodge about them. You walk up the furrows to gather the peas, and nothing can be more beautiful or convenient. The culture in the garden is exactly the same, except that the work which is done with the plough, in the field, must in the garden be done with the spade."—*American Gardener*, Par. 241. Mr. McMahon directs, "in order to give the first early crops a greater advantage, prepare a south border of dry light soil for their reception, and raise the earth on the sloping ridges, about a foot broad at the top, and nine inches high, and at the distance of three feet from each other; ranging the border on a south west direction, from the north to the south; then on the easterly sides of the ridges about half their height, sow your first peas, pretty thick, covering them about an inch and an half, or if the land be very sandy and light, two inches, or if of a stiff nature, one inch in depth. In this situation, they will have all the advantage of the morning and evening sun, lie dry, and will consequently be in vegetation much more rapidly than when sown in the ordinary way."—*American Gardener*, Calendar.

Mr. Deane observed that for field peas, land newly ploughed out of sward is generally the best; and land which is high and dry, and has not been too much dunged. The sorts, which grow large, should have a weaker soil; in a stronger soil the smaller sorts answer. Our farmers do not commonly allow a sufficient quantity of seed for peas in broad cast sowing. When sowed thin they lie upon the ground, but if sowed thick they hold each other up. Mr. Deane recommended three bushels to an acre. In sowing peas in rows which grow six or seven feet high, to have the rows 12 or 14 feet apart, with rows of carrots or onions, &c. between them is thought a good practice.

WAR DECLARED!—The Brig *Parthian*, Capt. Nye, has arrived at New Bedford, in 35 days from Lisbon. Capt. Nye reports, that the day before he sailed, Mr. Hutchinson, our Consul there, informed him, that accounts had been received of WAR'S BEING DECLARED BETWEEN FRANCE AND SPAIN.

AGRICULTURAL SOCIETY IN VIRGINIA.
A meeting of "The Agricultural Society of the Valley," was held at Winchester, (Va.) on the 1st inst., and after a very able address from the President, and some other proceedings of local interest, Mr. William M. Barton presented to the Society some Flax, cleaned by a new invented machine, accompanied by a letter from Gen. Samuel Swartout, of New York, in which he describes the facility with which one man can clean flax, amounting to 100 lbs. cleaned for the huckle in one day—the price to be \$100. The machine, owing to some disappointment, was not exhibited. The same gentleman presented some *rape* or *cole seed*, a present from the Hon. De Witt Clinton, of New York, which was assigned to Edward McGuire, Esq. Treasurer, for distribution among the most careful farmers. "This plant has long been celebrated in Ireland and England, for its great utility in feeding sheep, as being remarkably hardy and capable of sustaining the most severe winter without injury. It is a species of cabbage, and is also celebrated for the oil it produces, which answers for burning in lamps. The cake also is valuable for feeding cattle, and serves as a manure." A letter was presented to the Society by Mr. Wm. M. Barton, from Judge Buel, of Albany, N. Y. giving an account of his mode of cultivating the Ruta Baga, or Swedish turnip, upon a clover lay previously mowed, in which he was very successful, the acre having produced 500 bushels.

The following gentlemen were chosen honorary members of this Society:—Hon. De Witt Clinton and Jesse Buel, Esq. of the State of New York; Hon. Josiah Quincy, Thomas L. Winthrop, Esq. S. W. Pomeroy, Esq. and Dr. Dexter, of or near Boston.

Exhibition of Horses.—We learn from the last N. Hampton Gazette, that "the Executive Committee of the Hampshire, Franklin and Hampden Agricultural Society, propose to their fellow citizens of the three counties, to have an exhibition of Horses, in the village of Springfield, in the county of Hampden, on Wednesday, the 21st day of May next." They likewise offer premiums to the amount, in all of \$131, for the best stud horse, breeding mare, gelding horses, &c. &c.

Safford's Straw Cutter.—We have seen a Machine in operation for cutting straw, &c. invented by Mr. Noah Safford, of Springfield, Vermont, which we believe to combine more advantages than any other ever put in use, taking into consideration its cheapness, simplicity, &c. We are well assured that it will cut, with the moderate labor of one man, a bushel of straw in a minute, or sixty bushels in an hour. The notice of the improvement which is given in Mr. S.'s advertisement, together with the testimonial in its favor, bearing the signatures of persons who are good judges of the merits of machinery of this sort, supersede the necessity of any further remarks from us.

We are compelled, for want of room, to omit several articles intended for this day's paper; and among others an advertisement for Mr. Osborn's Poems, which shall appear in our next.

DIED.—In Washington, on the 17th inst. the Hon. BROCKHOUS LIVINGSTON, one of the Judges of the Supreme Court of the United States, aged 65.

NEW GARDEN SEEDS.

FOR sale, by GEO. MERDOCK, No. 14, Market Square, a great variety of English and American GARDEN SEEDS, of the last year's growth; consisting of early French Hot put and Chardion Peas; early and late Cabbage; early and late Cauliflower; Sweet Marjoram, Thyme, &c. with every other seed suitable for a Kitchen Garden. Also, 10 lbs. Mangel Wurzel or Scurdity—100 lbs. Ruta Baga or Swedish Turnip—a quantity of Amuck or Carrot. March 29.—6w

SAFFORD'S STRAW CUTTER.

THE utility of cutting Hay, Straw, and other substances for feeding cattle, is now so universally acknowledged that any remarks on the subject must be deemed superfluous. The following Certificate will therefore be conclusive of the merits of the above mentioned Machine.

Boston, March 22, 1832.

We, the subscribers, have in operation a Straw Cutting Machine invented and exhibited in this city by Noah Safford, and we do not hesitate to say that in our opinion it exceeds any other we have ever seen, for cheapness, simplicity, despatch and durability.

STEPHEN HARTWELL, SPURN & HOLMES,
HEZEKIAH EARL, ANDREW SLATER.

The above mentioned Machines may be had of J. R. NEWELL, at the Agricultural Establishment, No. 20, Merchant's Row, Boston. Price \$15.

THE FARMER.—BY T. G. FESSENDEN.

Let mottled blockhead's roll in wealth,
Let proud fools strut in state,
My hands, my homestead and my health
Place me above the great.

I never fawn, nor flib, nor feign,
To please old Mammon's fry;
But independence still maintain
On all beneath the sky.

Thus Cincinnatus, at his plough,
With more true glory shone,
Than Caesar with his laurel'd brow,
His palace and his throne.

Tumult, perplexity and care
Are bold ambition's lot;
But those intruders never dare
Disturb my peaceful cot.

Blest with bare competence, I find
What monarch's never can,
Health, and tranquillity of mind,
Heaven's choicest gifts to man.

The toil with which I till the ground
For exercise is meet—
Is mere amusement, which is crown'd
With slumber sound and sweet.

But those who toil in pleasure's rounds,
Sweet slumber soon destroy;
Soon find, on dissipation's grounds,
A grave for every joy.

ON THE VOWELS.

We are little airy creatures.
All of different voice and features;
One of us in glass is set,
One of us you'll find in jet,
One you may perceive in tin,
And the fourth a box within;
If the fifth you should pursue
It can never fly from you;
The sixth you always may espy
Lurking in a lover's eye.

Lord Mansfield was not a dandy.—One day when Lord Mansfield was sitting for his picture, Sir Joshua Reynolds, who painted the portrait, asked him if he thought it a likeness? His Lordship replied, that it was not in his power to judge of its degree of resemblance, as he had not seen his own face in a looking glass during the last thirty years of his life; for his servant always dressed him, and put on his wig, which therefore rendered it unnecessary for him to look at himself in a mirror.

Judge Brackenridge, in reprimanding a criminal, amongst other *hard names*, called him a scoundrel. The prisoner replied—"Sir, I am not so great a scoundrel as your honor takes me to be." "Put your words closer together," said the Judge.

An auctioneer at a late sale of antiquities, put up a helmet, with the following candid observation: "This, ladies and gentlemen, is a helmet of Romulus, the Roman Founder; but whether he was a brass or iron founder I cannot tell."

Authors are like asparagus; there is nothing good about them but the head.

April is much like a pretty woman, being full of sweets, and having both tears and smiles at command.

From the West Chester Republican.

WEEVILS.—Remarks on their habits, and means of destroying them.

As much injury is done in barns to the different kinds of grain, by these insects, I wish the society to devote some attention to the most efficacious method of destroying them, or preventing their ravages. I have endeavored, for several years, to become acquainted with their habits, and am willing to state the result of my conclusions, hoping it may occasion, from some abler pen, more important information. I believe they continue residents for life, of the buildings in which chance may place them, and that they do not migrate from one barn to another, unless carried thither. That during the winter they lie in a dormant state near the ground. I have found numbers of them at that season on the lower sides of boards which were lying under the mangers in stables. Instinct, no doubt, teaches them at the commencement of cold weather, to seek a retreat where they may lie secure, and where they will be somewhat sheltered from intense cold. Had they remained in the mow, on threshing the grain, they being in a dormant state, would probably be destroyed. About the middle of the 5th month, May, they begin to travel, crawling up the walls, and in every direction in search of food. If any grain be in the barn, they find it; and I have seen as many as eight or ten on one grain of Indian corn, the eye of which they at first consume. When wheat, rye, or barley, is brought into the barn, they penetrate the mow, and I apprehend, deposit their eggs in the grain, which serves for food for the young insects, till they arrive at nearly the size of the parents; probably the sweating and the warmth of the mow, much assist in the depositing of the egg, and in bringing the insect to perfection.

As a proof that the egg is deposited in the grain, it will be found, that if wheat be threshed some short time after harvest, in barns where weevils abound, when it will be very little eaten by them, and put into bags, and perhaps few of the insects then to be seen, that in a few weeks it will be very much eaten, and numbers of weevils in the bags. Having thus briefly stated my opinion of their habits, I will suggest a few propositions for destroying them. The most efficacious mode, I apprehend, would be to stack the grain out for one or two years, and keep all kinds of it from lying in the barn, during the summer season; by this means they would be deprived of food and of a suitable place to deposit their young.

Many of them may be destroyed by having no grain in the barn from the time they leave their winter retreat, till harvest; except about a double handful of Indian corn in a place, and in several different places. Numbers of them will go to these heaps for food, then about once in two days riddle them in some clean place with a wheat riddle, the insects will fall through, which may be gathered up and thrown into the fire. Another method is to leave a little straw in the stables at this season, and before harvest gather it all up carefully, and draw it out into a field, many weevils will thus be taken out and perish. It is said, though I have never experienced it, that they have a great antipathy to hemp, that a few layers of it, spread among the grain, at the time of putting it in the barn, will

prevent their ravages. No doubt, members of the society, and others are possessed of facts on this subject which would be highly interesting to those who are troubled with these insects about their barns. It is hoped they will be introduced, through the medium of the society, otherwise, to make them public, as it may be the means of saving many bushels of grain annually for the benefit of the community.

ISAAC SHARPLES

From the Connecticut Courant.

CANADA THISTLE.

A few days since I called on a member of the Litchfield County Agricultural Society, who showed me a piece of ground from which he had easily and effectually eradicated the *Canada Thistle*. As this subject is becoming very interesting to this portion of the country, I trust an account of the process by which this object effected will not be unacceptable to your cultural readers.

The secret consists in cutting off the weed near the ground at the *change of the moon*, the *new moon*, as near the change as possible in *June or July*. This, my informant says, generally destroy all the plants the first year, should any shoots sprout the next year, the same course be pursued, and in two or three years there will not a root remain.

This process of course is better adapted to cases where the evil has but just commenced. This is the third year from the commencement of the operation on the small piece I was shown, from two to four rods square; and at the same time not a *Canada Thistle* is to be found there, although three years since they constituted the principal growth. That the circumstances attending this case were correctly detailed confirmed to me by a neighbor of my informant, who was present, and who had witnessed the whole process. He informed me that he derived his information from a farmer in Litchfield county, by whom, and in whose view this course has been extensively pursued with uniform success. The discovery was made, as I am informed, through the channel, by an observing farmer in Troy. Some years since, being much infested with these troublesome weeds, he cut down a quantity of them in the vicinity of his house, was surprised to find the next year that he had thus served did not shoot up. Upon recurring to dates, he found they had been cut exactly at the change of the moon in June. This induced a second experiment, which produced the same result; but subsequent and more extensive experiments determined the best time for cutting these insidious weeds to be as I have before stated.

No. 36.

ON SAVING AND MAKING THE MOST OF MANURE.

BY THE EDITOR.

(Continued from p. 215.)

We have already been somewhat copious in our observations relative to collecting and applying *liquid manure*.* But this is a *fruitful* topic; and, as manure is the *farmer's indispensable*, it is therefore an *important* topic. We are aware that we can write nothing upon the subject which will prove quite so amusing to what is denominated the *gentle* part of our population as the "Pioneers," or "Peverill of the Peak." Still, we are inclined to think, with the leave of novel-readers, dandies, victims of sensibility, ladies, gentlemen, gentlemen's ladies, and the rest of "nature's porcelain," that our remarks on Manure may prove quite as *useful* to a farmer and his family, as the most fascinating productions of the "GREAT UNKNOWN," or those of his American compeer. But, lest our opinion, as respects the paramount claims of the matter under consideration to our reader's respectful attention, should be thought not exactly orthodox, we will condescend to fortify ourselves with a little "chopped logic," so called by masters of rhetoric. "All flesh is grass;" but grass will not grow to advantage without *manure*—therefore *all flesh* (including ladies and gentlemen) has a direct interest in saving and making the most of this last mentioned article.

The same or similar receptacles to those already used for containing the stale of cattle, or draining of dunghills, &c. may likewise serve as repositories for soap suds, dish water, and those more offensive substances, which will sometimes make their way into the best of families. It will not be very expensive, compared with the importance of the object, to conduct every thing of this nature, by suitable pipes, or covered drains, to a dung pit, or other proper reservoir, where they may be either incorporated with earth and form a valuable compost, or, perhaps, after being diluted with water, applied to plants in the garden, or to crops near the homestead. No head of a family, who has any regard to health as well as cleanliness and economy, will suffer any noxious or putrid substances to contaminate the air about his dwelling; he will reflect that such nuisances not only fret the senses of sight and smell, but assault the constitution; and though they may not immediately convert his house into a hospital, they add the air with the seeds of debility, and generate slow, nervous and typhus fevers. Indeed they are hardly exceeded by morning draughts in causing that languor which makes life a burthen.

"A long disease which death alone can cure."

Yet the house-yards as well as the barn-yards and other premises of some farmers may be polluted at a very unreasonable distance. Instead of pure country air, they are surrounded with poisonous exhalations, and their habitations are fit for the residence of no animals but such as Shakspeare mentions, which "live on the vapors of a dunghill." This is the more worthy of censure because it may be easily pre-

vented. A proper quantity of fresh earth, mixed with or thrown over any putrescent, mouldy, or fermenting substances, absorbs every thing offensive or injurious, and changes the causes of pestilence into the sources of fertility. Among other things, night soil or privy manure, should, at least in warm weather, two or three times a week, (or better every day) be covered or incorporated with several times its bulk of fresh loam; and if a little lime is mixed with the other ingredients, the compound will retain no bad odour.*

Some people will doubtless tell us that our directions are well enough in theory, and will do for "Gentleman Farmers," but would cost too much for common farmers to put in practice. Health, however, can hardly be purchased too dearly. "Skin for skin, yea, all that a man hath will he give for his life;" and life without health is scarcely a blessing. Pure air is as necessary for health as pure water, or wholesome food. Besides, the expense of the necessary implements, pipes, reservoirs, &c. in the first instance, cannot be great, and after those are made, a habit of cleanliness, and attention to what may be deemed small, but are really important matters is almost all that is required. There is nothing so expensive as negligence; carelessness is very costly, and he who will not or cannot afford the money or labor necessary for the proper pursuit of his vocation, will find parsimony to be the highway to poverty; and that "there is nothing like poverty for keeping a man poor."

With regard to the exact manner in which the pipes and reservoirs of liquid manure should be constructed we shall add but little to what has been already observed, but leave the reader, who may have a use for such conveniences to the exercise of his own ingenuity. Those who have cellars under their barns, or can conveniently form such cellars, will perhaps do well to make them the receptacles of all the liquid as well as solid matter, which is valuable for manure. Those who have not, or cannot afford, or do not wish for such cellars, may, perhaps, derive useful hints from the following passages, extracted from the writings of an able author, whom we have frequently had occasion to quote.

"It would be injudicious to recommend here

* "Night soil, it is well known, is a very powerful manure, and very liable to decomposition. From the analysis of Berzelius, it appears that a part of it is always soluble in water; and in whatever state it is used, whether recent or fermented, it supplies abundance of food to plants. The disagreeable smell of night soil may be destroyed by mixing it with quick lime; and it exposed to the atmosphere in thin layers strewed over with quick lime, in fine weather it speedily dries, is easily pulverized, and in this state may be used in the same manner as rape cake, and delivered into the furrow with the seed.

"The Chinese, who have more practical knowledge of the use and application of manures than any other people existing, mix their night soil with one third of its weight of a fat marble, make it into cakes, and dry it by exposure to the sun. These cakes, we are informed by the French missionaries, have no disagreeable smell, and form a common article of commerce of the empire."—*Agricultural Chemistry*.

[in Nova Scotia] the identical plan of construction for a dunghill, which is prevalent in England; yet at the same time, a brief description of this necessary part of farm building as conducted at home, would not be altogether useless. The general principles are the same in all places, and in all countries; although the manner of applying them may be different and accommodated to circumstances. The out-houses or offices, attached to every farm of any extent, are generally arranged in a square form, leaving an area in the centre, which is surrounded on all sides by a foot pavement. Here a pit is opened, varying from two to three feet in depth, and proportioned to the size of the area; paved either at bottom with flag stones, or coated with clay—the cow house, the pig-stye, the feeding stall, the stable are all so contrived, that the urine and vegetable juices, in the separate subdivisions flow inward, and empty themselves into this excavation. It is the common receptacle of all the dung made by the cattle, of the refuse of the kitchen, of the sweepings of the barn-floor, and in short, of all the waste of the farm.

"First of all, a coating of common mould, by most of the enlightened and scientific agriculturists, is spread all along the pavement of this pit, from 9 to 15 inches deep, according to the convenience or fancy of the operator. On this the manure is laid, as it is brought by a wheelbarrow out of the different offices and stalls. When fermentation becomes violent, and this is indicated by the heat and strength of the vapor, the cleaning of ditches and roads, or, in want of these, common earth are carted, often from a considerable distance, and regularly spread over the dunghill. The gases are thus absorbed and prevented from escaping; and recourse is had to this remedy, whenever the rapidity of the putrefactive process points out its necessity. According to this plan, there is no waste nor carelessness in the management of the manure. The mould at bottom imbibes greedily the saturated liquor which sinks downward; and that which is intermingled with the whole mass fixes and retains the gases—so often described as the elementary principles of the decomposing matter. From experience it is discovered that the earthly materials which are thus added to the animal and vegetable substances, are impregnated with as nutritive virtues as the dung itself; and that they increase the bulk and value of the manure by their whole amount."

The same author also gives the following directions for the same purpose, which, though mostly coinciding with the foregoing, are, in some particulars, more definite.

"With respect to the formation of a dung pit, I would recommend that a place be chosen near the barn, which should be dug about three feet deep, and of a size proportionate to the stock of cattle usually kept by the farmer. It is not necessary that it should be built round with a wall, or have a perpendicular descent, as it may slope gently inwards, and deepen gradually towards the centre. After it is thus

* See pages 190, 191, 214

* Letters of Agricola, p. 204, 205.

hollowed out, the texture of the bottom should be examined, and if found firm, impervious, and capable of containing the juices, no further trouble is requisite, and the work is complete; but, if open and porous, it should be coated with clay, and lined with large and coarse flags [paving stones.] Into this pit, earth from some neighboring field should be first brought, and strewn over the bottom and sloping sides, to the thickness of from 9 to 12 inches. Thus a safe depository will be prepared, for the cleanings of the barn, for the waste straw and weeds, for the sweepings of the kitchen, for the stems of peas, beans, cabbages, potatoes, and in short all vegetable matter of woody fibre, as well as for the dung of the feeding cattle, after a complete layer of putrescible matter has been spread all over, and when the symptoms of an active fermentation have become visible, the earth, which was thrown out of the excavation, may be slowly returned, and scattered on the surface of the heap, to catch the exhalations which are ascending. Hither, too, the urine should either be conducted by a drain, or carried by buckets; for it is an unpardonable waste to lose the benefit of this rich and invigorating manure. The earth, which lies at the bottom will greedily drink up the urine and the vegetable juices, and thus gain a large accession of nutriment and value. So soon as the pit is filled up in the manner herein described, it should be emptied of all its contents; and these should be carted to the field where they are meant to be afterwards applied, and there laid down in some convenient corner, to be mixed up and sorted into a profitable compost. The pit—adjoining the barn—may be again lined with mould, and the former operations repeated in procuring and augmenting its contents.

During summer, this pit should be emptied twice or thrice according to circumstances; and its fermentable and earthy materials transported to the ground which they are destined to fertilize, and there subjected to a new process. Towards the fall, which by its length and mildness makes amends for the advantages of more favored regions, all those compost heaps, as well as the dung about the barn yard, should be spread on the land, which is meant to be immediately ploughed. In the mean time an additional stratum of mould should be distributed along the bottom and side of the pit before the approach of winter, and during that rigid season, the dung may be accumulated without any extraordinary care, as the intensity of the cold is unfavorable to putrefaction, and little loss will be sustained from the dissipation of the gaseous matter. Such farmers as may choose to take the trouble, and have suitable convenience of covered sheds, may pile up before hand a quantity of dry earth, which may be scattered over the dunghill in the depth of winter, on such places as indicate strong fermentation.*

The dung-pit (or stercorary as the learned call it) will prove of the least use in those seasons of the year, when the stock is kept mostly in pastures, or the weather is such that the manure is constantly frozen. But greater or less accessions may be made to such pits or reservoirs at all seasons of the year. In summer, if the stock is neither yarded nor stabled, the kitchen, the sty, &c. will add something to the

dung-pit, and those who have their manure pits in cellars under their barns, (which is undoubtedly the best practice) may keep their manure manufactory in successful operation in almost any extremity of cold to which our climate is subjected. Wherever the manure pit is situated, it ought to be covered from the sun and rain; and its contents ought not to be suffered long to undergo the putrefactive process without earth, peat, or some suitable substance to absorb its gaseous products. The farmer may vary his plans for saving and making the most of every substance which is suitable for, or can be converted into manure, as his judgment may direct; but he should recollect that whenever he manages in such a manner as to "manure the atmosphere," instead of his land or his plants, he over steps or falls short of the line of his duty, and hardly deserves his honorable office of an independent cultivator of the soil.

(TO BE CONTINUED.)

To stop the Rapidity of Flames when the Female Dress happens accidentally to take Fire.

If a woollen cloth was constantly kept in nurseries and sitting-rooms, especially when there are fires, laid loose upon the table, or other piece of furniture, this being always at hand, might be easily resorted to in case of accident, and being wrapt tight round the flames, or strongly pressed against them, would, by excluding the air, in many instances, soon extinguish the fire. A green baize cloth being very pliable, and likewise a neat cover to furniture, is recommended for this purpose; and if such were known in the family by the name of the *Stifling Cloth*, it probably would as readily be used when there was occasion for it, as fire engines and buckets are now. Where the convenience of baize cloth cannot be easily procured, as in cottages, &c. a cloth cloak, riding-coat, or blanket, will answer much the same purpose. A man's coat will always be useful; and the first man that arrives ought to apply it.

To stop Cracks in Glass Vessels.

The cracks of glass vessels may be mended, by daubing them with a suitable piece of linen over with white of egg, strewing both over with finely powdered quicklime, and instantly applying the linen closely and evenly.

Cement for preserving Wood and Brick.

This composition is formed of the following materials, viz. mineral or coal tar, pulverized coal, (charcoal is esteemed the best) and fine well slacked lime; the coal and lime to be well mixed together, proportioned at about four-fifths coal and one fifth lime: the tar to be heated, and while hot thickened with the mixture of coal and lime, until it becomes so hard that it may be easily spread upon the surface of a board, and not run when hot. Turpentine or pitch will answer nearly as well as tar, and plaster of Paris will answer instead of lime; to be used in the same manner, and in about the same proportions. The cement must be applied warm, and is found to be used easiest with a trowel.

Cement for Wood or Paper.

Dissolve some isinglass in a small quantity of gin or proof spirit, by a very gentle heat; and preserve it in a bottle for use.

FOR THE NEW ENGLAND FARMER.

MR. EDITOR—Having seen nothing in your valuable paper respecting making manure from swine, I have been induced to send you for publication, my method of making hog manure, as it is generally termed, together with a brief sketch of its qualities and effects.

I generally keep and fatten four hogs each year. I keep them in two separate apartments because I think they do much better when kept in two pens, than when kept all together. I have a tight, warm house for them to lie in, and a yard fifteen feet square, into which I frequently throw loam, and swamp mud. I keep them well supplied with straw in their house, but do not suffer it to remain therein more than a week, when I remove all from the house in the yard, and supply them with fresh straw. In the spring and summer I frequently collect large quantities of weeds, and put into the yard some of which they devour, the remainder trodden under foot, which, together with the loam and straw, is frequently and thoroughly worked over by them. In this way I make from twenty to thirty loads of manure in a year, which answers a more valuable purpose than any other kind of manure I make use of. Manure of this kind, seems to be of a moist, nutritious nature, and always has a good effect, especially when used on dry, sandy or gravelly land. Corn or any other kind of vegetable manured therewith, will endure the drouth much better than when manured with other kinds of manure. I think the most valuable use to which it can be applied, is to manure corn in the hill. It answers well for potatoes and most other kinds of vegetables.

A. FARWELL.

Worcester, March 28, 1823.

Report of the Committee of the Essex Agricultural Society, on the Management of Farms—from a pamphlet published by said Society in October last.

The Committee appointed by the Trustees of the Essex Agricultural Society, to examine the claims for premium for the best Management of a Farm, submit the following Report: That they have received but four claims on this subject, viz. from the Hon. William Bartlet, of Newburyport, for his farm in Methuen; from Col. Jesse Putnam and Capt. Dudley Bradstreet, of Danvers; and from Mr. Isaac Dodge, of Hamilton.

Each of these farms was visited by the Committee in the month of July, when vegetation was most flourishing; and the several statements of the claimants annexed to this report have been carefully examined.

The farm of Mr. Bartlet in Methuen is in a very high and superior state of cultivation. It consists of about two hundred acres of land; conveniently divided into lots; and well fenced with the best of fences, Stone Wall. The order and neatness with which all the business of the farm is conducted merits high approbation. The lands have been much improved by the removal of the stones for the building of walls and laying covered drains, by means of which waste lands have been converted into fine cultivated fields. Great attention is paid to obtaining manure, and an abundant supply is made to the farm. But most of all were the Committ

* Letters of Agricola, page 220.

ased with the habits of sobriety and temperance inculcated upon the laborers, and with the fact, that so large a farm, employing many hands, was carried on entirely without the use of ardent spirit at any season of the year. Would our farmers generally imitate this example, they would soon find themselves relieved from the heaviest tax with which they are at present burthened. Your Committee are well aware of the advantages, in point of capital, possessed by Mr. Bartlett, over most other farmers in the county. Still they consider the improvements he has made, such as are within means of, and worthy of imitation by, our farmers generally; and they are of the opinion that he is entitled to the first premium of *thirty* *dollars*.

The farm of Col. Jesse Putnam, of Danvers, consists of about 114 acres of land, and is well cultivated. The orchards are superior to any have seen in the county, and the management of the young trees appears to be excellent. The methods pursued by Col. Putnam of subduing the rough lands, and reclaiming his wet meadows, and turning them to fertile fields, are highly judicious. Great attention has been given on this farm to the making manure; and much benefit has been derived from the swine his particular. On the whole, your Committee are of the opinion, that Col. Putnam is entitled to the second premium of *twenty* *dollars*.

The farm of Capt. Dudley Bradstreet, of Danvers, consists of about 192 acres of land, and is well cultivated. The careful and accurate mode of proceeding pursued by Mr. Bradstreet is worthy of approbation. The crops on his farm appeared very fine; and his mode of management in general worthy of imitation. The Committee were particularly pleased with the cultivation of a piece of swamp land, which, by the skill and industry of Mr. Bradstreet has been made to produce an abundant crop of English hay.

In examining the farm of Mr. Isaac Dodge, of Hamilton, the Committee are fully convinced in the opinion expressed in the report of the last year. They consider Mr. Dodge entitled to the approbation of the Society, for his industry and skill in the cultivation of lands, and the zeal he has manifested in promoting its interests. There has not been sufficient time since the last year for him to make the essential improvements. His crops, the last year, appeared very fine.

Your Committee cannot close this Report without expressing their regret, that there are so few competitors for the premiums on the management of a farm. They are sensible that there are farms in every town in the county that would well bear an examination; and perhaps many that would compare well with these they have been called upon to examine; but as the proprietors did not come forward to their claims, it was not in the power of the Committee to bring them into the comparison. Should these premiums be continued, it can be hoped that all our good farmers will volunteer their assistance in a cause, in which to fail is no disgrace, but to succeed is the highest honor.

JOHN ADAMS,
TEMPLE CUTLER, } Committee.

Danvers, November 20, 1822.

NEW PERIODICAL WORK.

A new publication entitled "Collections, Historical and Miscellaneous, and Monthly Literary Journal," published by Jacob B. Moore, has lately been established at Concord, N. H. It has reached the 4th No. and merits liberal patronage and extensive circulation. It may serve to perpetuate the memory of worthy men, and worthy deeds, which, without such a work, might float down the current of time into the dead sea of oblivion. Some original pieces which have appeared in the work possess much merit. The biographical part must be interesting to every true American, as it bestows and promises the meed of fame to those who have benefited their country, and adorned society. The following is extracted from the last number.

FIRST SETTLEMENT OF NEW HAMPSHIRE.

Wile o'er the wilderness of waves,
Untracked by human peril,
Our fathers roamed for peaceful graves,
To deserts dark and sterile.
Their deathless hearts no meteor led,
In terror, o'er the ocean;
From fortune and from fame they fled,
To heaven and its devotion.
Fate cannot bind the high-born mind
To bigot usurpation:
They, who had left a world behind,
Now gave that world a nation.

PAINE.

Though the adventurers who formed the humble colony first planted at Pascataqua were of different habits from the pilgrims who settled at Plymouth, and may not have imitated their examples, nor have been drawn into the close ties which mutual danger serves to create and strengthen,—there is still something interesting, to us at least, in the circumstances of their landing. The discovery of this continent had already freighted the four winds with exalted ideas of its extent and value, when the intrepid Smith, born with "a roving and romantic genius, and delighting in extravagant and daring actions,"* directed his attention to North America. He had explored the coast of Virginia, been a captive among the natives, and a father to the infant colony,—by his courage intimidating, or by his address controlling the fancies of the Indians; and now extended his enterprises still farther north into unknown seas, ranging from east to west, and touching at the various islands stretching along the coast as if to defend the newly discovered continent from the violence of the stormy Atlantic. Smith landed upon the islands formerly called by his name, but at present known as the Isles of Shoals.†

To the country east of Virginia he gave the name of *New England*. New Hampshire was called *Laconia*. There are found in most countries, men hardy enough to brave the rigors of the ocean and inclement seasons, for the prospect of gain, or of personal liberty. A howling wilderness, though its front may inspire awe, cannot subdue the hopes of the adventurer. He fancies mines of wealth concealed in the recesses of the country—golden dreams cheer his midnight slumbers, and inspire his hours of wakefulness. Or on the other hand, the oppressed may court the dangers of the deep, can they but afford a refuge from the soul-sickening scourges of religious tyranny. While most of

* Belknap.

† Smith discovered these islands in 1614. It is not known for what reason their name was altered. In the deed of the Indian sagamores to John Wheelwright in 1629, "the Isles of Shoals, so called by the English," are included.

the settlers of New England had one of these objects in view, it is not difficult to perceive that the former had a powerful influence with the early inhabitants of New Hampshire. A few humble fishermen from London were our common fathers. Cheered alike with the prospect of accumulating wealth, and tasting its enjoyments, they pitched their tents at *Little Harbor* on the Piscataqua, in 1623. The season of their landing is well known, and the place, with many circumstances attending it. It is now NEARLY TWO CENTURIES SINCE THE EVENT TOOK PLACE.

From the New York National Advocate

CONSUMPTIONS.

On looking over the bills of mortality for the year 1822, we find that 1692 men and women died in this city, and out of nearly ninety different diseases 621 were of consumption alone. It would seem from the number of victims to this fatal disorder that it is an endemic disease. This is not the fact, our climate does not produce this disease; it is the origin of carelessness, and indifference to clothing, habits and changes of atmosphere. A common cold caught from carelessness, and running into a confirmed consumption by inattention, may be cited as the undeviating origin, and if we find children pale, sickly and puny, we shall discover that their parents were affected with a touch of this insidious disease. We have always believed that wet or damp feet were the cause of colds and consumptions, and how easy it is to sacrifice a little pride and fashion to ensure health and comfort? Yesterday was sloppy walking, though a fine atmosphere prevailed, yet we saw many ladies walking in Broadway with prunella shoes. A thin covering of leather only kept the wet from penetrating the soles of their feet and shooting up its damp and deadly venom to the breast, there first to produce a cough and then a slow hectic disorder, until the fell monster, consumption, hurries them to the grave, full of hope, youth and expectation.

Now, is it a great sacrifice to wear neat overshoes, and keep their feet dry? Will it ruin their shapes if they keep on their flannels a little longer? Is it any consequence what Billy Fribble says about their appearance on the promenade? Suppose they catch cold and it wears off; they must nurse themselves, bathe their feet, drink catnip tea, barley water, and lie in bed a day or two; be nursed, coaxed, and scolded; and, before they are strong again, out they sally, with kid slippers and naked elbows; and then in bed again, and send for Doctor Hosack.

We submit to our Knickerbockers, whether, in good old times when women wore pattens, and clattered over the muddy pavements, they ever died of consumptions? Whether they ever had inflammation on the lungs, or rheumatism, when they dressed in stiff brocades and quilted petticoats? Rely upon it, that in the bills of mortality we shall have to add a new disease, viz: the bon ton.

The whole population of Calcutta is found by a late accurate estimate, to be 177,297. Besides these, who are residents, there are about 100,000 who daily enter and depart from the city. About 15,000 of the inhabitants are nominal Christians, 45,000 Mahometans, and 118,000 Hindoos.

ADDRESS

OF THE HON. S. HAILE, DELIVERED BEFORE THE
CHESHIRE (N. H.) AGRICULTURAL SOCIETY, OCTOBER,
1822.

It was not without reluctance, my fellow citizens, that I consented to undertake the duty of addressing you on this occasion. Although the first days of my existence—the days to which I look back with most pleasure—were employed in the cultivation of the earth, yet for many years other pursuits have occupied the greatest portion of my thoughts and my time. I could not, therefore, I was sensible, communicate to you information derived from my own experience; but the reflection that you would doubtless have the candor to excuse my deficiencies, diminished my reluctance to perform the duty assigned me.

But however unacquainted I may be with the art of Agriculture, I have ever felt for the cultivators of the soil the respect which is justly due to that profession which supports all others. When therefore Agricultural Societies were first organized in New England—when the farmers instituted their peculiar and appropriate holidays, in common with others, I indulged with pleasure the expectation, that by means of these their prosperity would be increased, and the profession attain to higher estimation in society. This expectation was strengthened by a recollection of the conduct of the other professions. The clergy have their associations; the lawyers hold bar meetings; the physicians have their medical societies, and occasionally assemble to communicate to each other the discoveries and improvements they have made. If to all these professions this practice had been found advantageous, it was but natural to believe that farmers would derive equal benefit from a similar practice.

Permit me to express my sincere regret that these Societies are now regarded with less favor than formerly; and my astonishment that their warmest opposers are found among those whom they are calculated most to benefit. And what are the objections against them? It has been said that the premiums are often injudiciously and unjustly bestowed. Instances, no doubt, have occurred where the most worthy claimants have failed to obtain them. But the instances are few, and much fewer than they are supposed to be. Greater confidence ought certainly to be placed in the decisions of awarding committees who are selected for their skill and act under a sense of responsibility, than in the opinions of casual observers and disappointed competitors. But it cannot be pretended that in any instance a premium has been obtained without some degree of merit in the receiver. If granted to a degree inferior only to the highest, it has certainly answered a valuable, if not the most valuable purpose. It has rewarded industry and skill, and its effect to stimulate others to exertion is diminished in a slight degree, if diminished at all.

It is another objection, that by the offer of a premium for the fattest steer or ox, and for the most abundant crop, the farmer is enticed to bestow all his care upon one animal or upon one acre, to the neglect of all the rest. The reply to this objection is, that it is not for the fattest animal that the premium is offered, but the one having the most points of excellence; and to raise one possessing these does not require that

the others should be neglected. It requires only a good judgment, improved by careful observation of the different breeds and a due degree of care and attention. As to crops, it is by no means clear, that the neglect of a part of the land will render them less abundant. Indeed it hardly admits of doubt, that the quantity of manure usually applied to two acres would, if applied to but one, yield, in most cases, the same profit to the farmer. Any expedient, therefore, which can entice him to till fewer acres, or to make a greater quantity of manure, must be beneficial to him and to the country. It certainly is not useless wisdom to know what is the utmost power of the soil and what the utmost efficacy of manure; nor can there be danger that the farmers of this country can be very soon induced to depart too far from the very prevalent error of bestowing their labor and spreading their manure upon too large a surface.

It has often been objected that the expenses necessary to be incurred to obtain a premium are generally greater than the amount of it, and the inference is deduced that the offer of it produces more injury than benefit. The fact is seldom so; but were it often so, the inference would be incorrect and unwarranted. Does no permanent benefit result from the experiment made and the knowledge acquired? Has not the successful competitor, and not he alone, but all the competitors, ascertained some new principle which they can afterwards apply with greater skill, or discovered some new method which they can afterwards simplify and extend? Let me illustrate my meaning by a reference to the mechanic arts. Suppose a premium of one thousand dollars had been offered to the person who should invent the best machine to separate cotton from the seed. This premium although large, would not perhaps have been a sufficient recompense to the illustrious Whitney, for the machine he first contrived and completed. But in making the first, he might have ascertained what was possible to be effected; and in making the second and the third have learned how to simplify the structure in such a manner that he could afterwards erect a machine at even less expense than the cultivator of cotton could well afford to pay. Such is precisely the case in Agriculture. The farmer who has ascertained by an experiment, which the offer of a premium may have encouraged him to make, that an acre of land can be made to produce eighty or a hundred bushels of corn, may, at successive trials, arrive at the same result in a more simple manner. He may ascertain that some parts of the process may be omitted without detriment, and that others may be executed at much less expense than at first. And this will be but a small portion of the benefit that will accrue. Others besides the competitors will be induced to make a trial. Inquiry will be awakened as to the means which were used to obtain such astonishing success. A knowledge of the best mode of cultivation will be extensively diffused. The reputation and price of our lands will be raised; and fewer enterprising young men will leave the home of their fathers to bury themselves in the western wilderness. Ambition will be excited; higher aims will be entertained; a whole country will feel the invigorating influence, and advance a step forward in the progress of improvement.

It has moreover been observed, that as the poor are unable to incur the necessary expenses, the premiums are gained principally by the rich. If the poor cannot, and do not, incur the expense of making an experiment, the objection just considered loses all its force. If the rich make expensive experiments, the mode and results of which will be known to all, and will contribute to the benefit of all, it is certainly not unjust that they should receive from a fund to which they largely contribute, a partial, if not entire, remuneration. The farmer who considers himself poor ought indeed to rejoice that the rich can be induced, partly by the prospect of recompense, and partly by the love of distinction, to make experiments in Agriculture, from which, if unsuccessful, they alone will sustain injury, but from which, if successful, not only they, but he and his country will derive essential advantage.

They who make these objections take too narrow a view of the operation and effect of these societies. They look at them only in the act of awarding premiums. They suppose that their influence is felt by the competitors only, and that it ceases the moment the premium is paid. Such a view is indeed quite too narrow and circumscribed. Far more powerful and extensive is their influence. It is felt by many who are not conscious of it; and by many who regard with indifference, if not hostility, the cause of their own improvement. They rouse the attention of farmers; they elicit facts, statements and theories; they collect and spread information; they elevate the agricultural profession, by bringing the members of it together, by making them acquainted with each other, and by shewing them their collective strength. The emulation they excite animates every farmer to greater and more constant exertion. If one person raises a crop unusual large, his neighbors, ashamed to be left far behind, will be stimulated by pride as well as interest, to strive to approach as near to him as possible.

But our experience, my fellow citizen, proves the beneficial effects of these societies. The appearance of our country has greatly improved since their first institution. This remark is supported by the testimony of almost every traveller. And they who have constantly attended our cattle shows, assert that at every recent exhibition the stock offered has excelled that which was offered at the preceding one; that the young cattle have uniformly surpassed the old; and that the improvement has been plainly visible, and by no means trifling in degree. Will any one say that this effect may be attributed to some other cause? Let him then point out that cause, and by comparing with the one to which I refer it, demonstrate its superior efficacy.

Not to our own experience only would I appeal. That of England fully and powerfully corroborates ours. In that country, Agricultural Societies have been long established; and since that establishment—I repeat now the remark of accurate and critical observers—the art of husbandry has been constantly advancing and to them this advancement has been generally attributed. No example or testimony can be more respectable than that of English husbandmen who cultivate their own farms. They live in that happy medium between luxury and

erty which gives full scope to the exertion of the judgment, and summons all the faculties of the mind to active and constant exertion. In that country, too, Agriculture is not only practiced as an art, but it is also studied as a science. The farmer, as well as the clergyman or physician, has his appropriate library. He gains knowledge by reading in the closet, as well as by observation in the field. The first of the age—he to whom Bonaparte assigned the palm of excellence—has, at the request of the Board of Agriculture, devoted much of his time to making experiments calculated to render the science of which he is master, subservient to that which it is *their* official duty to encourage. The experiments were detailed in lectures delivered before the Board. These lectures have been published in a book. They have been read throughout Europe and America; and have, by intelligent Agriculturists, been pronounced highly useful and instructive. That they are the production of a man who is not a farmer, and that they have been printed and published, are not supposed to be circumstances which ought to render them unworthy of attention.

The prejudice against book-farming, as it is called—but to use a more correct expression, the prejudice against consulting and regarding the experience of others—exists no where but among the farmers of this country. If we trace it to its origin we shall find that our ancestors deserve less censure for imbibing it, than the present generation for submitting to its influence. When our country was settled, the soil was rich from the decomposition of all the vegetables which for ages had grown and decayed upon its surface. It required no skill to obtain from this soil an abundant harvest. Hard and constant labor only was requisite; and the strength of sinews was of course more highly prized by the farmer than experience and sagacity which could profit him nothing. That the agricultural books then existing in our language, were adapted to a different climate and to a country where the soil had long been subjected to the yearly exactions of the husbandman, rendered them entirely inapplicable and useless here. When consulted and followed, as they doubtless sometimes were, by emigrants from the milder climate and exhausted fields of England, they led astray those who had been accustomed to confide in them. The well-instructed, intelligent and systematic farmer was enabled to succeed no better than he who was ignorant but industrious. Hence arose an opinion that all books on the subject of husbandry were not only useless but injurious; that agriculture could derive no aid from science; that any person who was able to labor, but unfit for every other profession, was yet fit to be a farmer. And what effect could such opinions, long and generally entertained, produce, but the deep degradation of a profession, which, as it is the first in usefulness, ought to be held highest in honor?

The circumstances which gave rise to the prejudice and opinions I have mentioned exist no longer. Our good soils have, by constant culture, been exhausted of those properties which render them fertile. Nature failing, art must here, as well as in England, be pressed into our service. The rules and precepts of art

must be ascertained by experience and observation; but that they may be extensively useful, they must be published, and by this means be preserved and placed within the reach of all. Will any farmer disdain to consult these books? Will any say that in this country the art of husbandry has already reached perfection? Will any say that he is too wise to profit from the recorded experience of others? This in effect, is the language of those who proscribe the perusal of Agricultural publications; and as it is one of the objects of Agricultural Societies to obtain materials for such publications, this, in effect, is the language of those who deny the usefulness of Agricultural Societies.

Believing that these Societies, could they receive sufficient patronage to enable them to produce their full effect, would be highly beneficial to the country—would conduce to the improvement of husbandry, and add respectability to the profession of farmers, I have endeavored to refute the principal objections which have been raised against them. These objections have lately been urged with increased zeal and with pernicious effect. They have deprived our country societies of the public patronage. I cannot but hope that hereafter a different sentiment will prevail—that our intelligent farmers, discarding unfounded jealousy, will, by all the means in their power, foster institutions which reason, our own experience, and the experience of others concur in pronouncing eminently useful.

(To be concluded in our next.)

From the Albany Plough Boy.

MR. SOUTHWICK—In our neighborhood, we have made up a kind of a reading room, and take most of the Albany papers.

Our attention has lately been a good deal turned to the fate of Agricultural Societies, as we notice some sharp shooting in the papers, on that subject.

We have heard a report, as how the first Legislature under the new Constitution, will, in all probability, repeal the agricultural law.—Last evening we had a pretty full meeting, and considerable debating on the subject, something like what you call lobby members.

Squire J—s who you know talks a great deal, and sometimes he is quite eloquent, as he was once a considerable of a lawyer, took an active part. Capt. S—th was warmly opposed to these societies. He finished the remnant of his glass, and said—"I am not ashamed to own I was at first, when the fever was up, a friend to these agricultural societies;—but, says he, I've tried three times for a premium on swine, but they were given to rich farmers. My wife carried some excellent flannel at the last Fair, but, because it was not made of merino wool, the premium was given to Col. T—'s wife, who you know is a rich man too. My eldest daughter carried a pair of blue knit stockings, and our Polly made a straw hat—but all in vain—we got no premiums; and, so we are all now determined to pull down the societies if we can; for it is a confounded shame, that the state should spend TEN THOUSAND DOLLARS a year, to give rich farmers in silver plate, and we poor farmers must be taxed and ruined, to pay the piper. It is all parade and nonsense, be assured."

Smoking my pipe quietly in a corner—so says I, now I see Capt. S—th, that the patriotism of your family, all lies in your pocket.

Squire J—s, all this time, appeared absorbed in thought, with his chin resting upon a well worn round head of an old livery staff. "Well, says he, gentlemen, I have been listening to your debate, on a subject of great importance. I thought as Capt. S—th now does, when these Cattle Shows first began in this country—but I am not such a fool as to shut my eyes and ears against truth—what I see I believe, although it appears to me like magic, yet so is the fact. Now, let us, in imagination, strike a circle, for instance, of ten miles round this spot; and then let us fairly compare the general state of the farms within the circle now, to what they were only four years ago—also our live stock—and our household manufactures; the answer we all know—well, now hold on there; and then let us look at the fences—clean barn yards—brushing up on all sides—deny this if you can, Capt. S—th—don't you observe also, that our wives and daughters are brushing up, and are more cheerful than formerly, when we could hardly bring both ends to meet. For my part, I am a friend to the new Constitution, a full blood buck tail, if you will have it so; and for that reason, I shall be mortified, if the agricultural societies should be pulled down the first year of the new Constitution. Besides, said the Squire, rising upon his staff, and brightening up into eloquence—besides, gentlemen, it will be as vain to attempt to arrest the progress of these agricultural societies, as to check the descent of the Hudson River in a freshet.

"The tide of public opinion will roll on—the light of science cannot be concealed—the good sense of the community will eventually predominate—the moment the state is liberated from its canal responsibilities the cause of agriculture, Mr. H. says, must be sustained with renewed vigor and animation. So say I. Enough has been done to insure that result—the seed are widely scattered, and sown on a luxuriant soil—in the mean time they germinate and shoot forth in all their beauty and splendor.

"Posterity will be blessed by its fruits—and will not fail to revert their eyes to the present day with astonishment, should the law be repealed." Your esteemed friend,

PETER PLOUGHJOGGER.

PAUPERISM.

We have (says the Baltimore Chronicle) already, and on more occasions than one, taken the liberty to remark that the only way to abolish pauperism, is to repeal all our poor laws altogether, to cut up the whole root and branch, without any sort of favor or affection; that the malady resides in the law making provision for the poor, which when abolished will bring the evil along with it. Pauperism may be denominated vice, and indolence, put out to nurse, and is it any wonder that both should thrive under such liberal munificent patronage? We make provision for paupers with as much legislative gravity, as if it were our object to establish Colonies all over the Continent, consisting of such meritorious individuals. The sin and iniquity of this may be traced to the law—a fact that has been proved, by statistical details from the most unquestionable documents

THE FARMER.

BOSTON:—S. THURDAY, APRIL 7, 1825.

The Farmer's and Gardener's Remembrances.

APRIL.

FENCES.—As soon as possible put your fences in thorough repair. Some farmers have a knack at teaching their cattle to jump over or shove down fences. They begin with a weak fence, three rails high perhaps, or thereabouts. As soon as their cattle have learnt to leap over or throw down such a fence they add another rail, and now and then a prop or a stake, which the animals soon learn to "make nothing of." The farmer then does what he ought to have done in the first instance, makes a good *five-rail* fence. But his cattle, having by this time found out their own strength and agility, are not to be stopped by such trifles, and if they do not become quite so nimble as the "cow that leaped over the moon," and as hard to confine as Baron Trenck, they take all occasions to show how badly they were brought up, and their owner loses property as well as credit by his neglect of *early discipline*.

EARLY POTATOES.—The best time to plant potatoes for winter's use, feeding stock, &c. is said to be about the latter end of May, or the first of June; but it would be good economy, generally speaking, to plant an early sort on early ground to feed your hogs, before your Indian corn is ripe. You may thus, perhaps, get the start of your neighbors, and bring your pigs to a better because an earlier market. Plant the earliest sort for this purpose; some say the English Whites (as they are called) are best, and will do to dig in July. Every farmer, no doubt, thinks he knows how to plant potatoes without our advice. However, it can do him no harm to attend to what we have to say upon the subject, and if he pleases he may take his own way afterwards in spite of us.

As good and as expeditious a way as any for putting the seed into the ground is as follows: "After the ground is prepared, by ploughing and harrowing, cut furrows with the horse plough, forty inches apart; drop the sets in the furrows; then pass the plough along the back of each furrow, which will throw the earth of both furrows upon the sets; and afterwards level the ground with the back of a harrow, or with a harrow that has short tines if you will; but it is of no great consequence whether it be levelled at all. Another method of planting is, to plough the ground plain, keeping the furrows straight and regular, and drop sets in every third or fourth furrow."*

A writer in the *American Farmer*, vol. i, p. 151, recommends a similar process in planting, but prefers having the rows but three feet, and the seeds containing one eye, or two at the most, eight inches apart, in the rows, and each cutting or seed should weigh about the third of an ounce avoirdupois. At this rate an acre will require about 15 bushels of seed. If the ground be rich enough without manure, the furrow for the row need not be more than four inches deep, otherwise it ought to be six. In dry sandy land put the seed under the manure; if otherwise, put it on the top.

With regard to the choice of seed potatoes, their size, &c. the following remarks appear to

be correct. "Some economists begin by paring the potatoe, and planting only the skins; others less saving, cut the potatoes into slices, leaving a single eye to each slice; and a third class, almost as provident as the other two, are careful to pick out the dwarfs, and reasonable enough to expect a progeny of giants. These practices cannot be too much censured, or too soon abandoned, because directly opposed both by reason and experience. In other cases, we take great pains, and sometimes incur great expense, to obtain the best seed. In the cultivation of wheat we reject all small, premature, worm eaten, or otherwise imperfect grains; in preparing for a crop of Indian corn, we select the best ears, and even strip from these the small or ill-shaped grains at the end of the cob; so also in planting beets, carrots, parsnips and turnips, the largest and finest are selected for seed. The reason of all this is obvious. Plants, like animals, are rendered most perfect, by selecting the finest individuals of the species from which to breed. Away, then, with such miserable economy, and instead of planting skins, or slices, or dwarfs, take for seed the best and largest potatoes; those having in themselves the most aliment for the young plants; place them in your furrows ten or twelve inches apart, and cover them carefully with earth."*

The opinions of the writer above quoted coincide with facts as developed by many experiments which we have heard or read of, particularly with those made by a gentleman of Ryegate, Vt. and detailed in the *New England Farmer*, No. 7, p. 53. By these it appeared that "large potatoes are much better for seed than small ones, and that it is better to cut them than to plant them whole," and that the middle parts of potatoes used for seed will produce better crops, other things being equal, than the ends.

From an experiment made by a farmer in the employ of the Hon. Josiah Quincy, the particulars of which are given in the *Mass. Agricultural Repository*, vol. v, p. 64, it appears that the product of certain rows, planted with whole potatoes, exceeded an equal extent of adjoining rows, planted with cut potatoes *more than one third*. This is very different from the result of the experiments of the gentleman who sent us the communication from Ryegate, above referred to. We are not able to conjecture what could be the cause of this difference; but we should apprehend that some disadvantage might accrue from cutting potatoes in consequence of the juice of the potatoe being wasted through the wounds. Mr. McMahon advises to cut the potatoes "a week before planting, in order that the wounds should have time to form a dry crust, for if planted at this season immediately after being cut, they would imbibe too much moisture, many of them rot, and the rest be greatly weakened thereby." The *Farmer's Assistant* says that wetting seed potatoes, and then rolling them in Plaster of Paris, immediately before planting, greatly assists the crop.

It should seem by some experiments detailed in the *Pennsylvania Farmer*, and quoted in the *Farmer's Manual*, page 55, that large potatoes cut into sets or pieces, with two eyes each, produce more when set at nine inches distance in

the rows (being planted according to the drill method) than at six or twelve inches distance.

Coarse manure answers best for potatoes.—Fallen leaves taken from the woods are recommended by a correspondent of the *Bath Society* in England. This kind of manure, says the writer, causes potatoes to be much more meal and of a finer flavor than when they are produced by the application of ashes or dung.—There are many farms where rotten leaves, and the soil which is made by their decay, may be obtained in great quantities, and at a very trifling expense. Dry straw, damaged hay, &c. are said to be fully equal for potatoes to the best rotted dung. Indeed, on some accounts, straw hay, &c. are to be preferred as they give potatoes of the best quality, and equal in quantity to rotten manure from the dunghill. Dry straw cut with a machine, would probably be equal to any manure for potatoes.

A British writer gives the following rules relative to the management of seed potatoes, &c. which we think worthy of being submitted to our practical farmers. 1. "The potatoes for seed should be kept in a separate pit, which should never be opened, until the time when the potatoes are to be cut into sets: for if vegetation commences any time before the potatoes are to be planted, it is apt to occasion the curl. 2. The sets should be placed about a foot separate from each other. 3. Many crops are spoiled from being planted too deep in the ground. This ought carefully to be avoided."

We do not insist upon the farmer's planting his potatoes in the drill method, especially if his land be rough, stony, or hard to cultivate. In such case the old mode of planting in hill is probably preferable. But in a rich, mellow soil, the drill method is undoubtedly best. Dr. Deane observed as follows—"One of my neighbors planted in his garden, drills and rows of hills alternately of equal length, and equally manured; when he dug them he found the drill rows produced twice as much as the other. It is not more labor to lay the dung in drills than in hills; and the labor of hoeing is not increased."

* *Systems of Husbandry in Scotland*, vol. i, p. 426.† Deane's *N. E. Farmer*, p. 226; Wells & Lilly's ed.

MR. OSBORN'S POEMS.

We have this day published the proposals of Mr. Solleck Osborn, for printing, by subscription, a Collection of Poems. We have seen some specimens of that gentleman's poetry which induce us to entertain a favorable opinion of his powers as a poet. What we have perused have appeared from time to time in newspapers, and we were pleased with them. We considered them as correct, moral, and sentimental effusions, exhibiting the inspiration of the genuine Bard, divested of that wildness and eccentricity which characterize the productions of many modern British lyrists, who too frequently in search of sublimity bid adieu to common sense, and resemble more

"A wild goose lost in hazy weather,"
than a genuine bird of Jove, soaring to meet the sun in the midst of the Elysæan.

It is true we have heretofore been pitted against Mr. Osborn in political contests, but we have long since laid down the weapons of our warfare; and besides, we hope we resemble—so far as candor is concerned—the critic mentioned by Pope,

"Who to a friend his faults can freely show,
And gladly praise the merits of a foe."

We wish Mr. Osborn success, and hope the American public will take this opportunity to wipe away a stinging theme of reproach from foreigners, that nobody reads or buys an American book.

* Deane's *N. E. Farmer*, p. 347; Wells & Lilly's ed.† *Treatise on Agriculture*, first published in the Albany Argus.

FARMER SUMMARY OF NEWS.

FROM GIBRALTAR.

The brig Jew, Capt. Deane, arrived in this City on Friday last, and brought Gibraltar papers to the 15th of February. By these it appears that the Spaniards are preparing to breast the shock of battle, without exhibiting any symptoms of dismay. The Cortes have voted to raise 30,000 additional troops, increasing the army to 124,579 men, and have taken measures to fit a naval armament adequate to the defence of the straits. Gen. Mina is confined in the command of the army of Catalonia, Gen. Ballasteros is appointed to the armies of Arragon and Navarre; an army of reserve is to be assembled near Madrid to be commanded by Count Abisbal. Thanks were voted to Gen. Mina and his army by the Cortes, for having obtained command of the forts of Urgel, which were surrendered on the 3d of February. On the 20th Jan. Brig. Gen. Llorens burned to the ground Pitons, and all the country-houses within one league of it, in consequence of inhabitants being inimical to the Constitutional Government.

Gen. Donnell, Commander in Chief of the King's armies in Navarre and Biscay, has issued a proclamation to his troops, which is full of pomposity. In this, he says that "The tyrannic sway of incredulity and rebellion is forever at an end. The worthy Head of the august dynasty of the Bourbons has sent forth from Paris, the thunderbolt which is to hurl it down in ruin, where, as a last asylum, some of her unnatural sons had attempted to enthroned it," &c. &c.

LATEST FROM EUROPE.

Capt. Curtis, from London, arrived in Boston on the morning of the 2d inst. and brought papers to the 24th of January. These have a somewhat more pacific aspect than the last preceding accounts. It is now said that the departure of the Duke d'Angoulême, the Commander in Chief of the French armies, destined for the invasion of Spain, has been deferred till the end of March. He, however, may be merely to avoid a winter's campaign. The merchants of Havre have prepared a petition for peace. According to the Courier, G. Britain has determined on a "dignified neutrality." Publication, however, that is the opinion of the greater part of the population throughout Europe, is decidedly opposed to a war with Spain. Should France undertake a menacing crusade against the liberties of that country, her troops will be accompanied with the execrations of every friend to humanity throughout the civilized world; and every victory (should they obtain any) would be the source and signal of bitter lamentation to every human being who is not an enemy to the human race.

Latest from Canton.—Capt. Ashly, from Canton, brought papers and advices to the 1st December. It appears by them, that the first account of the extent of the great calamity of fire experienced there, is, as not unusual, much exaggerated. It had, however, been ascertained that 4,500 houses, &c. had been destroyed. The Chinese government had adopted measures for the relief of the sufferers, and for rebuilding the desolate suburbs.

Tremendous Snow Storm.—Almost every paper, day after day, furnishes us with something sublime under its head. It has not, however, been quite equal to an avalanche; and we have heard of no city, town or village having been buried for quite so long a time beneath a mass of snow as the bosom of the deep. It is true that on Sunday night and Monday morning last, snow or Boreas mustered his troops, "the light militia of the lower sky," and these, under the command of Gen. Frost, a very blustering character, effected a temporary non-intercourse between town and country; and then undertook to barricade the doors of many peaceable inhabitants of the good city of Boston. But Gen. Sunshine and Com. Southwind have attacked the airy castles of the tyrant of the north, and he is now in full retreat towards his head quarters at the north pole.

CHARLES VIGNOLES, Civil and Topographical Engineer, has published in N. York, a work entitled, "Observations upon the Floridas." The National Gazette says, "this work contains more abundant, precise, and well digested information concerning the Floridas than any other extant."

Lord Byron, says the Charleston Courier, is coming to this country. We are sorry for it. He will not be pleased with the United States. Neither their climate nor their manners are sensualized, as in Italy. He will find that his mind has travelled in advance of his person, and withered the flowers that he hopes for in his path. He will behold the pious, recoiling from apostate genius—the beautiful, shuddering at the profane of innocence—and the virtuous republican, sneering at the vices of peagee.

Public Dinner.—A public dinner was given on the 20th ult. to Joseph Shearer, Esq. of Pittsfield, Mass., by a number of gentlemen of that town, "as a token of their gratitude for his many acts of munificence to the town."

Fires.—On the 20th ult. the Dye House, belonging to the Pittsfield Woollen Manufacturing Company, was destroyed by fire, with most of its contents. Loss estimated at \$2000. The origin of the fire cannot be accounted for.—The Woollen Factory at Hempstead Harbor, L. I. was totally destroyed by fire on the 25th ult. with all the out buildings, stock and machinery. The loss of property is estimated at about \$15,000.

Messrs. Bliss & White, of New York, have in press a new American novel, entitled "*The Wilderness, or Braddock's Times*." Those who are acquainted with its author entertain sanguine expectations of its success. We understand (says the Commercial Advertiser) that this novel, in which the immortal Washington is introduced in the character of an *unsuccessful lover*, will be published in about ten days.

Capt. C. G. Ridgely has presented to the University of Maryland for the Museum, a collection of Minerals formed during his late visit to S. America, and which includes several of the most interesting productions of Peru and Chili, principally from their gold and silver mines. Capt. R. has also presented, with other general curiosities, a couple of specimens of Earthen Ware, found near the tombs of the Incas, which shew that considerable skill in the art of Pottery existed among the ancient Peruvians.—*Balt. American.*

PROPOSALS,

FOR PUBLISHING BY SUBSCRIPTION A COLLECTION OF

FUGITIVE POEMS,

MORAL, SENTIMENTAL AND SATIRICAL.

BY SELLECK OSBORN.

THE author of the articles which are to compose this volume, never wrote with a view to fame or profit; he merely obeyed the impulse of the moment. Of those which were sent to the press he seldom retained copies; and they were usually forgotten by him, until recalled to his mind by public prints, which have often gratified him by flattering notice, but which have also frequently annoyed him by mutilations which were extremely mortifying. This last circumstance (besides private solicitations and other motives) has induced him to collect, with considerable pains, his scattered effusions, and to add some unpublished pieces; which altogether will have at least the merit of being genuine; and perhaps that of inculcating to the best of the author's capacity, good principles and amiable sentiments—excluding all matters relative to party politics. Disinterestedness is not pretended: It is confessed that a liberal patronage would be very acceptable, on various accounts. The author confides in the tried zeal of his friends throughout the Union, for the promotion of his interest in this case.

The volume will be neatly printed, in a duodecimo form of 200 pages, on handsome paper, with type entirely new, and well bound in boards, at one dollar, payable on delivery.

A commission of 12 per cent will be allowed to agents on all returns made.

Gentlemen holding subscription papers will please return them by the first of June next, or as soon as reasonable efforts have been made to obtain subscribers.

Editors of newspapers will oblige the author by republishing or noticing these proposals, and receiving subscriptions.

Communications to be addressed to the author at Merchants' Hall, Boston, Mass. April 5.

NEW GARDEN SEEDS.

FOR sale, by GEO. MURDOCK, No. 14, Market Square, a great variety of English and American GARDEN SEEDS, of the last year's growth; consisting of early Frame, Hotspur and Charlton Peas; early and late Cabbages; early and late Cauliflower; Sweet Marjoram, Thyme, &c. with every other seed suitable for a kitchen Garden. Also, 40 lbs. Mangel Wurtzel or Scurdy—100 lbs. Ruta Baga or Swedish Turnip—a quantity of Arum and Carrot. March 29.—6w

SAFFORD'S STRAW CUTTER.

THE utility of cutting Hay, Straw, and other substances for feeding cattle, is now so universally acknowledged that any remarks on the subject must be deemed superfluous. The following Certificate will therefore be conclusive of the merits of the above mentioned Machine.

Boston, March 22, 1823.

We, the subscribers, have in operation a Straw Cutting Machine invented and exhibited in this city by Noah Safford, and we do not hesitate to say that in our opinion it exceeds any other we have ever seen, for cheapness, simplicity, despatch and durability.

STEPHEN HARTWELL, SPURR & HOLMES.
HEZEKIAH EARL, ANDREW SLATER.

The above mentioned Machines may be had of J. R. NEWELL, at the Agricultural Establishment, No. 20, Merchant's Row, Boston. Price \$15.

CONTENTED FARMER.

Give me the lot of one who moves
Contented in a humble sphere,
Who gains respect from all he loves,
And dreads no lurking envy near.
For such a man each rolling year,
Brings round a double share of joy;
His mind, of stormy passions clear,
Befits his innocent employ.
Though fortune smiles upon a throne,
Contentment smiles on him alone.

He cultivates his native soil,
In plain but comely dress attir'd;
The social pipe beguiles that toil
Which has with strength his limbs inspir'd.
Great Cincinnatus oft retir'd,
To live on his paternal field,
(When war's last trumpet sound expir'd)
And felt more joy than victories yield.
A little spot was all his gain—
A People's love his large domain.

[Providence Paper.]

AURORA BOREALIS, OR NORTHERN LIGHT.

In the north-eastern parts of Siberia, the northern lights are observed to begin with single bright pillars, rising in the north, and almost at the same time in the north-east, which gradually increasing comprehend a large space of the heavens, rush about from place to place with incredible velocity, and finally almost cover the whole sky up to the zenith, and produce an appearance as if a vast tent was expanded in the heavens, glittering with gold, rubies and sapphire. A more beautiful spectacle cannot be imagined; but whoever should see such a northern light for the first time, could not behold it without terror. For however fine the illumination may be, it is attended with such a hissing, crackling, and rushing noise through the air, as if the largest fire works were playing off. The hunters who pursue the white foxes on the icy sea are often overtaken in their course by these northern lights. Their dogs are then so much frightened that they will not move, but lie obstinately on the ground till the noise has passed.

Similar lights, called *aurora australes*, have been observed in the southern hemisphere.—They differ, however, from those in the north, in being always of a whitish color, whereas those of our hemisphere assume various hues, but are generally of a fiery or purple color.

In the Shetland Isles, these lights are called the *merry dancers*, and serve to enliven the long winter nights. There they often cover the whole hemisphere, and make a very brilliant appearance. Their motions are then very rapid, and their forms very various. They break out in places where none were seen before, skimming briskly along the heavens, and are suddenly extinguished, leaving behind them a uniform dusky track. This is again illuminated in the same manner, and as suddenly left a dull blank. In certain nights, they assume the appearance of vast columns, on one side of the deepest yellow, on the other declining away till it becomes undistinguished from the sky. They have generally a strong tremulous motion from the end, which continues till the whole vanishes. In a word, we, who only see the extremities of these northern phenomena, have but a faint idea of their grandeur, or their motions.

According to the state of the atmosphere, they differ in color; they often put on that of blood, and make an awful appearance.

The periods of the appearance of these northern lights are very variable. In some years they occur frequently, and in others are more rare; and it has been observed that they are most common about the time of the equinoxes.

There have been many speculations and conjectures respecting the cause of the Aurora Borealis. It is now generally supposed that northern lights as well as aerial meteors are caused by that universal and all powerful agent electricity. A writer in the *Encyclopedia Britannica* gives the following solution of the manner in which he supposes the electric fluid operates to produce these and other phenomena. He assumes three axioms, viz: that all electric bodies, when considerably heated, become conductors of electricity; that, non-electrics, when subjected to violent degrees of cold, become electric; and that cold increases the electric powers of such substances as are already electric. From these premises he proceeds to deduce the causes of the aurora borealis as follows:—

“The air all round the globe at a certain height above its surface, is found to be exceedingly cold, and as far as experiments have yet determined, exceedingly electric also. The inferior parts of the atmosphere between the tropics, are violently heated during the day time by the reflection of the sun's rays from the earth. Such air will therefore be a kind of conductor, and much more readily part with its electricity to the clouds and vapors floating in it, than the colder air towards the north and south poles. Hence the prodigious appearances of electricity in these regions, shewing themselves in thunder and other tempests of the most terrible kind. In the temperate and frigid zones, the inferior parts of the atmosphere never being so strongly heated, do not part with their electricity so easily as in the torrid zone, and consequently do not require such recruits from the upper regions; but notwithstanding the difference of heat observed in different parts of the earth near the surface, it is very probable that at considerable heights, the degrees of cold are nearly equal all round it. Were there a like equality in the heat of the under part, there could never be any considerable loss of equilibrium in the electricity of the atmosphere; but as the hot air of the torrid zone is perpetually bringing down vast quantities of electric matter from the cold air that lies directly above it; and as the inferior parts of the atmosphere lying toward the north and south poles do not conduct in any great degree; it thence follows that the upper parts of the atmosphere, lying over the torrid zone will continually require a supply from the northern and southern regions. This easily shows the necessity of an electric current in the upper parts of the atmosphere from each pole towards the equator; and thus we are also furnished with a reason why the aurora borealis appears more frequently in winter than in summer; namely, because at that time the electric power of the inferior atmosphere is greater on account of the cold than in summer; and consequently the abundant electricity of the upper regions must go almost wholly off to the equatorial parts, it being impossible for it to get down to the earth.

Mr. Kirwan supposes that the rarefaction of the atmosphere in the polar regions proceed from the northern and southern lights, and the lights are produced by a combustion of inflammable air, which is kindled by electricity. If inflammable air is generated, particularly between the tropics, by many natural operations such as the putrefaction of animal and vegetal substances, volcanoes, &c. and being lighter than any other, occupies of course the highest regions of the atmosphere. Mr. Kirwan farther adds, that after the appearance of an aurora borealis, the barometer generally falls, and is commonly followed by high winds, proceeding from the south; all which facts strongly prove a rarefaction in the northern regions.

It is observed by Mr. Winn (*Phil. Trans.* v. 73.) that the appearance of an aurora borealis is a certain sign of a hard gale of wind from the south or south west. This occurred without fail, in twenty-three instances; and he thinks that the splendor of the northern light will enable the observer to form some judgment concerning the ensuing tempest. If the aurora is bright, the gale will come on within twenty-four hours, but will be of short duration; if the light is faint and dull, the gale will be less violent, and longer in coming on, but will last longer.

Dr. Franklin in some of his philosophical says accounts for the aurora borealis on principles of electricity. He premises the following electric phenomena. 1. That all new fallen snow has much positive electricity standing on its surface. 2. That about twelve degrees latitude round the poles are covered with crust of eternal ice, which is impervious to electric fluid. 3. That the dense part of the atmosphere rises but a few miles high, and that in the rarer parts of it the electric fluid will pass to almost any distance. Hence he supposes there must be a great accumulation of positive electric matter on the fresh fallen snow in the polar regions; which, not being able to pass through the crust of ice into the earth, must rise into the thin air of the upper parts of the atmosphere, which will the least resist its passage; and passing towards the equator descend again into the dense atmosphere, and there into the earth in silent and invisible stream. This theory of Dr. Franklin is essentially the same with that of the writer in the *Encyclopedia Britannica* above quoted.

(TO BE CONTINUED.)

Admiral Lord Howe, when a captain, was once hastily awakened in the middle of the night by the lieutenant of the watch, who informed him, with great agitation, that the ship was on fire near the magazine. “If that be the case” said he, rising leisurely to put on his clothes, “we shall soon hear another report of the matter.” The lieutenant flew back to the scene of danger, and almost instantly returned, exclaimed, “You need not, sir, be afraid, the fire is extinguished.” “Afraid!” exclaimed Howe, “what do you mean by that sir? I never was afraid in my life;” and looking the lieutenant full in the face, he added, “Pray, how does a man feel, sir, when he is afraid? I need not ask how he looks.”

BOSTON, SATURDAY, APRIL 12, 1823.

No. 37.

PREMIUMS

Offered by the Essex Agricultural Society, in 1823.

The Committee of the Trustees appointed to propose objects for premiums, advertising to the original design of the institution—the improvement of the general husbandry of the county—have thought it advisable, at this time, to depart materially from what seems to have been a leading principle in all the Agricultural Societies of the country—that of offering premiums chiefly for certain specific articles of husbandry, instead of the combined improvements of entire farms.

Since the formation of the Essex Society, specific premiums have produced valuable effects; by demonstrating, that with high manuring, and good culture, some former usual crops may be doubled, trebled, and even quadrupled. But the important question is—not what small lots in or near market towns, and abundantly supplied with manures, may be made to yield; but how the productive powers of farms can be essentially increased: and this can be effected only by a better management in all articles of husbandry. With this in view, the Committee propose to extend the encouragement heretofore given for general improvements; and offer the following premiums.

I.—MANAGEMENT OF A FARM.

For the management of a farm, in its tillage, mowing, orcharding and pasturage: the quantity of land appropriated to each—their cultivation—the means and the manner of making, increasing, preserving and applying manures—their quantities—the respective crops and products—the quantity and management of the live stock—and the quantity of labor employed—to be detailed.

For the best	- - - - -	\$30
For the second best	- - - - -	25
For the third best	- - - - -	20
For the fourth best	- - - - -	15

II.—DAIRY STOCK-SOILING.

For experiments in feeding milch cows on green crops, from the middle of June to the middle of October, by supplying them to the full with those crops, in their stables, without turning them to pasture. Feeding cattle in this manner is called *soiling*.

For the best,	- - - - -	\$20
For the second best,	- - - - -	15
For the third best,	- - - - -	10

The whole process to be detailed.

REMARKS.

The green crops may be rye (sown the preceding year) oats, barley, millet, Indian corn, clover and various grasses. Any sorts of grain, sown to produce fodder for soiling, after being harrowed in, should be rolled, to make the surface and the ground smooth for mowing. The clover and upland meadow grounds, destined for soiling, will be better for rolling, with a heavy roller, to make a smooth bottom, without which the mowing cannot be close; and it not close shaven, the thickest part of the grass will remain uncut.

If the soil be rich and the surface smooth, the grass may be cut when only three or four inches high, and will then yield a good swarth.

Such ground well set with the grasses which produce what is known among us as English hay, and inclined to moisture, may in this manner be mown three or four times in a season. The cutting of the rye, oats, barley and millet should commence as soon as they will yield a good swarth, and be finished before they have passed the flowering state. If mown before they flower, they will shoot again; and if the growth be rich, yield second crops.

Indian corn will be well grown for soiling by the 10th or 15th of July; and will continue green, and in full sap until the last of August. And in order to continue a supply of this rich green food—to which probably no other vegetable of our country is equal, especially for milch cows—pieces of land may be planted in succession, so that some may be in full sap to the last of September, when, in Essex, frosts usually strike the blades, and greatly lessen their value.

If there be a piece of rich mowing land in the farm, its second or third crop will furnish green fodder to the middle or last of October. Perhaps late sown oats, hardier plants than Indian corn, may supply the place of grass. Pumpkins, also, during this month and the next, will furnish a most valuable food.

All the sorts of fodder above mentioned, like the young grasses of the spring, naturally dispose cattle to a degree of looseness, though probably without injuring them. But if any of them operate to an excess, a little good hay will furnish a useful corrective.

After November, potatoes, mangel wurtzel and carrots, added plentifully to their dry fodder, even if this be only barley, or oat straw, or wet or low ground meadow hay, will doubtless keep cows in milch till within a few weeks of their calving.* Cows, during the time of their going dry, and other stock at all times, fully supplied with ruta бага, or common turnips, with the same poor dry fodder, may be kept in high condition. In England, cattle intended for beef are often fattened on wheat straw and turnips, giving of the latter as many as they will eat. They commence feeding in this manner in autumn, and by the spring the cattle are fat for the market. The cattle thus fattened, and in so short a time, are of moderate sizes.

Rye, oats, barley and millet, when destined for soiling, should be sown twice as thick as when intended to ripen their seeds. In like manner, Indian corn may be planted in continued rows only so far apart as to admit a small plough in its culture, and with the plants only four or five inches apart in the rows. The surface of the ground should be smooth in the rows, so as to admit of mowing the corn.

The farmer who shall pasture some of his cows, and soil the others, will add to the value

* An observing farmer, long ago expressed to me the opinion, that cows should go dry five or six weeks before calving, to give time for the milk vessels to be distended, and the bag enlarged; in the language of farmers, for the springing of the bag. It was his opinion that the greater increase of milk after calving, would amply compensate the loss of going dry so long.

of the experiment, by keeping their milch separate, and noting their relative quantities from cows of equal goodness, and the quantity and quality of the butter made from each set.

III.—THE DAIRY.

For the greatest quantity of good butter, in proportion to the number of cows producing it, (not fewer than four) made on any farm, from the 20th of May to the 20th of November, twenty-six weeks, and the quantity of butter averaging not less than seven pounds per week for each cow,

For the second greatest,	- - - - -	\$20
For the third greatest,	- - - - -	15

The kinds of food and the management of it to be detailed.

REMARKS.

The object of Agricultural institutions, as already observed, is *improvement*; and in Essex, none seems to be more wanted than in *milch cows*. If the society were to continue their premiums, during any length of time, merely for the greatest quantity of butter, they would not enforce any improvement in the quality of those animals. Seven pounds of butter a week, for each cow, is less than half what the Oakes cow of Danvers produced, in the same time. The seven pounds a week, therefore, are very attainable by every farmer who will improve his breed of cows, and feed them to the full with juicy and highly nourishing food. The Committee trust they do not entertain a groundless hope, that the premiums here offered will have claimants; and that in some future years, the Trustees will be justified in confining these premiums to cows yielding ten, twelve, and fourteen pounds of butter a week, for twenty six weeks in the year.

IV.—TURNING IN GREEN CROPS AS A MANURE.

For the best experiment of turning in green crops as a manure, on not less than one acre,	- - - - -	\$15
For the second best,	- - - - -	10
For the third best,	- - - - -	5

REMARKS.

The claimants must give a particular account of their respective processes, and the results. The object aimed at is, to ascertain whether land can be manifestly improved by turning under green crops, and to what degree enriched. Each experimenter will follow his own judgment in his process; but the following intimations may merit his attention.

The turning in of green crops is a very ancient, though not a very general practice. Its utility has lately been called in question. Hence the desire to bring it to the test of fair experiment.

Take an acre of land, so far exhausted at the last crop as to render it inexpedient to introduce another without a good manuring. Plough it in the spring, and sow it with oats, barley, buck wheat, or millet—and not be sparing of the seed. When the crop shall be full grown, but still in blossom, plough it in, and sow it again. When this second crop shall be full grown, plough it in. The next year repeat this process—again ploughing in two crops; the last by the beginning of October. It may

then be sown with winter rye, to produce a crop of grain at the next harvest—sowing five or six pecks, because sown so late.—Or it may lie till the ensuing May, and then be planted with Indian corn. The product, compared with the last of the same acre, prior to the commencement of the experiment, especially if a crop of the same kind, will show the value of the green crop ploughed in.

ANOTHER MODE.

The acre being divided lengthways into two equal parts, plough the whole uniformly in the spring. Sow on one part two bushels of oats or barley, or a bushel of buck-wheat, or three or four half pecks of millet; and harrow the whole acre alike, and so as duly to cover the seed which has been sown. When the crop has attained its full growth, but is still in blossom, plough it in; ploughing the vacant half acre at the same time, and to the same depth. Sow the first half acre again immediately, and harrow in the seed, harrowing the other half in the same manner. The next year repeat the same process. Then the whole acre may be sown with winter rye (3 pecks on each half;) or the land may lie (as in the process first proposed) to be planted with Indian corn the ensuing spring. In the third year, the crop put in must stand to ripen. The produce of each half acre (both being sown or planted, and cultivated in the same manner) must be kept by itself, and accurately measured. The difference between them will show the value of the green crops ploughed in.

Every experimenter will perceive that no manure whatever is to be used—the crops sown, and the weeds ploughed under, excepted.

Until ploughs constructed for the purpose of completely turning in green crops shall be introduced, it will be necessary to roll flat the green crop before ploughing, or it cannot be duly covered. Perhaps a small roller, or what is called a *foot*, only of a large size, may be attached to the fore end of the plough beam, to press down the crop to the ground, and thus cause it to be effectually covered. Such a roller, or foot, will serve as a gauge for the depth of the furrow in which the crop shall be buried.

V.—CIDER.

For the best cider, the pure juice of the apple, which shall be made in the present year, not less than eight barrels, - - - - - \$10
For the second best, - - - - - 5

The greater part of the cider may be sold, if the owner please, only reserving one cask, of which a sample is to be produced at the Society's public exhibition in 1824; with good evidence that the casks sold were equal to that reserved. If sold, the claimant will state when, to whom, and at what prices; and describe his whole process in collecting, sorting and keeping the apples, in making the cider, conducting the fermentation and fining, if any artificial fining be used, and in preserving the cider in the cask.

For some information of an eligible process in making and managing cider, the Committee refer to the intimations contained in the Explanatory Observations subjoined to the list of premiums for 1821.

VI.—FOREST TREES.

The same premiums that were offered in 1821 and 1822; to which intended claimants are referred. And they are desired to give

notice of their proposed claims to the Secretary, John W. Proctor, Esq. in Danvers, before the first of July next.

VII.—POTATOES.

Numerous experiments have been made, to increase the products of this root, and premiums have been awarded for the greatest; but no measures for improving their *qualities* have fallen under the observation of the Committee. It is well known that the seeds in the *apples* or *green balls*, which grow on the tops of potatoe stalks, will produce potatoes, which, planted for one year, and their produce a second year, will yield well sized potatoes. It is from these small seeds that all the varieties of potatoes have been produced. It was in this way that a distinguished farmer in Ireland—a country so famous for the culture of potatoes—obtained excellent kinds. From the numerous seeds in every ball, a variety of potatoes may be expected; some early, some late in ripening—some yielding small, and others abundant products—some watery, and others mealy and well flavored.

Expectations have often been formed of raising potatoes of the best qualities, by planting those brought from the British Isles; but disappointment is the common result: the products of the first year have scarcely borne a resemblance to the fine originals. It is very possible, and not improbable, that some sorts superior to any in cultivation among us, may be obtained from the small seeds found in the green balls. To encourage the necessary experiments, the following premiums are offered:

For the best and most valuable potatoes, taking them for all in all, raised from the seed of the apples or green balls, samples of which shall be produced at the Society's public exhibition in 1825, - - - - - \$10
For the second best, - - - - - 7
For the third best, - - - - - 5

The claimants are to detail their whole processes, and state the results.

REMARKS.

Some sorts may be of superior excellence for their meanness and flavor, but moderate in their product; some not so well flavored, may be very abundant in quantity, and highly valuable for feeding live stock; some very early ripe; some growing compactly, and so expeditiously harvested. The sorts which, combining most of these good qualities, shall be judged the most valuable, will be preferably entitled to the premiums, without excluding claims for potatoes of highly superior goodness, although less productive. To facilitate the execution of these novel experiments, the Committee offer the following

DIRECTIONS.

The experimenter, having determined with what sorts of potatoes he will make his trials, will gather the balls when the stalks, by their drying, indicate a ripeness in the seeds; and if they are not quite soft, so that the seeds will easily separate from the pulp, they may be laid by (out of the way of frost) until the pulp becomes soft. Then mash them with the hand, and with the aid of water separate and wash the seeds clean. These, being dried, may be preserved like garden seeds, until the ensuing spring. Then sow them in rows, in a bed of rich garden earth, just as small garden seeds are sown. The rows may be ten inches apart; and the plants, when grown enough to be thinned, may stand four or five inches asunder. Keep them clear of weeds, and stir the earth

between the rows. The supernumerary plants, arising from the thinnings, may be transplanted, if needed, to another bed.

In Autumn, or when the stalks become so far dried that the roots cease to grow, dig these up carefully, so that the potatoes growing on the same plant may be saved by themselves; for it may happen that each distinct plant may produce a sort different from the rest. The bulbs, or roots, of the first year, will be very small. In the next spring choosing a piece of rich ground, plant each sort in a hill by itself. The product of this year will furnish bulbs big enough to be boiled. And this will be the time for selecting the best. Many sorts may not deserve any further attention; but some may be of excellent qualities, as to time of ripening, texture, flavor and productiveness. Their several qualities should be carefully noted; and again be separately preserved and planted another year; when they will probably have attained all the perfection of which their natures admit.

Lancashire, a western county of England, as well as Ireland, is distinguished for producing good potatoes. Ireland is remarkable for the moisture of its climate; and the western is more moist than the eastern coast of England. Both are many degrees farther north than Massachusetts; and are exempt from the burning heats and droughts of our summers. These circumstances suggest the propriety of our planting potatoes on moist and cool grounds; thus assimilated, in some measure, to the soils of Ireland and Lancashire.

VIII.—PLOUGHS AND PLOUGHING.

Some ploughs are of easier draught, and make better work, than others; and some oxen draw or plough extremely well without a driver. The design of ploughing matches is to attain all possible perfection in both. The premiums, therefore, under this head, will be confined to efficient ploughs of easiest draught, drawn each by one yoke of oxen without a driver, ploughing one quarter of an acre, and turning the best furrow, at least five inches deep, and in the shortest time compatible with a continuance of the labor to complete the ploughing of an acre, if that were required.

For the best plough, team and work, - - - \$15
For the second best, - - - - - 12
For the third best, - - - - - 8

IX.—SUMAC.

The premium for this article is continued of course, as the claim is to be presented the ensuing autumn.

GENERAL REMARK.

The Committee repeat—and desire it may be remembered—that premiums claimed are not to be awarded, unless the subjects of the claims are decidedly meritorious. That is, the respective experiments must be so conducted as to exhibit results worthy of encouragement and imitation—or decisive of a question of which the solution is sought.

Where a premium has heretofore been awarded to any person, he is not to receive another for the same object. And where any plough has obtained a premium, another is not to be awarded for the same plough, nor for one of the same mould. Some important improvement can alone justify an appropriation of the Society's funds, in cases of this nature.

To allow time for enterprising farmers to

make preparations for becoming competitors for the premiums now offered, the Committee are of opinion that there should be no public exhibition in the present year. The disposable funds of the Society will thereby be increased, to reward successful candidates for premiums the year following. But whether there shall or shall not, be a public exhibition in the present year, the Society, at their approaching annual meeting, will determine. As, however, some claims were to be made in the present year, these may be sent to the Secretary of the Society, to be laid before the Trustees, for their decision thereon.

The Committee propose no premiums for the greatest quantity of any kind of crops. The experiments already made have demonstrated that is practicable; and if those known examples of success are insufficient to stimulate general exertions, the usual premiums must prove ineffectual.

Essex not being a county for grazing and fattening cattle much beyond the farmer's own wants, this article also is discontinued in the list of premiums.

As to the usual live-stock—working oxen, milch cows, young cattle, sheep and swine—they are to be considered as comprehended in the Management of a Farm, additionally to the provisions under the heads No. III, & No. VIII, relating to the Dairy and Ploughing Matches; and to the following article.

X.—FOR IMPROVING OUR NATIVE BREED OF NEAT CATTLE.

The first most celebrated breeder of live stock, in England, was the late Robert Bakewell; to whom, Mr. Arthur Young says, that country is indebted for *just principles of breeding*. And another eminent breeder says, that “before Mr. Bakewell's days, we had no criterion but size; nothing would please but elephants and giants.” And he declares that Bakewell enabled those who followed his ideas to produce two pounds of mutton, where only one was produced before.” The following were the points to which Bakewell specially attended:—“fine limbs, small bones, and a true disposition to take ready fat: which indeed is inseparable from small bones, or rather fine bones and fine limbs, or true symmetry of the parts.”

But Bakewell's prime object, in improving cattle and sheep, was to render his animals most profitable in *beef and mutton*. And he succeeded in obtaining forms indicating strength of constitution—a disposition to fatten, and at an early age—weightiness in the most valuable parts—lightness of offals. If there was deficiency in any point, he would cross his animal with one that was amply supplied in that part; and if any point of his animal was too heavy, by an opposite cross he would reduce the superfluity. In such management, diligently pursued, he at length gave to his stock the shape and qualities desired.

So far as we breed domestic animals in this county—and the observation will apply to our whole state, and generally to all New England—we must extend our views beyond *beef and mutton*; and with the former combine *milk, butter and cheese*, and a fitness for *labor*; and together with *mutton* aim at the greatest quantity of the most useful *wool*.

If Bakewell could alter the shape of his cattle, and lay flesh and fat on the most valuable

joints—as was the fact—can it be doubted that, by similar attention, the quantity and quality of the milk of our cows may be increased and enriched? But to obtain this improvement, calves should be raised from such cows only as excel in these two particulars.

It seems to be the best opinion, that of the different breeds of live stock, those of the largest size are not the most profitable. The breed of cattle, however, should be such as to produce oxen a single pair of which, at their full growth, should have strength sufficient, on proper tillage land, with well formed ploughs, to open a furrow to the depth of five, or even of six inches. As to the form of the different kinds of live stock, an eminent naturalist and farmer in England has thus expressed his opinion:—“The more deep and capacious the chest, and the shorter and lower any animal is, relative to its weight, the better adapted it will be to live and fatten on little food, the more labor it will go through; and I have always found the most short-legged oxen to be the best laborers.”

The foregoing rules of breeding, and description of good live stock, being the result of the experience of eminent English farmers and breeders, merit the particular attention of all who shall attempt to improve upon our present races of domestic animals; and are here introduced to furnish them with useful information. And in the hope and expectation that such improvements will be undertaken, the following premiums are offered:

To the person who shall produce at the public exhibition of the Society, in the year 1823, any number of milch cows, not less than four, of our native breeds, showing manifest improvements therein, by an important increase in the quantity, and maintaining, at least, if not improving, the good quality of milk—the latter to be tested by the quantities of butter made in the six months next preceding the exhibition—

For the best,	\$30
For the next best,	25
For the third best,	20

For the best pair of working oxen, or well trained steers, improved on the principles above stated, and exhibited at the same time—

For the best pair,	\$20
For the second best,	15
For the third best,	10

It will readily be admitted that our live stock demand great improvements; and no one will question whether such improvements are practicable. They ought then to be attempted. It will avail little to bestow premiums merely for the best that shall be produced; for such premiums might be given for a century, without effecting any real improvements; and thus, as to live stock, defeat the object for which the Society was formed. The known excellency of some oxen and cows, of our native breed, give assurance to judicious and enterprising farmers, that their numbers may be multiplied by observing the well-tried rules of breeding. The Oakes cow has probably not been surpassed in any country. By some she was judged to be under the size of our common cows. Her short legs probably gave rise to that opinion. There are, however, many larger cows in the county.

The best bulls and cows do not always produce a progeny equal to the parents; but ex-

perience has shown, that from such only, the highest improvements may be expected. The same observation applies to all other kinds of live stock.

Farmers who shall effect great improvements in live stock, while they render a lasting benefit to their country, will lay a foundation for advancing their own interest, in the demand, and consequently increased prices, of their improved breeds.

Reflecting farmers, who shall become candidates for premiums, will be aware, that if their exertions should not obtain the honor of a prize, they will not pass unrewarded; as all the improvements they make will either give them immediate profits, or add to the value of their farms. The direct object of premiums is not to excite merely trials of skill, but to add to the solid interests of farming; and he, who shall show how we may add most to that solid interest, will obtain the highest prize.

In behalf and by order of the Committee,

T. PICKERING.

Salem, January 22, 1823.

Pope, who, whatever his good qualities might be, certainly was not much troubled with good nature, was one evening at Burton's Colledge-house, when he and a set of literati were poring over a manuscript of the Greek comic poet Aristophanes, in which they found a passage they could not comprehend. As they talked pretty loudly, a young man who stood by the fire, heard their conference, and begged that he might be permitted to look at the passage. “Oh!” said Pope, sarcastically, “by all means, pray let the young gentleman look at it.” On which he took up the book, and considering a while, said, that there only wanted a note of interrogation to render the whole intelligible, which was really the case. “And pray master,” said Pope, piqued perhaps at being outdone, “what is a note of interrogation?” “A note of interrogation,” replied the youth, with a look of the utmost contempt, “is a little crooked thing that asks questions!” ‘Tis said, however, that Pope was so delighted with this witicism, that he forgave the sarcasm on his person.

A sportsman, by touching his horse near the withers with his whip, taught him to kneel immediately: when shooting, and a dog came to a point, he made the horse kneel, and persuaded those present that the horse was an excellent pointer. A gentleman having purchased the gelding, was fording a driver with him, when, having touched his withers, he was true to the touch, down he dropped in the stream, and soured his new master in the water. The latter in a great passion, asked his former owner what he meant by selling him a horse that played him such a trick in the water? “Oh!” said the other, “you bought him as a pointer, and at the time he went on his knees he was pointing at a salmon.”

The Reserve.—A gentleman showing his friend his curiosities, &c. in his gallery, on the other's praising them all very much, he gave him a choice of any one of them as a present. The stranger fixed his election on a tablet, in which the ten commandments were written in letters of gold. “You must excuse me there, replied the gentleman, those I am bound to keep.”

ADDRESS

OF THE HON. S. HALL, DELIVERED BEFORE THE
CHESHIRE (N. H.) AGRICULTURAL SOCIETY, OCTO-
BER, 1822.

Concluded from our last, p. 285.

I have said that our good soils have been exhausted of those properties which rendered them fertile. Reason, therefore, teaches, that the art and industry of man should, in the first place, be directed towards replenishing them with similar properties. This is done by means of manure, and to acquire a knowledge of the best modes of making, preserving, and using it, should be the principal study of the farmer. The degree of attention applied to this branch of husbandry distinguishes the judicious from the ignorant and unskilful agriculturist; and in this, care and skill are more requisite, and are more certainly and bountifully rewarded than in any other. No farmer should be satisfied with the quantity of manure necessarily made by his stock of cattle. It is in his power to obtain double that quantity; and he may rest assured that, for the trouble of obtaining it, he will be amply remunerated. If he have ordinary advantages, he may obtain that which will be fully worth one dollar per load, at an expense, which, every thing calculated, shall not exceed half that sum.

If the farmers of this country would but peruse the Agricultural publications of Great Britain, they would be astonished at the amount of time and expense which is there devoted to this branch of husbandry. They would see long and minute directions for preparing barn yards in the manner best fitted to make and preserve manure. They would see instructions given for making compost heaps in the fields and by the side of swamps, many of which cost one, and some even two thousand dollars each. They would learn in what manner the hog pen and poultry yard are made subservient to the same purpose. They would learn to their astonishment that after the usual supply is obtained from all these sources, it is not unusual for the farmer who cultivates three hundred acres, to expend three or four thousand dollars in procuring and purchasing marle, ashes, lime, &c. to be applied upon his farm. In that country, no land is cultivated without manure bountifully applied—and with manure almost any land is made fertile and profitable.

I do not refer to the customs of the English farmer for the purpose of recommending them to your strict imitation. In many points of view, his situation is different from yours. The United States contain too little surplus capital, and the demand for the productions of the soil is not sufficient, to authorise such extraordinary expenditures. I refer to them to shew you in how high estimation is held the article of manure among farmers distinguished for their sagacity. When your attention is once fixed, and your curiosity stimulated, you will, I have no doubt, select and adopt such of the modes of making it as are best adapted to your circumstances. Servile imitation is ever to be avoided. It is perhaps more injurious in Agricultural than in any other pursuit; for no two farms nor two seasons can be precisely alike. Every farmer ought to rely mainly upon his own judgment, but to render his judgment worthy to be relied upon, it should be improved by reading, inquiry, and observation.

The cheapest and most simple mode of increasing the quantity of manure ordinarily made in the barn yard is, perhaps, to carry into it mud from the swamps, ponds, and ditches, and turf from the side of old fences, and from the road side. In this manner excellent manure may be obtained at little expense. The mud from swamps and ponds consists principally of decomposed vegetables. It is entirely inert and insufficient until it has been made to ferment by exposing it to a certain degree of heat, or by mixing it with the putrescent substances which abound in the yard. It is then nearly as valuable as that which is thrown from the stable, and especially if so placed as to absorb the liquid manure which would otherwise be lost.

The best mode of preserving the strength of manure is an object worthy of more attention than it has usually received in this country. It cannot be doubted that much of it descends with the rain into the earth, and that much evaporates into the atmosphere. To prevent both, the utmost care should be taken. To guard against the former, the farmers of Flanders, who surpass even the English in attention to this branch of husbandry, pave their yards, which are made hollow in the centre, with a composition of clay and gravel. To guard against the loss of strength by evaporation, they sometimes, placing their manure in heaps, cover it carefully with a coat of loam, which becomes itself manure; and sometimes erect sheds over it to protect it from the rays of the sun. These modes are suggested for your consideration. But I cannot forbear to remark, that the practice of permitting small heaps to remain for a long time in the field, is an obvious proof of careless and unskilful husbandry.

The state in which barn yard manure should be applied to the land is a question which has lately been considerably agitated. It is the opinion of some that it should be kept over one season, and not be used until it has arrived at an advanced stage of decomposition. It is the opinion of others, that it ought to be applied in its green state; or in other words, that the whole of it, every spring, should be removed from the yard and used on the land. It appears to me that the latter opinion has the strongest reasons in its favor. The quantity would then be much greater. The fumes that escape in the process of putrefaction and decomposition, which are highly efficacious in promoting vegetation, would not then be lost. It would suffer no injury from drenching rains nor from a burning sun. The crops, soon or late, would feel all its influence. The effects the first year might not be so perceptible, but they would continue longer. This opinion is supported by the authority of late eminent writers on the subject of Agriculture. Whether it has the sanction of long and extensive experience I am not able to say. It certainly deserves the attention of those who are not opposed to all innovations and improvements in Agriculture.

The swamps which abound in many parts of our country, are generally considered of but little value. Many of them, however, are capable of being made the most productive land. For many centuries, the rains have carried into them the soil from the uplands. The winds have borne thither the leaves of trees. Numerous plants, luxuriantly growing, and yearly decaying, have added to the depth and richness

of the soil. To these swamps I wish to direct the attention of farmers. Whenever it is found possible to drain them, the natural outlet should be deepened, or a ditch should be dug through the bank where the descent is greater. It is essential that the bottom of this ditch should be at least three feet lower than the surface of the swamp. Its width, especially if the swamp contain many acres, should not be less at top than 1 or 5 feet. One season or more should then elapse before any thing further is done. In the mean time the swamp will have become sensibly drier and firmer. Let the ditch then be extended into the centre or lowest part; and should it appear necessary, let small ditches be dug, leading to other low parts from the main ditch. If the land be covered with timber or bushes, the usual mode of chopping and burning may then be adopted. Should the swamp continue too wet, let it be encircled by a ditch near its outer border and deep enough to cut off the springs which run into it; but this should not be done unless obviously necessary, as it will prevent the swamp from receiving annual accessions to its fertility from the hills around it. Those who have never witnessed the effect of draining will be astonished at the difference which in two or three years will be produced. Cattle will find a firm footing where before a man could not walk. All the operations of husbandry can be conveniently and safely carried on. With manure, crops of corn, and without it crops of grass can be obtained larger than uplands generally yield. Every year will render the land more valuable. Tillage, by exposing the soil to the warmth of the sun, and manure by producing some degree of fermentation, will hasten its improvement.

It is admitted that the process of reclaiming such swamps is generally tedious and sometimes expensive; but it is believed that in some cases a full remuneration is certain. And besides the individual advantage produced, the appearance of the country will be highly improved, for nothing presents a more delightful prospect than smooth and gently descending hollows covered with luxuriant vegetation. And the public interest will be promoted by what will amount in effect to an extensive and valuable addition to our territory.

Low and wet lands, to which the epithet swampy could not well be applied, will also receive great benefit from draining. Too much water is quite as injurious as too little, to all our valuable crops. And often a ditch may be made to answer the double purpose of draining and enclosing land. Whether draining is resorted to in all cases where it would be useful, is a question well worthy the consideration of the farmers of this country.

The suggestions to which you have listened my fellow citizens, have been offered with the greatest diffidence. I am well aware that many of you are much better acquainted than I can be, with the subjects to which your attention has been invited; and that little has been communicated which was not before known to you all. If, however, I have impressed one important truth more strongly upon your minds, shall not have spoken in vain. Truly gratified shall I feel, if what I have said shall render your arduous labors more profitable to yourselves, or more useful to your country.

THE FARMER.

BOSTON:—SATURDAY, APRIL 12, 1823.

The Farmer's and Gardener's Remembrancer.

APRIL.

Insects.—The period is approaching or has already arrived, in which it behoves every farmer, gardener, and house keeper to declare a war of extermination against worms, bugs, and the mischievous and devouring insects. If the Lords of the lower world can devise no means for repelling the attacks of those little destroyers, they must even be contented to diminish their substance with their puny partners, and not only maintain a host of creeping and crawling tenants, who consume the products of human industry, without paying rent, or rendering either homage or service, but admit some of the most voracious intruders to their bed and board.

To describe all, or the greater part of the most troublesome and mischievous beings, which belong to this department of animated nature, and the remedies against the evils which they inflict, would require folio volumes, and as much transcend our limits as our knowledge and means of information. We shall therefore content ourselves to such as are most common, and most injurious in their operations, and would promise, that the remedies which we prescribe against the ravages of one kind of insect, will frequently be found effectual against every other sort.

Among the substances, which are either offensive or fatal to all kinds of insects, may be numbered elder, especially of the dwarf kind, tobacco, quicklime, lime water, soot, unleached wood ashes, strong lie, tar or turpentine, or water impregnated with those substances, common to finely pulverized, brine, old urine, &c. &c. Boiling water is, likewise, an effectual and sometimes an expedient bug and worm destroyer. We have known beds or plats in gardens, well scalded previous to sowing them with the seeds intended for them with perfect success against worms, grubs, and every species of insect, which had its habitation in the plat, to which the boiling water was applied. This operation, if thoroughly performed, cannot fail to destroy not only every reptile within reach of its influence, but those eggs or nits which are lodged in the soil, and are teeming with future mischief would be well after a bed has been well scalded to enclose it with slips of boards, bark, or some other suitable material to prevent the access of insects from its neighborhood. Hills intended for cabbages, cucumbers, melons, squashes, &c. &c. after having been scalded, and sometimes merely carefully dug over and inspected, have been surrounded with strips of white birch bark, and remained impregnable to every kind of creeping thing. If this defence is covered over the top with a strip of gauze or muslin the plant is of course secured against the winged tribes. It would no doubt be a good plan, when boiling water is applied as before mentioned to boil a few elder roots and perhaps tobacco stalks with the water, that the worms may have the benefit of the decoction.

Care should be taken, in the application of some of the foregoing remedies not to destroy the plants instead of, or together with the insects which prey upon them. The old editions of Deane's New England Farmer recommended the application of strong brine to cabbages, in

order to destroy lice and other insects, but if the brine be too strong it will kill the vegetable as well as the insect. Quick lime and even strong wood ashes may also injure young and tender vegetables. The safest way is to apply such caustic and corroding substances to the soil, some time before the seed is put into the ground. Or they may be used while vegetables are growing, provided they are placed near without touching them. The juice of elder or a pretty strong decoction of elder (elder tea, as some would call it,) we believe is an effectual remedy against all or nearly all insects, and will not injure any plant. Fall-ploughing and elder juice we should depend upon principally in gardening as antidotes to insects. As insects are often introduced into gardens by means of dung used as manure, it might, perhaps, be well, in some instances to leach such manure, or dilute it in water, and apply the liquid part alone to a garden. This would be somewhat troublesome, but Sir John Sinclair says it is practised by farmers in Switzerland even in field cultivation, and the straw that is washed, is afterwards used as manure for potatoes. If boiling water be used in leaching the manure, the insects, together with their spawn, would hardly survive the operation. So much for insects in general; we shall mention some particular kinds, in our future essays under this head, with an intention of attending to them, before the season in which their ravages are to be dreaded, and can be best guarded against.

ON THE CHOICE OF SEEDS.—"The way to try seed is this. Put a small quantity of it in lukewarm water, and let the water be four or five inches deep. A mug or basin, will do, but a large tumbler glass is best; for then you can see the bottom as well as top. Some seeds, such as those of cabbage, radish and turnip, will, if good, go to the bottom at once. Cucumber, Melon, Lettuce, Endive, and many others require a few minutes. Parsnip and carrot, and all the winged seeds require to be washed by your fingers in a little water, and well wetted before you put them into the glass; and the carrot should be rubbed so as to get off part of the hairs, which would otherwise act as the feathers do as to a duck. The seed of Beet and Mangel Wurtzel are in a case or shell. The rough things that we sow are not the seeds, but the cases in which the seeds are contained, each case containing from one to five seeds. Therefore the trial by water is not, as to these two seeds, conclusive, though if the seed be very good, it will sink in water, after being in the glass an hour. And, as it is a matter of such great importance, that every seed should grow in a case where the plants stand so far apart; as gaps in roots of Beet and Mangel Wurtzel are so very injurious, the best way is to reject all seed that will not sink, case and all, after being put into warm water and remaining there an hour.

"But seeds of all sorts, are, sometimes, if not always, part sound and part unsound; and as the former is not to be rejected on account of the latter, the proportion of each should be ascertained, if a separation be not made. Count then a hundred seeds, taken promiscuously, and put them into water as before directed. If fifty sink and fifty swim half your seed is bad and half good; and so in proportion as to other numbers of sinkers and swimmers. There may

be plants, the sound seeds of which will not sink; but I know of none. If to be found in any instance, they would, I think, be found in those of the Tulip tree, the Ash, the Birch and Parsnip, all of which are furnished with so large a portion of wing. Yet all these, if sound, will sink, if put into warm water, with the wet worked a little into the wings first. I incline to the opinion that we should try seeds as our ancestors tried witches; not by fire but by water; and that, following up their practice we should reprobate and destroy all that do not readily sink."*

ASPARAGUS BEETS.—These should be completely loosened with a fork to a moderate depth as soon as the frost is out of the ground; but care must be taken not to go too deep, so as to wound the crowns of the roots. They should then be raked even before the buds begin to advance. "This plant is found growing naturally on the borders of salt marshes, and even upon such marshes. This is considered to be its natural situation; and this fact has led to the employment of salt as a manure to it with very good effect. To a bed fifty feet by six, a bushel of salt may be safely applied before the plants start in the spring."†

BEETS may be sown as soon as the ground is fit to receive the seeds. The rows a foot apart and the plants should be left eight inches apart in the rows. Mr. Cobbett advises to soak the seed four days and nights in rain water before it is sowed. It should be put in about two inches deep, well covered and the earth pressed pretty hard upon it. "The ground should be rich, but not fresh dunged. Ashes of wood, or compost mould is best; and the digging ought to be very deep, and all the clods broken into fine earth; because the clods turn the point of the root aside, and make the point short, or forked. Fresh dung, which, of course lies in unequal quantities in the ground, invites the tap root, or some of the side roots to it, and thus causes a short or forked beet." The Mangel Wurtzel may be cultivated much in the same manner, excepting the seeds may be further apart. We believe Col. Powell's method (described page 276 of our paper,) equal to any which can be adopted.

CABBAGE.—Set out cabbage stumps as soon as the frost is out of the ground. It is said in the Domestic Encyclopædia that "early cabbages may be procured by the following mode. In the spring as soon as the sprouts on the cabbage stalks have grown to the length of a plant fit for setting, cut them out with a small slice of the stalk, about two inches long; and if the season permit, plant them in a garden, and the usual care will produce good cabbages." The seed of cabbages should be sowed in the open ground in rows six inches distance. They may likewise be sown in autumn and in hot beds, but we have not room to state every possible variety in the mode of cultivating plants; our object being to mention merely the simplest and most economical. With regard to transplanting, &c. we shall say something in due season.

CARROT.—Dr. Deane observed "I have found by long experience that carrots should be sowed early. The last week in April is late enough, when intended for the feeding of cattle; and they may be sowed earlier, if the ground

* Cobbett's American Gardener.

† Deane's N. E. Farmer; Wells & Lilly's edition

in good order, and so dry as to be made light and loose. The earliest sown will be the largest, and, in the northern parts of the country, nearly as tender and as good as if sown later." Mr. Cobbett states that "the same season, same soil, same manure, same preparation for sowing, same inter-cultivation, same time of taking up, and mode of preserving the crop all belong to the carrot which are used with the beet. Some fine roots may be carefully preserved to plant out for seed in the spring; and the seed should be taken only from the centre seed stalks of the carrots, for that is the finest. The mark of a good kind is deep red color of the top. The paler ones are degenerate, and the yellow ones are fast going back to the wild carrot."

PARSNIP.—This plant may be cultivated in the same manner with beets and carrots. In England they are frequently raised by field culture, and by some are said to yield more and better food for stock or swine than the carrot or almost any other root.

Raisins should be sown thin in little drills six inches asunder, as early as possible in the spring, and a little bed every three weeks during the summer. As they are uncertain in their growth, it has been recommended to put in the seeds between rows of other plants; and they are so soon pulled up that they will not incommode the plants among which they grow.

PLANTING ON RIDGES.—This practice seems to be less generally approved of than formerly. Col. Powell, of Philadelphia, condemns it, (see N. E. Farmer, p. 277.) It is, we believe, less practised in England than it has been, although the moisture of the climate in Great Britain would seem to make it more proper for that country than for ours.

PREMIUMS OFFERED BY THE ESSEX AGRICULTURAL SOCIETY.

The article with the above title, with which we have commenced this day's paper, will reward a diligent perusal, not only of those who wish to become competitors for the premiums thus offered, but of every other person, who feels an interest in the theory or practice of agriculture. The variation from the usual objects of such donations appears to us to be judicious, and calculated to give new and profitable directions to the pursuits of the husbandman. The "Remarks" which accompany the statements of premiums, (as might well be expected from the eminent and scientific agriculturist, whose name is subjoined) will assist very materially in attaining the objects specified; and experiments made in accordance with those remarks, and detailed with accuracy, will add greatly to the general stock of agricultural knowledge.

Hilgoland Beans.—A writer in the American Farmer, vol. v, p. 11, says: "Farmers are frequently imposed on, by those who first offer rare seeds for sale, and I generally make experiments on a small scale: if I find the article not valuable, or curious, I discard it; for instance, the Hilgoland bean was puffed off, as a very valuable field bean, producing very abundantly. I procured two plants, (at the rate of sixty four dollars per bushel.) I planted them care fully in good ground, expecting to make enough to plant an acre or two, but was disappointed; I planted them two years, and concluded I had been imposed on. It is not necessary to give the character of this bean, as I believe all who have planted it have discarded it; I think it worthless in the extreme." We should like to know if this bean has been tried and condemned in the northern states, as we fully concur with a remark on this subject by the Editor of the Am. Farmer, viz. "It is perhaps more incumbent on us to report when the result is unfavorable than when it is promising—where is the benefit of experiments if the result be not made known? What would we say of the Pilot, who being wrecked on an

unknown shoal or rock, would refuse to anchor a buoy as a signal of danger to his brother mariner? yet we hear it is too much the fashion to suppress a knowledge of failures, in cases of new and unsuccessful processes."

Large Animals.—An ox, owned by Capt. Gilman, of Exeter, N. H. was lately killed and slaughtered in Portsmouth. The animal weighed alive 2420 lbs. the quarters 1753 lbs.—A hog brought in from Berwick on the same day weighed 754 lbs.; he was raised by William Smith, and purchased by Mr. Edmunds.

American Alum.—Samples of alum and Roman vitriol have been manufactured in Salem, Mass. which were forwarded to Professor Williman, of Yale College, and are said by him to surpass any thing of the kind, which he had ever seen. "The works in Salem (says the Salem Observer) give constant employment to nearly 20 men, and are under the management of Mr. Joshua Upham, a very capable and judicious chemist."

Cultivation of Grapes.—A correspondent in the American Farmer communicates the following method of propagating the Grape vine: Take a cutting of three eyes, and make a place by removing the earth, the same as you would to plant Indian corn in a hill, and lay in two cuttings flat at the bottom, of three eyes each, and cover them in the same manner that you would corn; out of a considerable number thus planted in a border scarcely one failed.

Preserving Vines from bugs.—A writer in the American Farmer remarks that "We last year adopted a contrivance (on the recommendation of another,) which I regard as of very great importance in the cultivation of melons. As soon as the young plants appeared, we put over them a box consisting of four pieces of shingles, or thin boards, nailed together, one foot long, and about eight inches broad—over the top of this box is stretched a thin piece of worn out muslin, or millinet, and the edges fastened with tacks to the side of the box. This cover, while it admits the air and light, protects the plants effectually from bugs and flies, and shields them from cold winds and frosts. The difference in the growth of the plants thus covered, and those which were left unprotected, was almost incredible, and I observed that while the latter were parched with the drought, the soil round the others was constantly moist, and their leaves in the morning were loaded with dew."

This device we have known put in practice with good success, and is in substance what we have recommended in a preceding article in this day's paper. To make assurance doubly sure, it might be well to scald the earth within the boxes with a decoction of elder, and thus preserve the seeds and young plants from worms as well as bugs.

Gas Lights.—A bill to incorporate a Gas Light Company, has passed both branches of the Legislature of New York. The practicability and economy of lighting streets and houses with gas is now fully established by repeated and successful trials. London and Liverpool, and many of the principal manufacturing towns in Great Britain, are lighted in this way. Hotels in Baltimore and Philadelphia are also supplied with gas lights, which are said to unite safety, economy and brilliancy, in a degree surpassing the expectations of those who introduced the improvement.

Don't scold your Poultry.—A writer in a Connecticut paper, remarks upon scolding poultry, as follows:—Scolded fowls are ill looking and will not sell for so much as those that are picked, and soon spoil, often before market; otherwise the feathers, although not of the first quality, will amply pay for plucking. By scolding, poultry is deprived of its delicious flavour, is made insipid, often producing what is termed rising on the stomach.

The application of Chemistry to the art of coloring (says the Providence Journal) is making rapid advances in this country. The artist is no longer obliged to grope in the dark for experience. Acquainted with those natural laws which are applicable to his profession, he goes on from one improvement to another with that confidence which is always inspired by knowledge.—Our blacks and blues are now as firm and brilliant as those of the best artists in Europe.

LATEST NEWS FROM EUROPE.

By a late arrival at New York, London papers have been received to the 5th, and Liverpool to the 7th March. These rather increase than diminish the chances of apprehension of war between France and Spain.

The session of the extraordinary Cortes had been solved. They had previously decreed the removal of the King, and transfer of the seat of government should invasion take place, to Cadiz. The King posted this, and dismissed his ministers. As soon as it was known the populace assembled, and threatened assault the palace. The king was alarmed and recalled his ministers, and it is supposed that he will ultimately comply with their wishes. He sits upon a tottering throne, which probably a popular gust will eventually overturn.

Meeting of Parliament.—Parliament assembled the 4th of February, and his Majesty's Message read. In this it is stated that "his Majesty declining a party to any proceedings at Verona, which could be deemed an interference in the internal concerns of Spain on the part of Foreign Powers. His Majesty has since used, and continues to use, most anxious endeavors and good offices to allay irritation unhappily subsisting between the French and Spanish Governments; and to avert, if possible, the calamity of war between France and Spain." It claims, therefore, that the British government does not approve of the conduct of the Congress at Verona in regard to Spain, and this is an important point gained by the Spaniards. If the British Lion does not roar and shake himself on this occasion he must be a half old beast, and deserves to have his whiskers spun in rope yarn, his claws submitted to the operation of Ford's or Eastman's Straw Cutter, and his eye knocked out with a mallet. A mere declaration on the part of Great Britain that she would make a common cause with Spain, would keep the restless French termiddlers on their own side of the Pyrenees, and the peace of Europe would be preserved without striking a stroke.

French Debates.—The French Assembly has had stormy session. Many of its members reprobate the war, but the majority seem determined to plunge into two rations in a sea of blood, which threatens to overwhelm all Europe rather than not support the Bonapartes. The "contagion" of Liberty they consider more to be dreaded than the plague, and are determined to put a stop to its progress by destroying the joints already infected. It is to be hoped, however, that it will break out in the camps of the invaders, and cause their forces to wither like so many unrooted cabbage plants exposed to a burning meridian sun.

A friend to Liberty.—Mauvel, a member of the French Chamber of Deputies, has made himself famous by his opposition to the unjust and nefarious Crusade against freedom in Spain. He attempted repeatedly to utter his sentiments, but was as frequently overpowered and his voice drowned by the hubbubs of the partizans of despotism. The people without, the spectators, and multitudes in the streets, cheered and applauded the efforts of Mauvel, and it is the opinion of some sagacious observers that his exertions, together with the manner in which the populace have received him, will induce the French government to pause before they enter Spain, and perhaps cause the indefinite postponement of hostilities.

Opote is now open to the admission of foreign grain about 1600 tons had arrived; but such is the extent of the wants of the country, that it produced little or no impression on the markets. It is expected that Lisbon will also be opened. Barcelona has also been opened for two months, from the 14th of February. There is no doubt but that scarcity exists in all the provinces of Spain and Portugal.

The Emperor of Russia arrived in the capital of his dominions on the 3d February, after an absence of six months. He immediately proceeded to the cathedral of our Lady of Cassan, where Te Deum was performed for his safe return. The city was illuminated in the evening.

Voyage of Discovery.—It has been reported that the vessels under Capt. Parry, which undertook to seek a north-west passage, had been seen in the Pacific ocean on their return, after having effected the object of their voyage. This report, however, we are sorry to observe, has been contradicted.

Storm.—Papers from the South give sad accounts of the effects of the late storm. At Norfolk the rain and lightning were very severe, with much wind and little snow. In Philadelphia considerable damage was done to the shipping and wharves, and quantities of cord wood were floated away by the unusually high tide. The Democratic Press informs "the sloop Tripler, with several smaller vessels, literally been ground to pieces." The N. York Herald Advertiser gives a long and deplorable account of disasters among the shipping and wharves, several buildings on shore were likewise demolished—the fury of the equinoctial tempest.

Accy and Murder.—Captain Robinson, of the brig *Albatross*, from New Orleans, states, that the brig *Albatross*, in Perkins, of Kennebunk, arrived at the Balize on the 21st of March from Port au Prince, via Camaguey. While at the latter port, Capt. Perkins' brig was boarded by a piratical scho. of about forty tons, armed with a crew of forty brutes in human shape, headed by Capt. P. in several places, and cut off his arm. Capt. P. then made known where the pirates would find what money was on board, which amounted to about two thousand doubloons. Not satisfied with this, the murderers proceeded in their work, and cut off the right arm, and one of his legs, the knee. The inhuman monsters then dipped quantity of oakum into the oil, and after filling the mouth of poor Perkins with this combustible, they set him in the oakum, and setting fire to it, soon roasted his sufferings. The mate was stabbed through the thigh. The brig was robbed of every valuable article.

A French brig *Jenne Henriette*, from St. Jago de Capatzen, having been robbed of almost every thing on board, has put into Savannah. Two ladies, passengers in the scho. bound to New Providence which had been previously robbed, were put on board the French brig. The ladies have been robbed of every thing. One of them, with a small child by her side, was put round her neck, and a knife held to her throat to enforce a disclosure whether any money was on board. The ladies suppose the crew to have been ordered.

Mr. Harding, who arrived in Boston last Monday, says from Havana, left there, scho. *Evergreen*, Capt. Upton, from Salem, just arrived—was chased by the Bay of Matanzas, by two piratical boats, and coming down for Havana, threw over her deckboard a get clear of a piratical scho. Brig *Alert*, of Portsmouth, from New Orleans, with a deck load of live stock just arrived. Off the Moro, she was boarded, and taken by two piratical boats, with six men and *Captain Charles Blunt*, (of the *Alert*) was thrown overboard! The Cook was stabbed and thrown among the hogs, and nearly devoured by them before being discovered and rescued. Several crew badly wounded, and the brig robbed.

Michael Doak Dennis, a foreigner, for many years a hard of a man of war, but who had lately undertaken to preach the gospel, has been sentenced to three months imprisonment, for abusing and insulting a respectable married woman, at Newburyport, by a lewd and offensive language.

It is stated by the Georgetown Metropolitan, as an evidence of the pressure of the times, that there were seven hundred applications for the office of clerk in the departments, vacated by the death of a incumbent.

Mr. H. Traphegen, of Harsimus, N. J. raised last year about 20,000 cabbage heads for this market, but being able to dispose of the whole from his farm he manufactured the residue into *sour kraut*, which he now sells at from 8 to 10 dollars per barrel, for exportation to India.—*N. Y. American*.

Cals.—Our brethren of the Southern States (says the New York Statesman) will probably be surprised to learn that upwards of two thousand men have been taken upon our canals during the whole of the cold season passed. In May next the number will be increased to six or seven thousand, and by October it is intended to open the navigation from Lockport to Albany 330 miles. Thus we manage matters in this State.

ELECTION OF GOVERNOR, &c.

Last Monday was the day for the election of Governor, Lieut. Governor and Senators, throughout the State. The votes in this city were as follows:

Hon. H. G. Otis, 2336.—Hon. Wm. Estlin, 2728.

We have returns from 213 other towns, which give Otis 24,592—and Estlin 27,902. Maj. for E. 3,310.

SENATORS ELECTED.

Suffolk.—John Phillips, Thomas H. Perkins, Peter C. Brooks, Samuel Hubbard, Benjamin Gorham, and Thomas L. Winthrop.

Essex.—Nathaniel Silsbee, John Prince, William W. Parrott, Nathan Noyes, Aaron Lummus, and Moses Wingate.

Middlesex.—Joel Cranston, Levi Thaxter, Jno. Wade, Seth Knowles, John Keyes.

Norfolk.—John Ruggles, Josiah J. Fiske, Sherman Leland.

Sufficient returns have not been received to enable us to state who are elected in the other counties.

Distressing Accident.—David Dunham, Esq. a respectable merchant of New York, fell overboard from a sloop in descending North river, about forty miles above the city, and was drowned.

Miss Mary Davis, of Franklin county, N. C. lately wove a bag which will hold three bushels, without a seam. It was wove with three treadles.

New Potatoes of the growth of the present season, raised by Aaron Sisson, of Seckonk, were brought to town on Saturday, and served up at Horton's hotel, yesterday, at dinner. They were planted late in autumn, and covered with a layer of sea-weed and earth. *Providence Journal*.

Postage.—A gentleman of Manchester, (Eng.) lately had to pay for a letter, one pound, fourteen shillings and ten pence. It contained a gown of the value of twelve shillings, sent as a present to his wife, and ordered through mistake "by post."

This reminds us of a member of Congress, not far from South Carolina, who franked Scott's Family Bible, and sent it in the mail from Washington to his wife.

The late Mr. Granger, while Post Master-General, availed himself of his privilege of travelling gratuitously in the Mail Coaches—but on one occasion the driver, not apprized of his station, told him that if he wished to go free, he must get *into* the mail. This expedient, which was totally impracticable, was fortunately unnecessary.

THE STATISTICAL ACCOUNT OF SCOTLAND.

DRAWN up from the communications of the Ministers of the different parishes, by Sir JOHN SINCLAIR, Bart. 21 vols. 3 vo. complete, only one copy; will be sold at the very reasonable price of \$50.—Among 58 heads of inquiry addressed to each minister (the whole being too numerous for an advertisement) as a guide for their reports, are—Name, and its origin; description of the soil and surface; climate and diseases; instances of longevity; mode of cultivation; implements of husbandry; manures; seed time and harvest; quantity and value of each species of crop; total value of the whole produce of the district; wages and price of labor; manufactures; man. of kelp; police; roads and bridges; state of the Church, stipend, &c. number of the poor; parochial funds and the management of them; schools, and scholars; number of souls; cattle, nature and value; sheep do.; swine do. coal and fuel; antiquities; character of the people; advantages and disadvantages; means by which their situation could be meliorated. "No publication of equal information and curiosity has appeared in G. Britain since Doomsday Book; and that, from the ample and authentic facts which it records it must be resorted to by every future Statesman, Philosopher and Divine, as the best basis that has ever yet appeared for political speculation."

Also—The Complete Grazier, &c. 1 vol. 3 vo.—American Orchardist—Cully on Live Stock—Farmer's Assistant—Farmer's Manual—American Gardener—Villa Garden Directory—Cox on Fruit Trees, &c. &c. For sale by R. P. & C. WILLIAMS, Cornhill Square, Boston. April 12.

SAFFORD'S STRAW CUTTER.

THE utility of cutting Hay, Straw, and other substances for feeding cattle, is now so universally acknowledged that any remarks on the subject must be deemed superfluous. The following Certificate will therefore be conclusive of the merits of the above mentioned Machine.

Boston, March 22, 1833.

We, the subscribers, have in operation a Straw Cutting Machine invented and exhibited in this city by Noah Safford, and we do not hesitate to say that in our opinion it exceeds any other we have ever seen, for cheapness, simplicity, despatch and durability.

STEPHEN HARTWELL, SEUR & HOLMES,
HEZEKIAH EARL, ANDREW SLATER.

The above mentioned Machines may be had of J. R. NEWELL, at the Agricultural Establishment, No. 20, Merchant's Row, Boston. Price \$15.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but those who pay within *sixty days* from the time of subscribing will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the Publisher) until arrearages are paid.

Complete files from the commencement of the paper in August can be furnished.

From the Connecticut Herald.

AN ACRE OF CORN.—By DR. PERCIVAL.

I am a poor Ploughman, who never have wander'd
Away from the sight and the pleasures of home;
I have always been prudent, and never have squander'd,
And so I have never been driven to roam.
For thirty long summers my shoulders have bended
In tilling the farm where my father was born;
I live under his roof, and this season have tilled
With the plough that he left me, an acre of corn.

Though others may go to the Southward and peddle,
And bring home of guineas and dollars good store,
I never have dind'd with their crankums to meddle,
But to hoe in my garden that lies by my door.
When the sun is first rising I always am hoeing
The mould, when 'tis wet with the dews of the morn;
And when he is higher you will find me a mowing,
Or driving the plough in my acre of corn.

There are some who are crossing by sea to the island
They call Santa Cruze, with their horses and hay;
For my part, I'd rather be safe here on dry land,
And hoe in my garden, or work by the day.
I am out to the field with the sun, and am mowing
'Till called up at noon by the sound of the horn;
Or else I am twirling my hoe, and am throwing
The mould round the roots in my acre of corn.

This corn is the sort that is tufted and bowing,
And when we have thresh'd it, 'tis made into brooms;
'Tis the best of all besoms, so far as I'm knowing,
To sweep out the dirt and the dust from our rooms:
They always have rais'd it, since I can remember,
And, my father once told me, before I was born
He made brooms for his trade, and I guess by December
I shall make up a load from my acre of corn.

AURORA BOREALIS, OR NORTHERN LIGHT.
(Concluded from page 293.)

It is known that the electrical fluid pervades every part of the earth and its atmosphere.—This substance, like all other fluids, has a tendency to become equally as well as universally diffused over all the objects and space which it pervades. The equilibrium, however, may, by various causes, be destroyed for a time. The process which nature institutes for restoring the equilibrium is sometimes carried on in a silent and invisible manner—sometimes it is accompanied with a hissing, or crackling noise, and sometimes it flashes in lightning and roars in thunder. A body which has more than its natural quantity of the electric fluid is said to be positively or too much electrified; and a body which has less than its natural quantity is negatively or too little electrified. These extremes may be produced by art. In turning the glass cylinder of an electric machine you deprive the rubber of its natural quantity of electricity, and it accumulates in the glass, and thus the former becomes negatively, and the latter positively electrified. By presenting a needle towards the conductor you will see a bright point near its extremity, and hear a hissing noise. This is the same phenomenon, on a small scale, with that which appears so wonderful in the aurora borealis.

It has been well ascertained that cold air, or cold substances, such as ice or snow, are positively electrified. Warm air, especially if it is moist, is negatively electrified, or a non-electric substance. Those substances which are positively electrified are perpetually giving out the electric fluid to all surrounding objects, and those which are negatively electrified are perpetually receiving the same fluid from objects about them. The same thing takes place with regard to caloric or the matter of heat. If a red hot iron is exposed to the atmosphere, sup-

pose at the temperature of summer heat, it gives out caloric to the atmosphere; but a piece of ice, with the same exposure, would receive caloric from the atmosphere. And, in the same way, ice or snow, having a surplus of electric fluid, discharges a part into the atmosphere, when it is comparatively warm, and has of course a deficiency of the electric fluid. But if the earth be warmer than the atmosphere the former becomes non-electric and receives the electric fluid from the latter, as is generally the case in thunder storms, when some parts of the atmosphere must be intensely cold, which is apparent from the circumstance that such storms are often accompanied with hail, which could only be generated where the cold was extreme.

We shall attempt to make our meaning very obvious by adverting to some instances of the electric fluid rendered visible to the senses, in its passage from the earth into the atmosphere. On the 18th of Jan. 1817, in Andover, Vermont, there was a heavy fall of snow, accompanied with lightning and thunder. Joel Manning, Jr. Esq. of that place, in a communication for the Vermont Republican, states that during that storm, he, together with a companion observed "on the top of a stake in the fence, a light, resembling a blaze of fire, about two or three inches in length, though not so red and brilliant. We soon observed that on every stake was a light, and also on the highest branches of bushes by the side of the fence. This excited so much wonder and curiosity that we called the people of the house, and also some who were passing in the street, to see the phenomenon. We soon observed it on our hats, hair and mittens, when held up, not in the form of a blaze, but of bright white sparks of various sizes, from those which were just discernible to those of the size of buck shot. On one stake there were three of those blazes. On two or three stakes they emitted a sound resembling the hissing of a pot when it boils."

Similar appearances were observed in Putney, Vermont, during the descent of a moist snow, accompanied by a heavy clap of thunder, on the evening of the 3d of April, 1818. These phenomena, were, no doubt, aurora borealis on a small scale, and resembled those which have been before mentioned as having occurred in Siberia, even to the "hissing or crackling noise" which has been represented as adding terror to the sublimity of their appearance.

It is undoubtedly the case that many of the prodigies recorded in ancient history were caused by apparitions of the electric fluid, similar to those above described. Streams of electric fire have been seen issuing from the points of the bayonets of soldiers passing the Alps and other mountainous places. Vessels at sea sometimes show their mast heads and yard arms illuminated as it were by magic, and men's heads have been seen surrounded with a halo of glory, such as painters represent about the head of a saint. These, as well as the northern and southern lights, are unquestionably among the modes by which electricity, that universal, all-powerful, but usually invisible agent sometimes makes itself manifest to our senses.

It has been generally supposed that northern lights were never seen or noted by the ancients. The first notice of them in English annals, according to Rees' Cyclopaedia is an account of an appearance, Jan. 30, 1560, called "burning

spears," by an author of that period. In this country they are said to have been first observed a little previous to the old French war. There is, however, but little doubt but that the prodigies mentioned by ancient historians, such as armies in the sky, troops of celestial horsemen skirmishing in the heavens, &c. were nothing more than northern lights, magnified and shaped into fighting phantoms by fear and superstition. These were particularly noticed having appeared at the siege of Jerusalem, the death of Julius Caesar, and other great and memorable occasions. The following from H. M. Beebe, ver. 2, 3, seem as remarkable, and perhaps, as vividly described as any record in ancient history.

"And then it happened, that through all the city, for the space of almost forty days, there were seen horsemen, running in the air, cloth of gold, and armed with lances, like a band of soldiers.

"And troops of horsemen in array, encircling and running one against another, shaking of shields, and multitude of pikes, drawing of swords, and casting of darts, glittering of golden ornaments, and harness of all sorts."

PROPOSALS,

FOR PUBLISHING BY SUBSCRIPTION A COLLECTION

FUGITIVE POEMS.

MORAL, SENTIMENTAL AND SATIRICAL.

BY SELLECK OSBORN.

THE author of the articles which are to compose this volume, never wrote with a view to far profit; he merely obeyed the impulse of the moment. Of those which were sent to the press he seldom retained copies; and they were usually forgotten by him until recalled to his mind by public prints, which often gratified him by flattering notice, but which also frequently annoyed him by mutilations which were extremely mortifying. This last circumstance (besides private solicitations and other motives) has induced him to collect, with considerable pains, his scattered effusions, and to add some unpublished pieces; which altogether will have at least the merit of being new; and perhaps that of inculcating to the best advantage the author's capacity, good principles and amiable sentiments—excluding all matters relative to party politics.

Disinterestedness is not pretended: It is confessed that a liberal patronage would be very acceptable in various accounts. The author confides in the zeal of his friends throughout the Union, for the promotion of his interest in this case.

The volume will be neatly printed, in a duodecimo form of 200 pages, on handsome paper, with type freshly new, and well bound in boards, at one dollar payable on delivery.

A commission of 12 per cent will be allowed agents on all returns made.

Gentlemen holding subscription papers will please return them by the first of June next, or as soon as reasonable efforts have been made to obtain subscribers.

Editors of newspapers will oblige the author by publishing or noticing these proposals, and receiving subscriptions.

Communications to be addressed to the author at Merchants' Hall, Boston, Mass. April

NEW GARDEN SEEDS.

FOR sale, by GEO. MURDOCK, No. 14, Market Square, a great variety of English and American GARDEN SEEDS, of the last year's growth; including early Frame, Hotspur and Charlton Pease; early and late Cabbage; early and late Cauliflower; Savoy, Marjoram, Thyme, &c. with every other Seed suitable for a Kitchen Garden. Also, 40 lbs. Mangel Wurzel or Scurfey—100 lbs. Ruta Baga or Swedish Turnep—a quantity of Armack or Carrot. March 29.—6

NEW ENGLAND FARMER.

PUBLISHED BY THOMAS W. SHEPARD, ROGERS' BUILDINGS, CONGRESS STREET, (FOURTH DOOR FROM STATE STREET.)

VOL. I.

BOSTON, SATURDAY, APRIL 19, 1823.

No. 38.

FACTS AND OBSERVATIONS RELATING TO AGRICULTURE & DOMESTIC ECONOMY. FOR THE NEW ENGLAND FARMER.

PRESERVING AND IMPROVING THE QUALITY OF GRAIN.

When wheat has been injured during a bad harvest, it ought to be put into small stacks, in which state it will dry much more quickly, and is sooner rendered fit for grinding into flour. If stacked in a damp condition, it should rarely be threshed earlier than the summer after it has been harvested, when its condition will be greatly improved.

Wheat, if not in good condition, is much improved by kiln-drying; but it should not be dried, unless in cases of necessity, until some time after it has undergone that operation. It ought to be moderately kiln-dried, with a slow fire, and frequently turned. But if the grain is musty, it ought to pass through a previous process, which is thus described by an eminent chemist.

The wheat must be put into any convenient vessel, capable of containing at least three times the quantity, and the vessel must then be filled with boiling water; the grain should then be occasionally stirred, and the hollow and decayed grains, (which will float) may be removed.

When the water has become cold, or, in general, when about half an hour has elapsed, it is to be drawn off. It will be proper then to immerse the grain with cold water, in order to remove any portion of the water, which had taken up the must; after which, the corn being completely drained, it is, without loss of time, to be thinly spread on the floor of a kiln, and thoroughly dried, care being taken to stir, and to turn it frequently during this part of the process.

By this simple operation, it is said that grain, however musty, may be completely purified with a very little expense, and without requiring a very expensive apparatus.* Mere ventilation, however, has been recommended as a means of preparing grain for use, sufficiently effectual.

When grain has been infected with smut, it can be thoroughly cleaned, however black it may have been, in the course of three washings, in a wooden tub. The wheat should be afterwards kiln-dried.

It has been generally supposed, that if wheat be much injured during a bad harvest, the flour made from it will not ferment, or bake into loaf bread, and that it is only fit for distillation, or to be eaten by live stock. But such an idea appears to be erroneous. With the aid of yeast, the flour may be much improved; and, at a moderate rate, may be made into cakes or biscuits, and consumed with safety and advantage.

Code of Agriculture.

No doubt, but the mode here recommended for preparing other kinds of musty grain would answer for rye or sour Indian Corn.

It may likewise be made into what are called *flour cakes* in Scotland, prepared with milk instead of water. A species of bread, wholesome and palatable, but not fit for laboring people, being too easily digested. Perl ash, or Magnesia will answer a similar purpose with soda. For a mode of using the latter substance, see N. E. Farmer, No. 1, p. 4.

MANAGEMENT OF THE GRAIN IN GRANARIES.

Granaries in Europe are large buildings of many stories, each of which consists of one entire apartment, where the grain, by turning and sifting is deprived of its superfluous moisture, and rendered more fit for grinding into flour. These operations are performed in the following manner: the corn being deposited on one of the floors, it is tossed by means of shovels from one end of it to the other, in which operation the dust and any other light substance falls to the floor, whilst the grain, being heavier, reaches the farther end of the floor.

It is then sifted and spread on the floor about half a foot thick, turning it twice a week, and sifting it once, which management must be continued for the first two months. The grain is then laid a foot thick, and for the two next months is turned once a week, and screened less frequently. This management is to be continued for five or six months, when it may be increased to two feet thick, and the former operations repeated as occasion requires, which will be more frequent in damp than in dry weather.

The above directions are calculated for the climate of Great Britain, which being remarkably moist, requires greater precaution for preserving grain, than would, perhaps, be necessary in the U. States. In a matter of great consequence, however, it is better to take too much than too little pains, and give your grain one or two, or half a dozen superfluous siftings, than to suffer it to spoil for want of due attention.

Dr. Walker, in his *Economical History of the Hebrides*, gives us a dismal picture of the circumstances of some of those islands, with regard to timber. "The inhabitants" (he observes) "have to undertake a dangerous voyage, from thirty to seventy miles, before they can build a barn, make a plough, or even procure a flail, or the handle of a spade. This want of timber distresses the people in their houses, in their husbandry, and in every art."

The same writer, and in the same work, takes notice of a peculiar product of the bark of the white birch (*betula alba*). It is a gum of a very agreeable smell, which in winter and spring covers the buds, and abounds in the bark. It is glutinous, odoriferous and inflammable; it is extracted by the Germans and Russians in the form of an oil, which is employed in tanning leather, to which it communicates an agreeable odour. The process of extraction, he says, is simple and easy, a countryman could be taught it in a day, but does not explain the process. Dr. Walker adds "the oil is a powerful vermifuge. In Lithuania and Courland, it is used for curing the itch and vermin in cattle; if it could be procured cheap and in abundance, it might be found preferable to butter and tar for smearing sheep." We wish some of our chemists and medical men would give us a little of this *oil of birch*, together with directions how to obtain it in quantities—its medical and economical properties, &c. The tree itself is very common, we believe, in most of the woodlands of the northern states.

WOOD LOTS SHOULD BE PLACED AGAINST CATTLE.

In the General Report of Agriculture in Scotland it is stated that "One of the great causes of the disappearance of the extensive forests, which authentic history assures us to have existed in former periods in Scotland, unquestionably is the introduction and multiplication of cattle, and of sheep especially. In the bite of cattle there is a peculiar malignancy to the growth of woods: the irregularity of the incision poisons the plant. The very rubbing of cattle against a tree, by stripping off the fine scarf-skin of the bark, and leaving the abraded hair of wool, is alone a poison to the tree."

ON LAYING DOWN LAND TO PASTURE.

When pasture is intended, the scythe is never admitted by many farmers, it being an established maxim, that cutting the grass the first year is highly pernicious to it afterwards. Nor is this difficult to be accounted for. The scythe is pernicious because the herbage has been allowed to get too old before it is used. The bite of cattle might be as injurious, if the grass or herbage were only to be eaten at an advanced period of its growth, and if eaten equally low with the cut of the scythe, or as grass is generally cut down. Perhaps the state in which the scythe leaves the roots, exposed to injury from the weather, after they have put forth all their powers, is likewise injurious. The bite of cattle, on the other hand, is like the operation of clipping the top of a thorn-hedge, which has always the effect of thickening the lower branches.*

PERMANENT PASTURES AND MOWING LOTS.

It appears to us that our enterprising farmers frequently incur a great expense without adequate remuneration, in breaking up and cultivating old pastures. We do not maintain that it may not sometimes be advisable, and the experiment of Messrs. Rice & Howe, as mentioned No. 29, pages 228, 229 of our paper, seem to be in favor of the practice. We have known, however, pastures ploughed up at a great expense, which were so situated that manure could not be applied, without costing too much for profitable tillage, and after one or two crops of rye had been forced from the soil it was laid down again to grass. But we have invariably found the last state of such land was worse than the first. If pasture or mowing land is broken up at all, it ought to be tilled thoroughly, manured plentifully, and be in good heart, as farmers phrase it, before it is laid down again to grass. Mowing ground which has been once converted into tillage, will sooner be bound out, or become too toughly swarded, than that which has been continued in grass. It is, however, sometimes expedient to break up lots for the sake of levelling the hillecks or "cradle hills" as they are called, subduing bushes, clearing away stones, &c. even when such lots are intended to be principally if not permanently devoted to grass. But, it is a fact, perhaps not generally known or thought of, that land which

* Gen. Report of Agriculture in Scotland.

has been once ploughed and made mellow, then laid down to grass, and mowed or pastured, without manure, will in a few years become more hard and compact than if it had never been visited with a plough. It has been observed to us, by a friend, who is well acquainted with the theory and the practice of farming, that if a hole is dug in the ground, (say for the purpose of setting a post) and the earth taken out is returned again, it will, in a few years, settle so that its surface will be somewhat lower than it was before the excavation.

The following are the advantages of permanent pastures as enumerated by a British writer: "Old pastures feed cattle to a greater weight; they are not so easily scorched by the summer's drought; the grasses are more nutritive both for sheep and cattle; milch cows fed upon them give richer and more butter; the hoofs of all animals feeding on them are better preserved; they produce a greater variety of grasses; when properly laid down, they yield a succession of pasture through the season; the herbage upon them is not only sweeter, but more easily digested. On all these accounts old turf is said to be superior to pasture on land more recently laid down to grass. Accordingly, permanent pasture is held in the highest estimation, and proprietors, by rigid stipulations, and the exaction of severe penalties, restrain tenants from ploughing them up."* The same author, however, allows that when grass lands are properly treated, after being broken up, if again laid down to grass, they are not found to be deteriorated in the smallest degree, but the reverse. By "properly treated" it appears is meant thoroughly ploughed, and made mellow, well manured, and fitted with a proper rotation of crops.

The following rules are laid down by the same writer. "1. To enclose those pastures where practicable, as the same quantity of land, when sheltered, will feed a greater quantity of stock, and to better purpose, than when in an open and exposed state. 2. Never to overstock poor pastures; for when this is done, not only are the cattle starved, and the quantity of food diminished, but the soil is impoverished. 3. When the pasture ground is inclosed and subdivided, the stock ought to be shifted from one enclosure to another at proper intervals. This practice tends to increase the quantity of grass, which has thus time to get up, and the ground, being fresh and clean when the stock return to it, they will feed more greedily and with greater relish. 4. The dung dropt by the stock while feeding, should be spread about, instead of remaining in the place where it was left. 5. Where the larger and the smaller kinds of stock are to be fed on the same pastures, the larger species should go first. 6. It is not advisable to depasture with a mixed collection of different species of live stock, unless the field is extensive, and also, perhaps unless the herbage be of a quality somewhat different, in different parts of the field."

MOSS ON FRUIT TREES.

"The trees in old orchards, especially where the bottom is moist, often get overrun with moss. These are sometimes merely rubbed off; and this is more easily and effectually done

in wet weather than in time of drought. A hollow iron instrument is sometimes employed; but a hard wooden scraper, shaped like an ivory folder answers very well. The trunk and branches are afterwards hard swept with a birchen broom. It is found very useful, after rubbing, to wash with soap suds, or to apply a coating of the consistence of paint, of a mixture of equal parts of quick lime, cow droppings and clay. Liming and dunging the ground about the trees is found to be a good preventive of moss."* Soft soap is said to be a good application to the trunks or bodies of fruit trees.

IRON NAILS INJURE FRUIT TREES.

It often happens that some of the limbs of fruit trees, trained against a wall, are blighted and die, while others remain in a healthy and flourishing state. This has been erroneously attributed to the effects of lightning; but from closer observation it has been found to arise from the corroding effects of the rust of the nails and cramps, with which trees in this situation are fastened. To avoid this inconvenience, therefore, it requires only to be careful in preventing the iron from coming in contact with the bark of trees.

* Gen. Report of Agriculture in Scotland.

From the Albany Argus.

Mr. James' Speech in the House of Assembly, on the Bill to repeal the Law for the Improvement of Agriculture.

MR. CHAIRMAN—As my feelings, habits, and interests, are altogether agricultural, I cannot consent to give a silent vote on this occasion. I shall not however, attempt to go much into detail on the subject, but merely throw out a few desultory observations.

I confess sir, that I am not a little surprised to see gentlemen, and farmers too, so zealous in endeavoring to vote down a law, which has been one of the principal means of elevating their profession from a secondary, to the first rank in society; let us for a moment look back twenty years, and see what was the state of agriculture at that day, and in what grade of society the farmer was then ranked. I well recollect when the farmer was considered a subaltern, it is almost every point of view. Within my recollection, the interests of agriculture in Berkshire county, was at its lowest ebb, and such was the state of the public mind as to occasion such extensive emigrations, as seemed to threaten a depopulation of a fair portion of the county.

I have since seen the same county flourishing and happy, its citizens engaged in the great business of agriculture and domestic manufactures, the cultivator of the soil as respectable and honorable as the judge upon the bench, or the dealer in silks.* The question now arises, how happens this reverse of times? Sir, it is produced by the liberal spirit which is contained in the principles of the law, which we are now attempting to repeal; it is brought about by our agricultural societies. As it respects this state, the fact is that the soil is generally so productive, that it may be said that nothing more seems necessary to be done, than to plough and sow; that the meanest capacity is as likely to realize a good crop, as the most skillful ag-

riculturist. This consideration, if it had reweight to sustain it, is not entitled to impre this committee unfavorably to agricultural societies, for it ought to be recollected, that many of our poor lands were also once equally productive, and that now, under the old system of husbandry, without the aid of some science would become a barren waste. We have societies and schools for promoting a knowledge of the healing art, of philosophy, letters, natural history, military science and many other important objects: man is a social animal, and we look through the whole of his moral constitution, we find that no objects of great importance are accomplished, except by the joint cooperation of many to the same end; no man can embrace perfect knowledge; if he could it would die with him unless communicated to others; hence the benefit of all these institutions, by which the discovery of one is imparted to many, and perpetuated to future ages. New improvements are made upon the old; accidental discovery leads to a new and improved system: and mutual instruction carries us to the highest state of improvement, of which human society is capable. Is it then to be admitted that agriculture is so low, and so degraded an employment, that nothing more is to be learned on that subject? This at least seems to be the opinion of some gentlemen. Are we ready to say, that the farmer is a mere brute animal like his ox, who has only to exert his strength; that his occupation neither needs nor admits of the application of good sense, science, invention or improvement? For myself, sir, I think far otherwise; I believe there is no pursuit in life, in which there is more employment for the best faculties of an enlightened understanding.

The farmer should have a thorough knowledge of soils, and the best and most improved methods of cultivation; he should be ready to adopt the improvements that tend to the saving of labor and expense, and the increasing of products. If there is a way to make two blades of grass grow, (and there are many such ways) where but one grew before, he should know it, and give himself and his country the benefit of it. If a breed of stock is found, more kind of milk or fat, than he had before, his attention should be alive to the subject. Sir, I think will not be denied, that great improvements have been introduced, in these respects, and is no wise likely, that we have yet attained perfection.

I beg leave to cite one example of great extent and importance, of an improvement, which has been brought about by the efforts of ingenious farmers. We all know what was the old system of letting wheat land lie fallow from one to four years; it was the custom in this country, and perhaps in many parts, prevails even yet.

It is only in our own day in this country, that the alternate system of grass crops, and grain has come into use. It is now found much better for the lands to bear a crop of clover or turnips, or some such article, by which more manure is made, and the land improved, while the value of the crop is gained. This single improvement, when followed up, and universally adopted, will perhaps double the means of subsistence. If we confine our views to this single fact, which cannot be controverted, and in supposition that the practice shall become genera

* Gen. Report of the Agricultural State of Scotland, pages 24, 25.

* Mr. James was formerly a resident in Berkshire, and was an early patron of the Agricultural Society.

rough the instrumentality of agricultural societies, let me ask, is the sum, which would probably be expended in the two years to come, be brought into competition with such an important improvement.

These are the mere items on the score of improvements which are now making. Can it be denied, that our farms would be better, and more productive, if these things were more generally understood.

It is in these societies, that they are explained, exemplified and encouraged; they are therefore of immense benefit to the public.

I will offer one other remark. A thirst for agricultural knowledge, has gone abroad in the world, and will increase; great improvements are rapidly making; is it better then for our farmers, that this knowledge should be limited and confined to a few, or that it be extended and diffused to the many.

Every farmer, who has natural understanding, ought to be a well informed man, in reading and thinking, in theory and practice; such we ought to be, and such the farmers of this country can be.

In my view, sir, one of the best means to use us to that dignity, and respectability, which I consider as belonging to an American farmer, would be, to establish and perpetuate the system,* which this bill contemplates to abolish.

In short, sir, I am unwilling to part with a law which has been so beneficial to the best interests of the state—a law which has been so instrumental in producing that equality among our citizens, which is so essential to the prosperity and happiness of all republican governments.

I hope at least we shall permit this law to die a natural death. I shall therefore vote against the bill with all its amendments.

* As some gentlemen doubted, whether the state of Massachusetts sustained her agricultural societies, the best answer I can give, is an extract from Gov. Brooks' speech to the legislature of that state. He says:

"You will, I am sure, observe with complacency attention bestowed on agriculture. The improvements manifested in the culture of the soil, and in the quality of our stock, have increased the amount of our productions, which, after yielding an ample supply for our own consumption, has furnished a respectable surplus for the purpose of commerce."

"To the ordinary motives to agricultural enterprise, arising from personal and domestic wants, and from the certainty of producing a ready market for a surplus, there have been superadded in the course of the last few years, munificent grants of the legislature, to the respective agricultural societies in the state, and the no less liberal contributions of individual citizens to the same object."

From the American Farmer.

NORTH DEVON CATTLE—THEIR PRICES IN ENGLAND.

Many gentlemen express surprise at the prices asked for cattle of improved breed, from imported stock, without reflecting sufficiently on the causes, which go to shew the justice and reasonableness of such prices. The breeds in highest estimation now in England, are the improved short horns, the Herefords, and the North Devon cattle. These several breeds, in the perfection they now exhibit for the various purposes, for which neat cattle are reared, have been brought to their present condition, by immense expense, by great skill in the selection

of the progenitors, and unwearied attention to every particular, for more than half a century. Is it then reasonable to expect, that they should be sold for any thing near the prices of common cattle? As well might we expect to purchase a fine full grown tree, bearing abundantly the high flavored pipin, for the price we should have to give for the scion of a common red-streak. We have ascertained by actual purchase, the cost of the improved short horns, when procured under the most favorable circumstances, and from one of the very best breeders of that stock in England—and we have already stated at different times, the prices of the Herefords purchased by Mr. Clay, and others in Kentucky; but the North Devons of full blood, which have fallen under our notice, were a free and spontaneous offering, to their present owners, by that enlightened and generous farmer, Mr. Coke, of Norfolk. His opinion of their superior qualities, has already been published in the Farmer, but we knew not what would be the cost of such cattle in England. Having heard that a gentleman who owns a cow of this breed, has sent to England to procure some heifers, we solicited such information, as he might have received, as to the prices at which they are selling, to which he has politely replied by the following note:—

MR. JOHN S. SKINNER,

Dear Sir,—In answer to your enquiry respecting an order sent to England, for Devon Cattle, I take pleasure in communicating the result.

Last May I wrote to Messrs. Wm. and Jas. Brown & Co. of Liverpool, to purchase and ship to me, by a vessel in which I had previously engaged accommodation for them, three full bred Devonshire Heifers, provided their cost did not exceed \$70 or 80 each, and on the 4th July, they wrote as follows:

"We should be very glad to carry your wishes into effect, as respects the stock you want; but we are sure it is quite impossible at the prices you quote. The Earl of Sefton is the only person in this neighborhood who has any Devon Cattle, and he bought them at Mr. Child's September sales, at two or three times the price you mention, and none of his Lordship's are to be sold."

If I mistake not, you are in possession of the prices obtained by Mr. Child, at his last September sale for Devon cattle, and which I think will confirm the above letter.

Your's very respectfully,

H. T.

Baltimore County, 11th February, 1823.

From the American Farmer.

MILLET.

Burlington, March 23, 1823.

DEAR SIR—I observe in your 52d number, just received, mention is made of white milletseed, received from Col. Pickering. I am desirous of ascertaining whether this is the same kind, which I have cultivated for several years, of which I send for your inspection a small sample.* In 1821, I had about 11 tons from five

* The Millet sent by Mr. Cox, is of the common kind, and that which is generally referred to in communications which relate to that grain. That from Col. Pickering, was very different, being somewhat larger, rounder, and whiter grain.—Ed. Am. Farmer.

acres, and last year about the same product, from another lot of about 5 acres. I cradled it as wheat, bound it in large sheaves, brought it in the following day—threshed the sheaves at the end of several months, without unbinding them, and obtained about 17 bushels of seed per acre; returned them to the mow for the use of my horses, who ate it as greedily as the best timothy hay. This mode of managing the millet saves much room, as it is very bulky; more seed is saved, than when cut with the scythe as hay—I calculated the product at about 20 bushels per acre, including the seed remaining in the unbound sheaves. In 1821 I had about 30 bushels, weighing 55 lbs. each, ground for my hogs, who ate it as eagerly as Indian meal, given to them at the same time. Both crops were sown about the 6th June, and gathered in the middle of August—they were sown after Indian corn—one year with one ploughing, and the other with two, and harrowed in, without any perceptible difference—the quantity of seed, half a bushel per acre—the average length of the straw, about 5 feet. I have this year sold it at one dollar per bushel for seed, which is much in demand.

Very respectfully, your's,

WM. COXE

JOHN S. SKINNER, Esq.

OIL ESSENTIAL, how obtained from Flowers.

Take a clean earthen pipkin or deep dish, in which place a layer of cotton previously steeped in some inodorous oil, as pure Florence oil, or the oil of the bene seed when fresh and tasteless. On this place a layer of the fresh gathered leaves of the rose, tube-rose, sweet pink, jasmine or other odoriferous flower or plant; over this layer place another of cotton which has been steeped in oil as before directed, and thus continue till you have filled the vessel with alternate layers of leaves and cotton, or you have the desired quantity, when cover it up closely, and let it stand for four or five days, when the oil will be found to have fully imbibed the odour of the leaves; then take them out, express the oil carefully from the cotton, and bottle it up for use.

OIL OF BALSAM OF GILEAD, how obtained.

This excellent family oil, which should be kept in every house, is made in the following simple manner. Put loosely into a bottle of any size, as many balm of gilead flowers as will reach to about one third part of its height, then nearly fill up the bottle with good sweet oil, and after shaking it a little occasionally, and letting it infuse a day or two, it is fit for use. It must be very closely stopped, and will then not only keep for years, but be the better for keeping. When it is about half used, the bottle may again be filled up with oil, and well shaken; and, in two or three days, it will be as good as at first. The most alarming cuts and bruises of the skin which are so frequently rendered worse by spirituous balsams, salves, &c. are completely cured in a few days, and sometimes in a few hours, by this incomparable oil.

A remedy for corns on the feet.—Roast a clove of garlick on a live coal, or in hot ashes, apply it to the corn, and fasten it on with a piece of cloth. This must be made use of the moment of going to bed.

ON THE ADVANTAGES OF SYSTEM IN BUSINESS.

BY THE EDITOR.

De Witt, the grand Pensioner of Holland, was for some years at the head of the Department of State, and shewed himself to be one of the most complete financiers the age could boast of. Being asked how he could find time to accomplish all his affairs, his answer was, in substance, that his whole secret lay in "doing one thing at a time." He did that first, which required first to be done, and completed one thing before he began another. In that way he not only finished whatever he undertook, but generally found leisure to compensate for the toils of the day by social converse, and innocent pastimes with his friends in the evening.

Gen. Washington was attached to system in business, and therefore generally successful in whatever he attempted. It has been said that he planned on his morning pillow the course of each day's proceeding; and very rarely deviated from such course, unless compelled by the occurrence of unforeseen, and uncontrollable circumstances. A farmer cannot do better than to imitate the example of these great men. He should, so far as is practicable, have his system of operations—every thing proper to be done on his farm and means of doing it, settled and determined in his own mind a considerable time before hand. His fields should be numbered, and a plan arranged, at least in his head, if not on paper, with regard to his crops, obtaining and preparing seed, necessary ploughings, implements, &c. &c. He should be able to give a reason for every step he takes, and every stroke he strikes, and so husband his strength and resources, as not to lay out a cent's worth of either without an assignable motive, which is at least satisfactory to his own mind. We would not, however, wish a man to be *so bigoted* to any system or plan as not to alter it as reason, observation and experience may dictate. There is some sense in the saying that "a wise man sometimes changes his mind, but a fool never does." What we would solicit is, that every cultivator should form a plan for managing his farm, which may serve as a *general outline* for his proceeding, to be altered or filled up as his circumstances, and increase of agricultural knowledge may dictate. We would, at any rate, advise every farmer before he rises in the morning to decide in the probable business of the day, and he may as well with "his heavy head," press his pillow, or "sit on his heels' antipodes in bed" till noon, as rise ever so early, and whirl about all the forenoon, like a hen with her neck twisted, or a pigeon with its head nipped.

Many a man labors hard, and remains poor because "he does not know how to set himself to work." There's Mr. Simon Shamaway, for example, will turn off work at a great rate, especially when he works by the job, but he requires a guide or overseer as much as a horse that is ploughing among corn needs somebody to ride or lead him. He commonly *works out at day's work*, but has a small farm of his own, in which he "carries on" so badly that he might as well be asleep as undertake to cultivate it. He has a sort of a barn or rather hovel, where he keeps or more properly starves two or three miserable animals every winter; and generally has to *work out*, to procure fodder to keep them alive in the spring. His place for yarding the

poor things, is on the top of a sort of a hump-backed piece of ground, with a brook on one side, and the county road on the other. Every rain carries the essence of the manure into the road or the rill; and every once in a while a violent shower sweeps the premises, floats off every straw, and leaves the whole, at least as clean as his house floor; and this Mr. Shamaway calls *neat farming*! If one undertakes to point out to Mr. S. the absurdity of such management, he is sure to be saluted with a volley of abuse against *book farming*; and "*gentlemen farmers*" who make manure in their closets, and undertake to talk about "*breeds of cattle*," when they can hardly tell a steer from a heifer.

This notable farmer, undertook to set out a small orchard. The piece of ground from which he was to make his fortune by making cider, contained about an acre, of a soil naturally good, but it had become *bound out* as the phrase is, that is to say, it was swarded with a turf as tough as a side of seal leather. Mr. Shamaway bought some apple trees from a neighboring nursery, and gave his note payable in work at hay time. By the bye, he was in a great hurry (as he commonly is) when he set about planting his orchard. He tore up the young trees in the nursery, principally by the aid of a strong arm and an old axe, cutting, slashing, twisting, breaking and bruising all before him. He then carted the mutilated (murdered I was going to say) plants to the place intended for an orchard, let them lay in the sun while he dug little holes for them about 6 or 8 inches square,—crowded in the roots, torne, twisted, doubled, crumpled up in a heap, left both tops and bottoms pretty much without trimming, and jammed, and stamped the earth about them as hard as possible, so as to save the trouble of supporting them by stakes—took no note of the point of compass, but, as often as any way placed the tree, so that the north part of it fronted the south, which of course deranged the whole economy of its vegetation. In this way, he soon got through with his job, and felt as proud, apparently, as Nebuchadnezzar, or any other great conquerer, when he had plucked up a whole nation by the roots, and planted a new colony with its harassed and half-alive population. The trees, however, were soon taken sick—most of them died—the rest never flourished, and our notable mismanager lost his time, his labor, his pay for the trees, and his prospect of an orchard. No wonder then that he not only sighed sorrowfully but groaned bitterly when obliged, the next hay time, to work (I forget how many days) to pay for his apple trees, which proved worse than nothing to him.

We have given the above as one specimen out of fifty which might be mentioned, of Mr. Shamaway's ill-directed activity, and often worse than useless labors. He is, however, a man of *science, in his way*; and knows as much as the common run of magistrates, who used to hang old women for witches. He makes the *Moon* his chief counsellor, and watches all her motions with as much solicitude as if his all depended on her waxing and waning. The *Signs* in the almanac are also very important matters with this great calculator. His seeds must be planted in such a time in the moon, or they will all run to stalk and vine; his hogs must be killed when the moon is on the *increase*, or his pork will *decrease* unconscionably when boiled;

his bushes must be cut in the *old of the moon* in August, when the sign is in the *heart*, because when the sign is in the heart, the bushes will lay it to heart if their heads are cut off. He will undertake nothing new on Friday, because that is an *unlucky day*, and his wife would more think of churning or making soap on Friday, than she would (good woman) of dancin' hornpipes on Sunday. When he sees the new moon over his left shoulder, it is "a *sartai sign*," he says "something or 'nother is a goin' to happen; I minded it that time when the old sow got into the tater-yard, the old cow broke her leg in the pole-bridge, and Jemmy like died of the measles." He thus lives in continual apprehension, watching the moon—his only counsellor,—and poring over signs in the almanac—which compose his whole agricultural library,—gathering his harvest of misfortunes before hand, and suffering as much or more from apprehension than from the sad realities of life. This man has some system, to be sure, but it is founded on things which have no foundation and what little knowledge he possesses is like the glimmering of a jack-o-lantern which points out and faintly illuminates the road to ruin.

From the National (Vermont) Standard.

LEGAL INTELLIGENCE.

The adjourned session of the Supreme Court in this county closed on the 5th inst. The laudable exertions of our present judges to contract the course of litigation, and clear the docket of long standing suits, has finally succeeded. Several adjudications of considerable consequence have been made. We shall take the liberty to notice the case of Hagar vs. Woodbridge, as a pre-eminent importance. This was an action commenced for the taking of stage horses, &c. which the plaintiff claimed under an absolute and unconditional bill of sale from Campbell the original proprietor. This sale was acknowledged to be founded upon a fair and valuable consideration. The possession of the property was considered as unchanged, although Campbell continued to run the horses upon the line under a lease of the same, executed simultaneously with the bill of sale, by which a certain rent per annum was stipulated to be paid to the plaintiff. The defendant claimed the property by virtue of the levy of an execution against said Campbell subsequent to the sale above mentioned. The case was argued on the part of the plaintiff at length, and with great legal ability. But the Court decided under all the circumstances that the sale to the plaintiff was fraudulent and void. They occupied the grounds taken in the case of Edwards vs. Harbin, decided in England, and Hamilton vs. Russel, decided by the Supreme Court of the United States, and recognized the broad principle that every bill of sale of personal chattels which are susceptible of immediate delivery unaccompanied by possession, was *per se* fraudulent against creditors, and that no proof of valuable consideration passing from the vendee could change the legal character of the transaction. They observed that the principle they had adopted afforded a definite and necessary rule to detect deceit in the transfer of personal chattels, and that to limit its operations by an investigation of the circumstances of each particular case would constitute a *felo de se*, and destroy its utility altogether. This decision was not however unanimous.

NEW ENGLAND FARMER.

SATURDAY, APRIL 19, 1823.

The Farmer's and Gardener's Remembrancer.

APRIL.

PLANTING TREES.—After your ground has been properly trenched, spaded or ploughed, till it is made perfectly fine and mellow, you may proceed, in the most judicious manner, and according to the best authorities, to plant your fruit trees, forest trees, &c. The tree to be planted should be as young as circumstances admit. Mr. Ficol, an English writer of reputation, states that generally trees three, or at most four years old from the seed, and which are from 2 to 24 inches high, will, in any situation or soil, outgrow those of any size under eight or ten feet, within the seventh year.* Mr. Cobbett says "If the tree be for an orchard it must be five or six feet high, unless cattle are to be kept out for two or three years. And, in this case, the head of the tree must be pruned short, to prevent it from swaying about from the force of the wind. Even when pruned, it will be exposed to be loosened by this cause, and must be kept steady by a stake; but it must not be fastened to a stake, until rain has come to settle the ground; for, such fastening would prevent it from sinking with the earth. The earth would sink from it, and leave cavities about the roots. When the trees are short they will require no stakes. They may be planted the second year after budding, and the first after grafting, and these are the best times."†

A great difference of opinion appears to exist respecting the time of the year best adapted to planting fruit trees. In Pennsylvania, the spring of the year is preferred. Ebenezer Preble, Esq., in a communication to the Mass. Agr. Society, says that he prefers autumn to spring for planting apple trees, as the ground will settle round the roots previous to the frost setting in, and be prepared to shoot in the spring, aided by the rains which prevail at that season. If planted in spring, he observes, the drought and heat of summer will injure, if not destroy them, before the roots find their place. He transplanted them as soon as the leaves fell in autumn, and farmers have generally more leisure at that time than in the spring.‡ Mr. McMahon says, "as the seasons for planting out fruit and other trees, differ so much in the climates of the U. States, and even in the same place, in different seasons, the only sure guide is, to plant all kinds of trees as soon as their buds begin to swell, or rather a little before."§ Mr. Cobbett says, "the season of planting fruit trees is when the leaves become yellow, or as early as possible in the spring."

When your ground is prepared, take up the tree with care without wrenching or tearing it. "Prune the roots with a sharp knife so as to leave none more than a foot long; and if any have been torn off nearer to the stem, prune the part, so that no bruises or ragged parts remain. Cut off all the fibres close to the roots; for they never live, and they mould, and do great injury. If cut off their place is supplied

by other fibres more quickly. Dig the hole to plant in three times as wide, and six inches deeper than the roots actually need, as mere room. And now, besides the fine earth generally, have some good mould sifted. Lay some of this six inches deep at the bottom of the hole. Place the roots upon this in their natural order, and hold the tree perfectly upright, while you put more sifted earth on the roots. Sway the tree backward and forward a little, and give it a gentle lift and shake, so that the earth may find its way amongst the roots, and leave not the smallest cavity. Every root should be closely touched by the earth in every part. When you have covered all the roots with the sifted earth, and have seen that your tree stands just as high with regard to the level of the ground as it did in the place where it before stood, allowing about three inches for sinking, till up the rest of the hole with the common earth of the plat, and when you have about half filled it, tread the earth that you put in, but not very hard. Put on the rest of the earth, and leave the surface perfectly smooth. Do not water by any means. Water, poured on, in this case, sinks rapidly down, and makes cavities amongst the roots; lets in air; mould and canker follow; and great injury is done.**

"If you plant in the spring, let it be as early as the ground will bear moving; only bear in mind, that the ground must be dry at top when you plant. In this, the new roots will strike out almost immediately; and as soon as the buds begin to swell shorten the head of the tree. After a spring planting it may be necessary to guard against drought; and the best protection is the laying of small stones of any sort round the tree, so as to cover the area of a circle of three feet in diameter, of which circle the stem of the tree is the centre. This will keep the ground cooler than any thing else you can put upon it.†

Mr. Forsyth says, "In transplanting trees, especially large ones, I consider it to be of great consequence that they be placed in the same position (that is, having the same parts facing the same points of compass) as formerly. If you take notice when a tree is cut down, you will find that three parts in four of the growth are on the north side."

With regard to the distance of each other, which apple trees should be planted, a variety of opinions have been entertained. Miller, an experienced English horticulturist, recommends, when the soil is good, fifty or sixty feet; and where the soil is not so good, forty feet. Lawson, another English writer, observes that in a good soil, and under proper management, apple trees will, in forty or fifty years, spread twelve yards on every side; and the adjoining tree spreading as much, gives twenty-four yards, or seventy-two feet, and the roots will extend still

* "The holes ought, for various reasons, to be made previous to the day of planting. If the season of planting be spring, and the ground and the weather be dry, the holes should be watered the evening before the day of planting, by throwing two or three pails full of water into each; a new but eligible practice."—*Thacher's Orchardist*, p. 52.

† It has been found by experience to be a good practice, in a light soil, to mix small stones with the loam about the root of the tree, in returning the earth into the hole. These stones help keep the roots firm in their places in high winds, and prevent the earth about them from being loosened.

further. He therefore recommends that apple trees be set at the distance of eighty feet from each other. Dr. Deane observed that trees in that cold and cloudy region [England] need every possible exposure to the sun and air. It should be considered at the time of planting to what size the trees are likely to grow. And they should be set so far asunder, that their limbs will not be likely to interfere when they arrive at their full growth. In a soil that suits them best they will become largest. Twenty five feet may be the right distance in some; but thirty-five feet will not be too much in the best or even forty.** We believe that the distance most generally recommended is forty feet in all directions. It does not answer a good purpose to plant small trees in the midst of full grown trees, nor to plant young trees where old ones have lately grown. An orchard should have a northern exposure, and it is said that the rows of trees in an orchard ought to incline to a point of compass towards the east, as such an inclination gives the trees the greatest benefit from the morning sun.

ON THE CHOICE OF TREES FOR PLANTING.—"It has been a received opinion, that the soil for a nursery should not be made rich, as the plants when removed to a more fertile soil, will flourish more luxuriantly; but late observation has decided that the reverse of this will be found correct. Where the soil is poor and lean, trees, in every stage of growth, are observed to be weak and stunted; while those reared in a good mellow soil always assume a free growth, and advance with strength and vigor."†

LOOK TO YOUR SHEEP AND LAMBS.—"See that the lambs can come at the teat; and if not, clip away the wool of the ewes which hinders them, as also all tags of wool on the udders of the ewes which the lambs are liable to take hold of instead of the teats.

"If a ewe refuse to let her lamb suck, she and her lamb should be shut up together in a close place till she grow fond of him. For this purpose, some say that surprising a sheep with a dog will be effectual.

"Care should be taken to feed the ewes plentifully after yearning, and with some juicy kind of food [potatoes are excellent,] so that the lambs may not fail of having plenty of milk. The rams may be gelded at any time from one to three weeks old, if they appear to be well and strong.

"They should not be weaned till they are six weeks, or two months old. At this age they should be taken from the ewes, and have the best pasture during the first fortnight; by the end of which time they will be so naturalized to living wholly upon grass that they may be turned into a poorer pasture.

"The worst woolled lambs, and bad colored ones, and those that are very small, should be destined to the knife, and not weaned."‡

"Should any deformed or lame lambs be found in your flock, or should any one be killed by accident, strip off the skin from such lamb, and cover with it either a twin lamb, or the lamb of a young ewe, which does not appear to be a good nurse, and shutting up the ewe that has lost her lamb, she will generally take it as her own. Should she refuse, she must be

‡ Deane's N. E. Farmer, p. 239; Wells & Lilly's ed.

held for a day or two, when she will adopt it. This is a common practice in Spain, where even half the lambs are killed, and two ewes given to each lamb. One of my neighbors tried it last spring, upon my recommendation, with success.*

ONIONS.—A spot of ground should be chosen for onions, which is moist and sandy; because they require much heat, and a considerable degree of moisture. A low situation, where the sand has been washed down from a neighboring hill, is very proper for them. And if it be the wash of a sandy road so much the better. The most suitable manures are old rotten cow and horse dung mixed, ashes, but especially soot. A small quantity of ashes or sand, or both, should be spread over them after sowing, especially if the soil be not sandy. And it is not amiss to roll the ground after sowing; or harden the surface with the back of a shovel.

"I have many years cultivated them on the same spot; and have never found the land at all impoverished by them; but on the contrary, my crops are better now than formerly. But the manuring is yearly repeated; and must not be laid far below the surface.

"The ground should be dug or ploughed in autumn, not very deep; and then made very fine in the spring, and all the grass roots, and of weeds taken out, then laid in beds four feet wide. Four rows of holes are made in a bed, the rows ten inches apart, and the holes in the rows ten. About half a dozen seeds are put in a hole, or more if there be any danger of their not coming up well, and buried an inch under the surface. Though the largest onions are those that grow singly, some inches apart, those that are more crowded produce large crops. And the middle sized onions are better for eating than the largest."†

"The same writer expresses an opinion that the drill method of sowing onions, may be preferable; and we believe it is generally preferred.

Mr. Cobbett says, "Let the ground be rich, but not from fresh dung. Make the ground very fine; make the rows a foot apart, and scatter thinly along a drill two inches deep. Then fill in the drills; and then press the earth down upon the seed by *treading the ground all over*. Then give the ground a very slight smoothing over with a rake.

"For seed, pick out the *finest onions*, and plant them out in rich land in the spring. To grow this seed upon a large scale, plough the land into four feet ridges, lay plenty of dung along the furrows, plough the ground back over the dung, flatten the top of the ridge a little, and put along, on the top of the ridge, *two rows* of onions, the rows seven inches apart, and the onions seven inches apart in the rows."‡

CUCUMBER.—To give particular and minute directions for cultivating cucumbers would seem rather a work of supererogation. We shall, therefore, content ourselves with the following quotation which may induce the inexperienced gardener to avoid a proceeding, which is much more common than proper.

"I have one observation to make upon the cultivation of cucumbers, melons of all sorts, and that of all the pumpkin and squash tribe;

and that is, that it is a great error to sow them *too thick*. One plant in a hill is enough; and I would put *two into a pot*, merely as a bar against accidents. One will bring more weight of fruit than two (if standing near each other,) two more than three, and so on, till you come to fifty in a square foot; and then you will have no fruit at all! Let any one make the experiment, and he will find this observation mathematically true. When cucumbers are left eight or ten plants in a hill, they never shoot *strongly*. Their vines are poor and weak. The leaves become yellow; and, if they bear at all, it is poor tasteless fruit that they produce. Their bearing is over in a few weeks. Whereas, a single plant, in the same space will send its fine green vines all around it to a great distance, and, if no fruit be left to *ripen*, will keep bearing till the white frosts come in the fall.—The roots of a cucumber will go ten feet, in fine earth, in every direction. Judge, then, how ten plants, standing close to one another, must produce mutual starvation."

COL. JACQUES' CATTLE.

On the 14th inst. some fine imported Cattle, belonging to Col. Jacques, of Charlestown, were exhibited in State-street, and it was allowed by all competent judges that they were the *best bred* foreigners that ever appeared among us. They were—the English bull Cælebs, and cow Flora, together with a very *promising* family, owned and bred by Col. Jacques, consisting of the Daisy, 2 1-2 years old; the Eclipse, 21 months; the Countess, 10 months; and Jupiter, 7 months.—Cælebs and Flora were purchased by Cornelius Coolidge, Esq. in England, and imported to Boston in 1813. Eclipse had been purchased previous to this exhibition for the Agricultural Society of Montreal, and the above mentioned was his *last appearance* in this part of the country. At 12 months of age this bull weighed 1060, at 15 months and 7 days, at Brighton Cattle Show, 1243, and at 21 months and 11 days 1502 pounds. At each time of weighing he was only in what is called common store keep. He has, however, never been particularly valued for his *weight*, but for his perfect symmetry, and being purely descended from the best stock in Great Britain. The Society of Montreal purchased him for \$500. He had previously won a premium of the Massachusetts Agricultural Society of \$40, and been admitted to a cow for \$10, making, in the whole, \$550, received for a bull about 21 months old! We are informed that Mr. Youl, an Englishman, the agent of the Montreal Agricultural Society in this transaction, and who was *professionally* acquainted with the best English breeds of cattle, spoke in high terms of Col. Jacques' stock, as scarcely to be excelled in Great Britain. We intend, hereafter, to take further notice of this breed of cattle, and to point out some of the advantages which may be expected to accrue from their introduction into the United States.

Pope's Threshing Machine.—We have published in No. 13, p. 99, of our paper, the opinion of the Committee of the Massachusetts Agricultural Society in favor of Mr. Pope's invention. Likewise in No. 35, p. 276, the report of a Committee of the Pennsylvania Agricultural Society, recommending the same implement. The last No. of the American Farmer contains a cut of the machine, with recommendations of a number of eminent agriculturists in Massachusetts and Pennsylvania. From these it appears, that with hand power it is capable of threshing five dozen sheaves of wheat in an hour, and that the same machine, with the applica-

tion of horse power, thrashes ten dozen an hour. That it thrashes much cleaner, and more expeditiously than is usually done by the flail or by horses. The har machine can be constructed at little expense; the materials cost \$13, and it can be made by a good workman in twelve days. Col. Powell, of Philadelphia, says, "It was exhibited to our Society—tried by the committee, and has been in operation before several of our directors and many other farmers (not Dilletant nor "book farmers,") who are not less satisfied than myself, that since it has been adapted to the power of one horse, it is, by its simplicity and cheapness, strength and force, better suited to our purposes than any thrashing machine which we have seen. It costs \$50, occupies but more room than a fan, thrashes 120 sheaves in an hour, and can be carried in a cart or taken to pieces at will."

Flax Machine.—A machine for dressing flax has been invented by Mr. Goodrell, of New York, and is now owned by Samuel Swartout, Esq. of Hoboken. A New York paper says that one man, with this machine, can prepare or clean more flax in one day than fifteen persons with the hackle; and the flax, thus dressed, is worth, and will command three cents more a pound in the market by the quantity.

Uncommon, but useful objects of Premiums.

In the list of premiums offered by the Executive Committee of the Hampshire, Franklin and Hampden Agricultural Society, we perceive the following, and are gratified to find the attention of New England farmers directed to subjects of this nature.

For the barn to be hereafter built, which shall be best calculated for the usual purposes of a barn, and especially for making manure by saving the urine of beasts,	\$100
For the second best do. do.	75
For the third best do. do.	50
For the best nursery of white oak, or white ash plants, raised from the seed, not less than three years old at the time the premium is adjudged, and occupying not less than an acre of land	100
For the second best do. do.	75
For the third best do. do.	50

In order to give every farmer an opportunity to contend for the ploughing prizes, the Executive Committee have thought fit to adopt the following arrangement: Four oxen and fifty minutes time shall be allowed for a quarter of an acre, reference to be had to the *quality* of the ploughing, only, if performed within the time.

Growth of Wood.—It has been ascertained (says an English paper,) that wood increases in the following proportion:—1st year as 1—2d as 4—3d as 9—4th as 15—5th as 22—6th as 30—7th as 40—8th as 54—9th as 70—10th as 92. From this it is concluded, that wood ought never to be cut till in the 10th year of its growth.

It is stated in a Liverpool Gazette, that any person who may swallow a pin, or the bone of a fish, will find almost instant relief by taking four grains of tartar emetic dissolved in warm water, and immediately after the whites of six eggs. The coagulated mass will not remain on the stomach more than two or three minutes, and in its ascent, it is said, will bring up the offending substance.

MEDICAL.

The use of Croton Oil, a powerful purgative, has been introduced in India. It is obtained from the seeds of the Croton Tiglium or Grana Moluca. One drop is the usual dose for a grown person, which, according to circumstances, is increased to two or three. It operates in from half an hour to three hours. It is sometimes taken in pills. One drop is equal to a drachm of jalap, or six grains of calomel, and an ounce of Epsom salts. It is sometimes called Narvallum Cotta.

* Livingston's Essay on Sheep.

† Dean's N. E. Farmer; Wells & Lilly's edition.

‡ American Gardener, par. 239.

Agricultural Societies.—There has been an attempt made in the Legislature of New York to repeal the laws of that State for the promotion of agriculture, and a bill for that purpose passed the House of Assembly, but the Senate refused to concur and the bill failed. The Board of Agriculture presented an able remonstrance on the subject, which is supposed to have produced some effect. A letter is given in this memorial, from M. Le Ray, De Chaumont, from which it appears that the Royal and Central Society of Agriculture of France has received the first number of the memoirs of the New York State Society, nominated a committee to examine it, and heard, with a lively interest and great satisfaction, the report made by it. In return M. Le Ray has sent, by order of the French Society, to the New York Society, 30 volumes, forming the whole of their Memoirs.

FOREIGN.

France and Spain.—These two nations are putting their armor, and assuming their hostile attitudes. It is a wonder if the other powers of Europe long remain merely lookers on, if the combat commences. Portugal, it is said, has resolved to act a part in the drama, and Great Britain, as an ally of Portugal, will probably become one of the characters.

Great Britain vs. Pirates.—Mr. Canning, it is affirmed, has announced in Parliament, that orders have been given, with the consent of Spain, to land troops in Cuba, for the destruction of pirates.

Paris accounts have been received to the 4th of March, and furnish details of discord in the Chamber of Deputies. M. Manuel, an opposition member, after being repeatedly interrupted, and cried down by the dominant party, was at length expelled. Refusing to obey the mandate of expulsion, he was at length carried out by force, the National Guards having been led in to carry into effect the decree of the Assembly. The people without showed much excitement in consequence of such cavalier treatment of one of their representatives, but their anger appears to have evaporated in clamor and menaces.

Spain.—Intelligence has been received from Cadiz late as the 7th March. The commencement of hostilities was hourly expected. The king was confined to his bed by indisposition, being threatened with an attack of the gout. The queen was said to be affected with convulsions. The Spanish Cabinet have declined to proffer mediation of Great Britain, which had for its basis some modification of their constitution, which might comport with the views in France. Spain is very where tranquil, and it is affirmed that danger is had the effect of uniting the people. Sir Robert Wilson has been appointed to the command of the Portuguese division, to operate against the French, in the event of their entering Spain.

Young Napoleon.—One of the London papers lately received at New-York, speaks of a rumor that General Demand, one of Bonaparte's best generals, is occupied at Barcelona, in Spain, is raising a corps of 10,000 men, composed of Frenchmen disaffected to the present government of France, whose object is, on the breaking out of war between France and Spain, to march to France under the tri-colored flag, with the view of exciting a revolution in that country, driving out the Bourbons, and placing young Napoleon on the throne as his father.

DOMESTIC.

Votes for Governor.—Returns have been received from 279 towns, which give Eustis 33397—Otis 29344. Out 25 towns remain to be heard from.

The election of city officers took place last Monday. In Josiah Quincy was chosen Mayor, and the following gentlemen Aldermen, viz:—David W. Child, Jeph H. Dorr, Enoch Patterson, Stephen Hooper, Jeph Benjamin, Daniel Baxter, Caleb Eddy, and Geo. Pierne.

The Hon. Judge Jackson has resigned the office of Justice of the Supreme Judicial Court, on account of the ill state of his health.

Hon. Josiah Quincy has resigned the office of Judge of the Municipal Court of this city.

Eclipse of the Sun.—It is stated in the *Harper's Ferry Free Press*, that, on the 27th June, 1834, there will be an eclipse of the Sun, to commence at 34 minutes after four, and continue 2 hours 55 minutes. Total darkness at 56 minutes after 5. There will not be another total eclipse of the Sun, visible in the U. S. until the 20th July, 1860.

A duel was fought on the 5th inst. near Philadelphia, over the Delaware line, between Gen. Cadwallader and Dr. Pattison, of Baltimore. The former was wounded in the wrist. The parties stood 9 paces or about 27 feet apart. The Gen.'s pistol was not discharged, as he was in the act of taking deliberate aim when the pistol of the Doctor was fired. Apprehensions are felt that a lock jaw will take place, as the arm is much swelled, and the ball is not extracted.

WASHINGTON, March 26.

Prairie Dogs.—The Rev. Samuel Giddings, of St. Louis, who took a tour among the Western Indians last spring and summer, gives the following account, in his journal, of these singular animals:

"June 14, 1832.—We passed a village of barking squirrels, or prairie dogs. They have the appearance of the grey squirrel in color and shape, but are three times as large. Their noise exactly resembles that of the smaller kind of dogs. They burrow in the earth, and are never seen far from their habitation. They live on grass and herbage; and not a spear of grass is suffered to grow within the bounds of their village. On the first appearance of danger, they flee to the mouth of their burrow, and when it comes near, they enter, and can rarely be driven out by smoke or water. Thousands dwell in the same village, forming a little community. Their burrows are from ten to twenty feet apart, with a mound of dirt at the entrance, of from one to two feet in height, which serves as a watch tower. On the approach of danger, they raise an incessant barking. We were much annoyed during the night by the barking of these animals."

Astronomical.—A beautiful Orrery or Planetarium, invented by Mr. Hart, principal of the Mechanics' School, in this city, is deposited for exhibition at the bookstore of Messrs. Bliss & White, in Broadway. Instruments of this kind are extremely useful, and indeed indispensably necessary, in illustrating the movements of the planetary world. Orreries and celestial globes are in the science of astronomy what maps, charts, and terrestrial globes are in geography. In either study the scholar's ideas must be confused and imperfect without the use of these artificial aids. The most beautiful Orrery we have ever seen was at Mr. Vogel's, opposite Washington Hall. It was connected with a time-piece, and the revolutions of the planets and their secondaries accurately measured by the machinery. Mr. Hart's invention is said to have been approved and adopted by some of the instructors in this city.

New-York Statesman.

PROPOSALS,

FOR PUBLISHING A VOLUME ENTITLED

COMPENDIUM OF AGRICULTURE, or the Farmer's Guide in the most essential parts of Husbandry and Gardening; compiled from the best American and European publications, and the unwritten opinions of experienced cultivators.

Now is the time when agriculture is making more rapid strides towards perfection, than appear to have been for ages. This may be attributed in some measure to the Agricultural Societies established in Switzerland, France, Britain and America. But we know of no work accessible by farmers in general, that contains a good concentrated account of these valuable modern improvements. The work proposed, therefore, has occupied the attention of the Editors a considerable time, and still demands the utmost assiduity in collating and condensing for the press—so that none of the recent improvements in rural economy should be omitted that might render it interesting and serviceable to the farmers of this country.

The Editors, (concerned themselves in rural affairs) fully apprized of the importance of agriculture, the first and most indispensable of arts, are determined to spare no pains to render it a really useful book to all who know how to appreciate such works.

The volume, to contain about 300 pages, 12 mo. at one dollar in boards, will be put to press when the number of subscribers shall be sufficient to encourage printing.

Those persons who have obtained subscribers for the above work, are requested to leave their names at the office of the Manufacturers' and Farmers' Journal, by the first of July next. Providence, April, 1833.

ENGLISH BULL.

FOR sale or to let, an IMPORTED BULL of 3 1-2 years old, of the Normandy breed (similar to the Alderney, only rather larger sized) and considered the richest Milkers in Europe. This animal is large, and very finely shaped, a brindle color and perfectly gentle. Price, One Hundred and Fifty Dollars; or if well placed, will be let on equal shares for two years.

Also—TWO BULL CALVES, from first rate Milkers, and a FULL BLOOD ALDERNEY BULL, owned by the Massachusetts Agricultural Society—will be sold for Fifteen Dollars each, if taken away immediately.

Apply to JOHN PRINCE, at his Farm on Jamaica Plain. Roxbury, 19th April, 1833.

On the sensibility of the Bonté Creation to the various changes of the weather.

WET weather seldom hurts the most unwise,
So plain the signs, such prophets are the skies;
The wary *Cow* foresees it first, and snails
Above the storm, and leaves the hollow vale;
The *Cow* looks up, and from afar can find
The change of heaven, and sniffs it in the wind.
The *Snallow* skims the river's watery face,
The *Frogs* renew the croakings of their race;
The careful *Ant* her secret cell forsakes,
And drags her eggs along the narrow tracks;
Huge flocks of rising *Rooks* forsake their food,
And crying, seek the shelter of the wood.
Besides, the several sorts of *Wat'ry fowls*,
That swim the seas or haunt the standing pools,
Then lave their backs with sprinkling dews in vain,
And stem the stream to meet the promis'd rain.
The *Crow* with clam'rous cries the show'r demands,
And single stalks along the desert sands.

VIRGIL.

GEN. WASHINGTON.

The following authentic letter from Gen. Washington, to Dr. Cochran, Director General of the American military hospitals during the revolutionary war, is extracted from the number just published of the London Magazine.

WEST-POINT, Aug. 16, 1779.

Dear Doctor—I have asked Mrs. Cochran and Mrs. Livingston to dine with me tomorrow; but ought I not to apprise them of their fare? *As I hate deception, even where imagination is concerned, I will.*

It is needless to premise that my table is large enough to hold the ladies—of this they had ocular proof yesterday. To say how it is usually covered is rather more essential; and this shall be the purport of my letter.

Since my arrival at this happy spot, we have had an ham, sometimes a shoulder of bacon, to grace the head of the table—a piece of roast beef adorns the foot, and a small dish of greens or beans (almost imperceptible) decorates the centre. When the cook has a mind to cut a figure (and this I presume he will attempt to do to-morrow,) we have two beef-steak pies or dishes of crabs in addition, one on each side of the centre dish, dividing the space, and reducing the distance between dish and dish to about six feet, which, without them, would be nearly twelve apart. Of late, he has had the surprising luck to discover that apples will make pies, and it's a question if, amidst the violence of his efforts, we do not get one of apples, instead of having both of beef.

If the ladies can put up with such entertainment, and submit to partake of it on plates, once tin, but now iron, (not become so by the labor of scouring,) I shall be happy to see them.

I am, dear sir, your most obedient servant,

GEO. WASHINGTON.

To Dr. JOHN COCHRAN.

Extract of a letter from an officer in the British army to his brother, at present in the city of Pittsburg, Penn., dated Secundrabad, near Golconda, East Indies.

"I arrived here after a march of five hundred miles through a delightful country. We encamped each day on the march, and were three months from Madras to this place. It would astonish you to see an army on its march through this country. The elephants are like

moving mountains; but they are the most docile of animals. A young one, about two years old, following its dam, being full of play, happened to throw down a child. The dam turned round, took up the child with her trunk, and having put it in a place of safety, beat the young one most severely.

"The pagodas, or places of worship, are some of them astonishing structures, and are from one to ten stories high. The sculpture of some of them would do honor to our modern artists. The natives are divided into castes. Some castes worship the elephant, others the cow, the sun, the fire, &c. but they all believe in a future state."—*Genius of Liberty.*

The Dog of Pera.—The house of a Greek interpreter at Pera, in the suburbs of Constantinople, being on fire, he had saved nearly all his property by the assistance of a few Janissaries, but more anxious, without doubt, for his money than for his family, he had forgotten an infant in its cradle. No one could enter the house, for every thing was on fire. The father, reduced to despair, believed that his child had perished; when, of a sudden, a large dog, which he kept to guard his dwelling, emerged from the flames, bearing the innocent little creature suspended by its linen from his mouth. They reached towards the dog to take the child, but he would not abandon it, and eluding their efforts, he ran through a number of streets, until he reached the house of an intimate friend of his master, where he deposited the precious burden, and remained till the door was opened to receive it.

Can you imagine what was the reward of this faithful and generous servant? The owner strove to recompense him—but the mode that he devised was equally absurd, afflicting, and incredible. With a barbarous gratitude he killed the dog, and had him served up at his table at a splendid feast which he gave on the occasion.

"My dog," said the Turk, "has behaved too well to be the food of worms. Men only deserve to eat him. And as for you," looking at his friends and relations, "you cannot but gain by it—it will render you more benevolent."

There is in this attested fact, more of barbarism than of feeling;—it would have been infinitely better to have caressed and taken care of his dog until extreme age, than thus to devour him like wolves. In India, a dog, after such an act, would perhaps have obtained a temple. This would have been, no doubt, ridiculous, but it is better to err by being over grateful, than to sin by the excess of ingratitude.

Mr. Curran was once asked what an Irish gentleman, just arrived in England, could mean by perpetually putting out his tongue. "I suppose," replied the wit, "he's trying to catch the English accent."

NEW GARDEN SEEDS.

FOR sale, by GEO. MURDOCK, No. 14, Market Square, a great variety of English and American GARDEN SEEDS, of the last year's growth; consisting of early Frame, Hotspur and Charlton Pease; early and late Cabbage; early and late Cauliflower; Sweet Marjoram, Thyme, &c. with every other Seed suitable for a Kitchen Garden. Also, 40 lbs. Mangel Wurtzel or Scarcity—100 lbs. Ruta Baga or Swedish Turnip—a quantity of Arnack or Carrot. March 29.—6w

PROPOSALS,

FOR PUBLISHING BY SUBSCRIPTION A COLLECTION OF

FUGITIVE POEMS.

MORAL, SENTIMENTAL AND SATIRICAL.

BY SELLECK OSBORN.

THE author of the articles which are to compose this volume, never wrote with a view to fame or profit; he merely obeyed the impulse of the moment. Of those which were sent to the press he seldom retained copies; and they were usually forgotten by him until recalled to his mind by public prints, which have often gratified him by flattering notice, but which have also frequently annoyed him by mutilations which were extremely mortifying. This last circumstance (beside private solicitations and other motives) has induced him to collect, with considerable pains, his scattered effusions, and to add some unpublished pieces; which altogether will have at least the merit of being genuine; and perhaps that of inculcating to the best of the author's capacity, good principles and amiable sentiments—excluding all matters relative to party politics. Disinterestedness is not pretended: It is confessed that a liberal patronage would be very acceptable, on various accounts. The author confides in the triennial of his friends throughout the Union, for the promotion of his interest in this case.

The volume will be neatly printed, in a duodecimo form of 200 pages, on handsome paper, with type entirely new, and well bound in boards, at one dollar payable on delivery.

A commission of 12 per cent will be allowed agents on all returns made.

Gentlemen holding subscription papers will please return them by the first of June next, or as soon as reasonable efforts have been made to obtain subscribers.

Editors of newspapers will oblige the author by publishing or noticing these proposals, and receiving subscriptions.

Communications to be addressed to the author Merchants' Hall, Boston, Mass. April 5.

THE STATISTICAL ACCOUNT OF SCOTLAND.

DRAWN up from the communications of the Ministers of the different parishes, by Sir JOHN SIMON CLAIR, Bart. 21 vols. 3 vo. complete, only one copy will be sold at the very reasonable price of \$50. Among 58 heads of inquiry addressed to each minister (the whole being too numerous for an advertiser as a guide for their reports, are—Name, and its original description of the soil and surface; climate and diseases; instances of longevity; mode of cultivation; implements of husbandry; manures; seed time and harvest; quantity and value of each species of crop; total value of the whole produce of the district; wages and price of labor; manufactures; man of kelp; police; roads and bridges; state of the Church, stipend &c. number of the poor; parochial funds and the management of them; schools, and scholars; number of souls; cattle, nature and value; sheep do.; swine do.; coal and fuel; antiquities; character of the people; advantages and disadvantages; means by which the situation could be meliorated. "No publication of equal information and curiosity has appeared in Great Britain since Doomsday Book; and that, from the ample and authentic facts which it records it must be resorted to by every future Statesman, Philosopher and Divine, as the best basis that has ever yet appeared for political speculation."

Also—The Complete Grazier, &c. 1 vol. 8 vo. American Orchardist—Cully on Live Stock—Farmer's Assistant—Farmer's Manual—American Gardener—Villa Garden Directory—Cox on Fruit Trees, &c. &c. For sale by R. P. & C. WILLIAMS, Cornhill Square, Boston. April 12.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but those who pay within sixty days from the time of subscription will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the Publisher) until arrearages are paid.

Agents who procure seven subscribers, and become responsible for the payment, will be entitled to copy gratis, and in the same proportion for a larger number.

FACTS AND OBSERVATIONS RELATING TO HORTICULTURE & DOMESTIC ECONOMY

BY THE EDITOR.

ON FOREST TREES.

As trees both for timber and fuel have become scarce in many parts of the country, it is time to pay a more particular attention to the preservation of wood lots and the planting of forest trees than we have heretofore. We all, therefore, offer some desultory remarks on this topic, premising, that as our object is *utility*, we shall not waste our time, nor that of our readers, by exhibiting models of labored but empty phraseology. What we wish is to be *understood*, and if we obtain the approbation of farmers, we shall mind the idle wind of critical carpers no more than the humming of a humble bee that "wheels his droning flight" from one head of clover to another. And first we shall say something in addition to what we have formerly said on the subject of planting trees, which will apply as well to forest trees to fruit trees.

In our opinion the Rock Maple, or Sugar Maple, is, on many accounts, and in many situations, to be preferred to any tree which is adapted to our soil and climate. For fuel, it is, really, if at all, inferior to walnut, and the value of its sap or juice is too well known, and is highly appreciated to require a syllable in its favor. We wish the borders of all our highways, where this tree will grow, (and it will grow in almost any soil except a mere swamp or a dry sandy waste) might be adorned with this beautiful and useful tree. But it will be well for those who undertake to plant this, as well as all other trees, to make thorough and correct work of it. There is nothing in which it makes greater waste, or negligence punishes the person who is guilty of it, in a more exemplary manner than in the planting of trees. That kind of labor is not well done, if it had never been altogether omitted. If you *half plant* a tree, your soil is cumbered, perhaps for years, with a *half alive* stock, a monument of the indolence and bad husbandry of the owner of the premises. We would as lief see dilapidated barn doors, rotten fences but three and a half feet high, or holes of broken windows half stopped with the ragged remnants of old petticoats, as ankered, worm eaten, blasted fruit or forest trees, dying by inches about a farmer's homestead. If a tree is badly set out, or stunted by mismanagement, when in its infancy, no subsequent art or attention will ever make it thrive. Therefore I tell you again and again, what you do, do well; for otherwise you may as well do nothing. You will then please to proceed according to our directions, page 301, unless you have some better method of your own. And if you have a better method please to communicate it for the New England Farmer, and we shall be happy to give it to the public, together with the name of the author, in our best style of capital printing.

There are many sorts of Maples enumerated by botanists, but the only kind which we should think it expedient to cultivate is the Acer Sac-

charinum, rock maple, or sugar maple. This kind of tree bears transplanting better than almost any other. It is true, we believe, in general, that it is better to take trees for planting from a nursery than from a forest. An able writer in the Massachusetts Agricultural Repository, vol. v, p. 36, affirms that "the practice of transplanting trees from our forests, of six or ten years growth, robbed as they must be of the greater portion of their fibrous roots, and suddenly exposed to a soil and air to which they have been unaccustomed, cannot be too much reprobated." The maple tree, however, will succeed better than almost any other under such treatment. All sorts of maple may, likewise, be propagated by cuttings. And if they be cut from the trees before the buds begin to swell, and before the ground be fit to receive them, they may be wrapped in moss, and put in a cool place, where they may be kept a month or five weeks without injury. These trees may also be raised by sowing the seeds, commonly called keys.*

In clearing land it is customary to reserve or leave standing some of these trees, especially if the land is intended for pasture. This may be a good practice, though it is not without inconveniences and danger. The heavy tops, exuberant foliage and long trunks of these trees expose them very much to the wind, and they are frequently blown over, turning up with their roots a large portion of the surface of the soil. From this cause it is often dangerous to permit cattle to range among maple trees, which obtained their growth in a forest, and are afterwards exposed in open land to the gusts of wind which so frequently accompany showers in the summer months. It is better, in clearing land, to leave small maples, or to protect and rear a second growth, than to undertake to preserve the ancient tenants of the forests. Trees which have ever been *accustomed* to free currents of air will put forth roots adapted to their exposure. Twenty or thirty trees to an acre of pasture will do but little injury to the grass, will afford a shade and shelter grateful and beneficial to cattle, and, six or eight acres thus stocked with rock maple trees, will afford a valuable sugar orchard. Mr. Bordley, in speaking of these trees says—"A grove of them, two or three acres, would give comfortable shady walks and sugar for family use; the making whereof would require but a short time, and be an entertaining harvest. The trees 30 feet apart, are above 43 on an acre; which at a low reckoning would yield 200 lbs. of sugar an acre, deducting only a trifle, not so much for labor as for a short attention in the leisure month of February.† From seeds it may be 20 years before the trees yield much sugar, but they soon form a delightful shady grove, and they grow readily from seeds. Instead of 43 trees there may be 43 clumps of three or more sugar maples in each clump. Sugar maples growing in fields, uncrowded, give 7 lbs. of sugar a tree; then clumps of four trees may yield 24 lbs. a

clump; and 43 such clumps may be reckoned to give 1150 to 1300 lbs. from an acre."*

We believe Mr. Bordley has made a large allowance of sugar in his calculations, and he says nothing of the fuel for boiling the sap; but still a sugar-lot may be made sufficiently profitable to become an object worthy of attention. And it should not be forgotten that the rock maple not only pays its annual tribute, in a delicious and wholesome product, but at the end of its term yields a more valuable species of firewood than almost any tree of the American forest.

Oak.—Mr. Miller says "Oaks are best produced from the acorns in the places where the trees are to remain; because those which are transplanted will not grow to so large a size, nor remain sound so long."† The author of the Agricultural Report of Scotland says, "Trees may be raised by sowing seeds on the spot where they are to grow. There are now many promising oaks among the plantations at Gartmore, which have sprung from the acorn dibbled into soil altogether unimproved." Again, he observes, "It is the opinion of physiologists, that trees have that portion of their nourishment, which they derive from the soil, conveyed to them by their minute fibres, which run in every direction from the root, called the *tap-root*, proceeding downwards in a perpendicular direction, and the use of which is to support the tree against the violence of the winds. In removing any tree from its first situation, *some* injury must be done to these fibres, and especially to the *tap root*; and the *oftener* the tree is removed the *greater* will be this injury. In this respect, a tree, which is permitted to grow in its original site has an advantage over the transplanted tree. In the same view, a plant taken from the seed bed, and planted but once, (instead of suffering a *first* transplantation to the nursery, and then a *second* into a plantation,) will surely have the best chance of success. And where is the impracticability of raising such plants? If the nursery man will only sow his acorns in drills, sufficiently wide to admit of hoeing, and thin the plants the first and second years after they have come up, by removing the more unpromising ones, he can by the third year furnish plants of sufficient growth, that have suffered no *previous* injury by removal from the seed-bed. Still, however, there appears to be something *contrary to nature* in removing a tree from the spot in which it had its origin."‡ This, however, must frequently be done from necessity, and if due care is taken in transplanting a young tree, but little if any injury is received by the tree which is removed. Some writers, however, maintain that two or three times transplanting a tree is necessary to give it a fair start. Every root and fibre, they say, which is cut off in order to prepare a tree for transplanting is succeeded by several roots and fibres, the number of *vegetable mouths*, by which the plant procures food from

‡ Agricultural Report of Scotland.

the soil is thus increased, and a more rapid and vigorous growth is the consequence. But in addition to the authority above quoted in opposition to the theory of digging up trees and cutting off their roots in order to make them thrive more abundantly, we beg leave to cite the example of *nature*. Trees planted by her hand in forests which have never been pervaded by human foot steps, have, of course, never been transplanted, but yet exhibit the largest and most perfect specimens of their kinds.

The acorns for planting oaks should be taken from the largest and most thrifty trees. They may be gathered as soon as they fall in autumn, and kept in a box or boxes of sand till the following spring. Then open them and plant such as have sprouted, allowing no time for the sprouts to dry.

TO THE EDITOR OF THE NEW ENGLAND FARMER.

I here enclose a treat, a literal translation of an ancient fragment, which I wish to see versified* and published in thy paper. During the summer of 1813, I was in Philadelphia, and hearing of a curious old German book called *Archimedes' Work Shop*, after some trouble, I obtained the loan of it for some months. It was an uncommonly large folio, printed in Nimwegen, in 1661. It was principally composed of plates, of which there were upwards of three hundred. The language was obsolete German and Latin, with some Greek, and required the study of the most learned men in the city to read it. The plates were intelligible, and it appeared to really be the work of Archimedes. There were drawings of various kinds of Machinery, which he took in travelling through Egypt, such as Joseph's Well, 300 feet deep, and 600 wide, cut through a rock, with winding stairs, and water drawn from one reservoir to another by screws. He said that at the building of Thebes the sciences were better understood than in his time. The learned Divines were anxious to know his religion, or ideas of the *Supreme Being*; therefore by resorting to old lexicons the enclosed translation was made.—There is no imposition—it is genuine. I wish to see it versified, and published in your paper, in order to show the ideas of this eminent philosopher with regard to the SUPREME BEING, and the necessity of labor.

SAMUEL PRESTON.

Stockport, Pa. April 3, 1823.

A LITERAL TRANSLATION OF ARCHIMEDES' HYMN ON THE STRUCTURE OF GOD'S WORKMANSHIP.

1. The great God hath drawn in wisdom the high arched circumference of the world;
2. And has by his knowledge ordered every thing one against the other.
3. He has placed water against the land; the hill against the dale;
4. And, indeed, without any trouble or labor of his hands.
5. Soon as he spake the word was every thing completed, which he designed;
6. And in so masterly a manner, that whosoever thinks of it is astonished and lost in wonder.

* We hope our friend will excuse us for not attempting to versify the sentiments of Archimedes. We believe the ideas of the author can be more *exactly* given in prose than in verse; besides, we have no leisure, at present, to give them a metrical form. If any of our friends or correspondents will clothe them in a poetical garb, we shall esteem it a favor.

7. But as he himself first appeared this globe,
8. So has he also implanted a part of the godhead in man,
9. As the image out of which he himself looks, and sends forth rays of his power from his eyes.
10. Hence the earthly man, he whose origin is clay, is so divinely enlightened and celestially exalted,
11. That he, soaring after his Creator, obtains the spirit of wisdom, and brings to the light of day many of the works of art.
12. Thus has God created this out-work of the world, with its appurtenances, and beautifully ornamented all things.
13. So man builds in the world no otherwise than as if he were a journeyman in God's great work shop.
14. He searches heights and depths, how hills and valleys arrange themselves, in wonderful and uninterrupted continuation, surrounding one another, even as the elm and the vine.
15. His omniscient mind compels the drought and moisture to do whatsoever he commands them.
16. Nevertheless, for all things which man can perform, there is required time and pains.
17. These things cannot be immediately performed.
18. What God can effect by his command will not forthwith be done by the mere word of man.
19. Art has her right, she can indeed subdue all things, and what appears impossible, she can, notwithstanding, accomplish.
20. Yet does she require many an hour and great industry, until she seems sure of her aim, according to her wish.
21. The noble palaces in which princes dwell can never be raised while we shun the requisite labor, but will come short of being finished.
22. Without an unwearied hand the artist will never acquire glory.
23. The floods which pour their waters into the deep vallies are not by nature accustomed to flow up hill;
24. But obedient to the power of art, which forces them towards the heavens, they spring, as it were, to the clouds, from the lowest depths.
25. Yet, nothing is done without toil. The strong current of water must, as it were, be compelled by computation, by number, weight and measure, which does not err in the least, and by much manual labor to ascend aloft.
26. How all these things are to be performed, according to art, is here notified to be seen in this Book; in it are produced to view the rudiments of those arts, which Europe keeps concealed.

It appears that when Archimedes wrote this book he was in Egypt. The hymn was in 26 stanzas, in long lines.

TO THE EDITOR OF THE NEW ENGLAND FARMER.

I have known the following experiment tried for the purpose of killing bushes and improving worn out land, and the result has much more than equalled the anticipations of the owner. Should you deem this worthy of an insertion in your paper, you are at liberty to make that use of it; otherwise you may dispose of it as you do of other useless communications. Previous to the season of 1818, the bushes, on a lot, containing about three and an half acres, had been mowed, annually, for three or four years, without perceptibly diminishing their number. During the May of this season, about a bushel of plaister to an acre was sowed on the whole lot. Towards the last of June clover began to make its appearance among the grass and bushes, and wherever the bushes were formerly the largest, the clover grew, and still continues to grow rankest. Notwithstanding cattle ran in the lot several days in June, by the middle of July it afforded a crop of the first year's growth of bushes and clover, equal in value to the profit of either of the ten preceding years. Since then, the crops have continued to increase both in quality and quantity, and

the bushes are now almost exterminated. The killing of the bushes with much less labor an expense than in any other way with which I am acquainted, is not the only advantage derived from this method of improving pastures; the shrub apple trees which abound in almost all old pastures can, by engrafting them and keeping cattle out of the lot, easily be made thrifty and soon, bearing trees, which has been done in the above case. As circumstances permit nearly a correct estimate of the improvement in the value of the mowed crop. I will state that ten years since this lot was leased for three dollars, and that the present owner has been offered twenty five dollars a year for the grass the two last years; thus affording an increase of profit of more than eight to one. This has been effected with less than one load of manure and but two dressings of plaister. Should any one object to trying this experiment even on a small scale, on account of his land's being too bushy, I can assure him that some part of the lot would, a few years since, compare with the worst. The stones, except the most prominent will gradually disappear by the rotting of the fallen growth, and the land becomes much more smooth, than most people would suppose at the first thought. A similar experiment has been commenced on a lot of twenty acres, and with a prospect as yet of as complete success as the former case. From experience I have been induced to believe that mowing lands without letting cattle on them at all, is the cheapest as well as the most effectual way to kill bushes and frequently far more profitable. No one could for a moment but that feeding is to bushes what weeding is to corn, and that the closer a pasture is fed the less the obstruction is to the growth of the bushes, as they are always left untouched.

FOR THE NEW ENGLAND FARMER.

MR. FESSENDEN—I have seen in your excellent paper, the use of Lime often highly recommended to the practical farmer as a manure. It is said to be very useful in order to prepare green or long manure for immediate use. Would it not confer a favor on your patrons, some one, who is acquainted with the use of the operation of lime, would communicate through the medium of your paper, the manner and quantity which should be mixed with a load of green manure, and also how long after the manure before the straw and stubble will be decomposed and fit for use?

A SUBSCRIBER.

Livermore, Maine, April 19, 1823.

FOR THE NEW ENGLAND FARMER.

I have noticed with satisfaction the remarks of my venerable worthy friend, Col. T. Pickering, respecting the strength of Timber, in No. 32 of the New England Farmer. The strength and duration of timber are certainly an interesting subject to farmers; and as the lands are cleared up, and timber becoming scarce, it will become more so.

It is not a subject that will admit of mathematical demonstration; observations and experiments are all the evidence that we can have. As I have formerly been accustomed to working in wood, and from an early period of life paid attention to the subject, and the observation

ad directions of men of more age and experience, I make a few remarks in hopes it may induce others to communicate more full and correct information.

Since my memory, there was living in the neighborhood of the place of my nativity. Bucks County, Pa.) a very worthy and respectable character whose name was ALEXANDER BROWN. He was more curious, particular, and exact in every thing he did, or had done, than any other man. He gave rise to a saying, "More nice than wise, like Alexander Brown."

In his early days, before saw mills were erected, his business was to go about with a company of hands, and do the sawing for the buildings, with whip saws. A large landed patrimony falling to him, he cleared up several farms for his sons, and erected several substantial buildings. His life was more devoted to experiments than lucrative speculations. He used to say that the nerves and strength of old trees, like those of old men, began to fail gradually, any years before they died; and that for all his buildings or fences he only took such timber as he termed in the vigor and prime of life; and all his timber for fences, or other uses, he would have felled in February, when the ground is hardest frozen, saying then there was the least sap in the pores to corrode and rot the wood. He never would suffer a post set in the ground except top end down; but said posts split out the same cut, set with the top end in the ground, would last three or four times as long as those set butts down. In splitting the posts, if any were too small at the top to set in the ground, he would not use them as posts. In making fences, every rail must be put heart side up, and this gave rise to another saying, viz: "As durable as Alexander Brown's fences." He died at a very advanced age, during the revolutionary war, highly esteemed as a truly honest and useful man, having been for many years considered the oracle or pattern for all the best farmers in the circle of his particular acquaintance.

The next man I shall mention of great observation and experience in the strength and direction of timber, is THOMAS ELLICOTT, noted as the most ingenious Millwright of his time. With him I was intimately acquainted; he followed building and repairing mills and waggons on a large scale, successively, for forty years. He has felled timber for his purposes. As to the proper season, he was a disciple of Alexander Brown. White oak timber, for waggons or mills, was all felled in February, when the ground is hardest frozen. His rule to select the strongest and solidest wood was to cut into the trees and take those of the largest growths. If by splitting in, the growths near the bark were smaller than the others, he considered the wood declining, and rejected such trees. He never used more than about twelve feet of the straightest part for waggon wheels; then generally came saw log for mill works. His better mode of seasoning his timber for the most strong durable work, was, at first, soak it three months in a pond of water, to take out the sap, and prevent what they call "powder posting," or being eaten with small worms. Such was the practice of Thomas Ellicott, founded on accurate observation and extensive experience. He never would cut timber for his business, only when hardest frozen in the winter, except small tough white ash, for *Cradle fingers*. He

found, by experience, that kind of wood tempered best for that purpose, if cut down when full of sap, and the bark loose.

As perhaps every farmer may not know how to make cradle fingers in the best and readiest manner, to the exact crook of the scythe, I will give the simple process. Lay the scythe on a plank or slab, and mark round the back of it with chalk; bore a row of holes on each side the chalk, at a proper distance apart, to take in the fingers, when rough shaved out; put pins in the holes, and it is the mould to set the fingers. Take the but of a small white ash, say four or six inches diameter, the straighter grain and larger growth the better; split it into suitable pieces, carefully marking exactly on the ends which side was next the heart; then shave them down square, nearly to the size, so as by the square they will all bend exactly from the heart, for all such young wood naturally inclines to spring from the heart. Make a fire of hot embers and ashes by the water—run them in the fire, and dip them in the water and fire alternately until they are heated through. They will then be very limber to put in the mould. As soon as they are dried through, they are fit for use, and if properly treated will never incline to spring back—will be easier and smoother dressed than crooked stuff, and being straight grained are stronger and may be dressed smaller.

I now wish to hear a statement of the nature and properties of Timber in the Eastern States, for I believe there is a difference in the nature of timber in different ages and climates.

SAMUEL PRESTON.

Stockport, Pa. April 10, 1823.

From the American Farmer.

CULTURE OF SWEET POTATOES.

Hopkinsville, Ken. Jan. 30, 1823.

J. S. SKINNER, Esq.

Sir—In the American Farmer, of the 3d inst. I find an inquiry, as to the kind of manure best adapted to the raising of sweet potatoes, and the best kind of culture, to insure a great crop. I readily agree with the inquirer, that this is a most valuable vegetable, and has been too long very much neglected. Yet I make no pretensions to answer his inquiries on this subject; but only to state a few facts, giving a brief detail of my own mode of cultivating this root.

I will premise that any increase of crop was not ascertained by actual admeasurement, but only by the eye, when viewed in bulk, and a larger root for several years in succession, after my mode had been fairly tried.

The first step in the process, is to enclose the lot intended for your sweet potatoe crop to itself. Your ground is, of course, to be next ploughed; and here I will remark, that for no crop is deep tilling more necessary. When your ground is thus prepared, throw it into ridges, three and a half feet apart, with a large bar share plough, causing the upper points of the two meeting furrows, to come within two or three inches of each other. On top of these ridges lay your plantings one foot apart, each planting forming a triangle with the two preceding, then cover them with a hoe, pulling up the earth from between the ridges. It is desirable to cover them with rich mould; if the planting is embedded in a clay covering, it does not vegetate so quick; consequently the root

is more apt to perish. This ridge, when it is covered, should be as high as a large potatoe hill. This mode of putting in your crop, together with the subsequent culture, will be found, upon trial, to take far less labor than the usual method of making and planting in hills.—The chief of the tillage, until you come to hilling, may be done with a light one horse plough. But the greatest saving of labor is in gathering your crop; which is performed after throwing the vines in a line between the ridges, then with a plough, throwing one third on each side of each ridge on the vines. Nearly all the potatoes will be left in the remainder of the ridge, which are to be thrown in baskets, and conveyed immediately to your potatoe cellar, which ought to be uncovered every day until they are done sweating.

The chief advantage, however, which I promise myself is the subsequent use I make of my potatoe lot. Those who prefer the old mode of management, may still pursue it, and derive the same advantage in giving their ground an aptitude for the growth of this root. Nothing is necessary to insure an annual increase of crop, the seasons being equal, than as soon as you get your potatoes off the ground to turn in your hogs intended for slaughter, and there to fatten them until they are ready for slaughter. I have known a good crop made where this plan had been pursued in a very dry season, when not a single neighbor, without it, made any.

If you deem the foregoing worthy of being presented to your correspondents, you are at liberty to do so. Your's, &c. A. Z.

NOTE.—You will perceive that I have not attempted any reasoning on the foregoing; no doubt, the chief benefit is by the deep rooting of the hogs, and consequent action of frost upon the earth—moreover, some manure is deposited.

TO REMOVE VERMIN FROM CATTLE.

I have found that a small decoction of tobacco, washed over a beast infested with vermin, will generally drive them away; it sometimes makes the beast very sick for a short time.

But a better remedy is to mix plenty of strong Scotch snuff in train oil, and rub the back and neck of the creature with it, which will effectually kill or drive away all vermin from a quadruped. MIDDLESEX.

To the Editors of the N. Y. Statesman.

DANVERS, (Ms.) March 30, 1823.

I observed in your paper of Oct. last a paragraph from a Cincinnati correspondent respecting the cultivation of woad. I have the last year cultivated this plant on about five acres, and had three good crops, considering the season, the autumn being dry. We use it with indigo upon our best wool. I see no good reason why the indigo shrub will not thrive here, and perhaps it may be used green or dried by our dyers in cases of necessity.

Our supertine merino wool is as good as any from Spain, and I have seen better and softer cloth made from American wool than some imported, at \$1.25.

How to extract poison from a rusty nail.—Take a bean, and after splitting it apply one half (flat side) to the wound, bind it on. let it remain till it comes off itself, and the poison will be extracted and the wound healed.

DESCRIPTION OF A BRUSH FOR DESTROYING
"CATERPILLARS' NESTS."

To the Corresponding Secretary of the Massachusetts
Agricultural Society.

DEAR SIR—For the last three or four years, we have here had very few caterpillars. Last week I observed an increased number, though not many, on my young apple trees. How to destroy them *most easily*, was a question which occurred as often as I have seen orchards infested with them: while I always considered it disgraceful to a farmer to suffer his trees to be stripped of their leaves, and their fruit, for that season at least, to be destroyed; seeing it was very practicable to get rid of them, and without much trouble, by crushing them, when small, with the fingers. This was my father's mode, when I was a boy. The same long, light ladders, which served in autumn in gathering his winter fruit by hand, enabled one to come at most of the caterpillars' nests in the spring. On this effectual example I have myself practised, since I became a farmer. Some over delicate persons might object to this mode: but it is really far less offensive than the bare sight of large and numerous nests with which apple trees are sometimes filled. And if the operation be performed early, when the caterpillars are only from a quarter to a half an inch long, the operator (man or boy) will feel no repugnance to the process. But in full grown trees, some nests towards the extremities of their small limbs would escape, because not accessible by ladders. A narrow brush, formed with small bunches of bristles in a single row, I once thought might reach and destroy them; but it was not found effectual nor convenient. Last Saturday morning the idea of the proper kind of brush occurred to me, and in the forenoon I tried it with complete success.

I presume every farmer has observed, that the clusters of eggs producing caterpillars, are laid round the slender twigs of the apple tree and wild cherry, and effectually guarded by a gummy covering, until vegetation commences in the ensuing spring. When first hatched, the worms appear about the eighth of an inch long. The same warmth in the air which opens the buds, hatches the caterpillars to feed on the embryo leaves. Their first object is to provide for themselves a tent for shelter, in their new state, against the inclemencies of the weather. For this purpose, they crawl to a small fork of a limb, where the branches form a sharp angle; and there spin and weave a web with which they surround it, and where they are secure against undue cold and heat and rain. By this small white web they are discovered, and are then most easily destroyed. But the clusters of eggs are not all hatched at the same time. According to their situation for warmth or coolness, they are hatched some days earlier or later. At the distance, therefore, of a week or ten days after the first visit, an orchard should be again inspected, and all the latter broods destroyed. If neglected in this first state, they soon, by their growth, become straitened for room; and having also consumed the nearest forage, they march and take a new station, and there form a new and more ample tent. By such neglect the mischief of their ravages is increased, and they are with more difficulty destroyed.

The efficient and convenient instrument above mentioned, for this work, is nothing more

than a common bottle brush fastened on the end of a pole. Having an old one in my house, I was enabled to make the experiment on the day when the idea of so applying it occurred to me. This brush is made of hogs bristles, introduced between two stiff wires closely twisted: and being convenient in cleaning the insides of bottles, is probably familiarly known whenever liquors are bottled. For the information of others, I will mention, that a piece of wire full one tenth of an inch in diameter, about three feet long, doubled, and leaving a small loop in the middle, is closely twisted for the length of about eight or ten inches from the loop; and then the bristles, being introduced between the remainder of the branches of the wire, and these closely twisted upon them, the bristles are immovably fixed; and thus form (after being uniformly sheared) a cylindrical brush about six inches long and two and a half in diameter. To fasten this conveniently to a pole, with a small gouge I made a groove about seven or eight inches long at the small end of the pole, in which nearly all the handle (the naked portion of the twisted wire) of the brush was laid, and bound on with three strings.

In using the brush, press it on the small nest, and turning the pole in the hand, the web is entangled with the bristles, and removed: otherwise, you rub the fork of the limb, inside and outside, with a brush, when nest and worms are surely killed or brought down. That the experimenter may see its mode of operation, he may apply the brush with his hand to a nest within his reach. Spruce poles are eligible, because that wood is light and stiff. For my small trees, I found a common bean pole (used for running beans to climb on) six or seven feet long, sufficient; and for them a longer pole would be inconvenient. For taller trees, poles proportionably long must be provided.

If you are satisfied, by my account, of the utility of this simple instrument for destroying caterpillars, you may think it proper immediately to make it publicly known. Should the description be more minute than is requisite for communicating a clear idea of it, and its application, you will abridge it.

With very great respect and esteem,

I am, dear Sir, truly yours,

TIMOTHY PICKERING.

The following remarks on the subject of Agriculture are from the New York Statesman. They were occasioned by an attempt to repeal certain acts by the New York Legislature, making appropriations out of the treasury for the promotion of Agriculture.

We have never entertained but one view of the expediency of the appropriations heretofore made for the encouragement of agriculture; and that has been decidedly in favor of the liberal policy of the government. The agricultural Societies, instituted in the several counties of the state, in consequence of the munificence of former legislatures, have already been of essential service to the community, and results still more important may be looked for in a few years, if these valuable institutions shall continue to receive the patronage and support of the state. We do not hazard much in asserting, that greater advances have been made in the cultivation of the lands, in the breed of cattle and horses, and in domestic manufactures, since the establishment of the Board of Agri-

culture and Agricultural Societies, than had been for the twenty years previous.

In many parts of the state, the face of the country has assumed an entirely different aspect. A generous emulation has been excited among the farmers. Agricultural science, improvements in rural implements, the successful experiments of others in introducing new modes of tillage, new varieties of vegetables and fruits, and generally, the most effectual means of increasing the productiveness of the earth with the least labor and expense, have become the common topics of conversation. The spirit of inquiry has gone forth; antiquated and laborious modes of cultivation have been examined and exploded; prejudices which had become inveterate by long usage have been corrected; and a system of rural philosophy and domestic economy has been introduced.

Independent of the immediate benefit to agriculture, arising from the influence of the societies, they have had a salutary effect on the community by increasing the general stock of knowledge. A vast body of useful information, topographical and statistical, has been widely circulated through the state, in books, pamphlets, anniversary addresses, reports, and newspaper essays. The varieties of soil, the productions, and resources of the several counties of the state are much better understood. Farmers have become more accustomed to reflect, and reason on subjects relating to the profession; and the general mass of intelligence has been greatly augmented.

The competition excited by annual exhibitions and awards of premiums has led to habits of greater activity and industry in both sexes. All classes have been stimulated by a laudable ambition to excel in agricultural knowledge and skill, in rural wealth and rustic honors. Cattle Shows and Fairs are regarded, not as mere holidays for relaxation from labors and as seasons of festivity, but as the fields of fame, where the farmer contests the rewards of ingenuity, industry, and superior merit, and wins for his brow a wreath of victory, not less honorable, and far more useful to society, than the bay of the scholar, or the laurel of the soldier. The labors of the housewife, and the products of the husbandman are on these occasions exhibited in triumph, and the fatigues of labor in some degree compensated by the meed of public distinction and applause.

Another benefit derived from the institution of these societies has been the increased popularity of agricultural pursuits. The profession of the farmer has been rendered more respectable and more fashionable than formerly. Men of talents and of wealth have turned their attention to agriculture, and are now engaged in experiments for the promotion and improvement of the science. The efforts of these wealthy and public spirited individuals have already been attended with the happiest effects.

We have been surprised that the members of our legislature, with the experience of other countries and other states as well as that of our own before them, should again attempt the abolition of societies, from which such obvious and important advantages have been derived. The proposition is the more singular at this time when *Agricultural Schools* have been projected the objects of which are in most respects similar to those of the institutions now in existence.

we were happy to see new plans proposed: the benefit of the agricultural interest.—they would doubtless be attended with great practical utility. Much has been done by the government for the other interests of the community. Scientific, literary, and other institutions have been munificently endowed and liberally patronized; while, till lately, very little has been done for agriculture, and it is now opposed to withhold even that pittance. A policy so short-sighted and narrow in its views could seriously injure the reputation which the state has acquired both at home and abroad, for being foremost in the great system of internal improvements, now rapidly extending throughout the country.

MUSTARD, HOW MIXED.

Boil a sufficient quantity of horse radish in the best white wine vinegar, add to it half as much mountain or good raisin wine, and a little refined sugar; then make it up to a proper consistency with the best unadulterated Durham flour of mustard, stop it up close, and will keep for years. Mustard thus made has an inconceivably fine spirit and flavor. Common keeping mustard may be made by only substituting water for the vinegar, with or without garlic, and a little salt. The flour of mustard should be gradually mixed with the boiling water or vinegar, to a proper thickness, and rubbed perfectly smooth.

HOW TO RAISE TURKIES.

Plunge the young chick into a vessel of cold water, the hour, or if that cannot be, the day it hatched. Force it to swallow one whole pepper corn, then return it to its mother. From that time it will become hardy and not fear the cold. When young turkeys begin to droop, examine carefully the feathers on their rumps, and you will find two or three, whose quill part is filled with blood. Upon drawing these the sick recovers, and after requires no more care than is bestowed on any other poultry.

TO ALL WHOM IT MAY CONCERN.

CORSETS.

Mrs. Deshang of Bethany in New Jersey, as the mother of three amiable daughters highly accomplished and beautiful; the young ladies have long been in the habit of lacing as tight as any of their neighbors; one has become quite infirm and the other two evidently droop. The alarmed parent stated the situation of her children to her old friend the venerable Dr. Allen of Philadelphia, who soon after the receipt of her note, forwarded the following reply.

MADAM—The case of your charming daughters affects me, and my whole experience may be put in requisition to assist them; that they were healthy, robust, and fine children, I perfectly recollect, and that their healths are now impaired may perhaps be solely ascribed to themselves. Fashion destroys more females than fevers. From a mistaken notion of bettering the best work of Heaven, the infatuated world risks health and even life itself. I deem the corset of the present day to be a perfect engine of torture, and worthy the Inquisitions of Inquisition, and Rome, and infinitely worse than the days of time gone by. These last be sure were

injuriously, but they left the resemblance of a female shape: the corset on the contrary presents the waists as regularly round and untapering as a white lead keg. The olden stays I remember were laced with a silken string, of the size of the finest twine, but the corset requires a cord equalling the bow string of a Kickapoo Chief. The antiquated hoop was of formidable expansion, and when first thrown upon the public eye created no trivial sensation—but in itself it was perfectly harmless, there was no compression about it; and the lady abode as safely within its ample circumference as the sentinel in his box. Every dog will have, and every fashion must have its day; the reign of the corset has endured about as long as the reign of Bonaparte, and like the latter, fatal enough in all conscience. I anticipate the happy period when the fairest portion of the fair creation will step forth unincumbered with slabs of walnut and tiers of whalebone. The constitution of our females must be excellent, to withstand in any tolerable degree the terrible inflictions of the corset eight long hours of every day, or the horrible total of 178,200 minutes in one year. No other animal could survive it. Take the honest ox, and enclose his sides with hoop poles, put an oaken plank beneath him, and gird the whole with a bed-cord, and then demand of him labor. He would labor indeed, but it would be for breath. Splinter and belay a pig in the same way, and a whine might be aspirated, but it would be a whine of expiration.

But I fear I am trespassing too violently on your patience, and in pity to you conclude with the old Caledonian motto, "Spero meliora."

Yours, GALEN.

NEW ENGLAND FARMER.

SATURDAY, APRIL 26, 1823.

The Farmer's and Gardener's Remembrancer.

APRIL.

PRUNING TREES.—It is now, we believe, about the right time to prune your fruit trees, and such of your forest trees as it may be worth while to subject to the operation. Col. Pickering assures us that his "practice has been to prune in the spring, beginning when the buds have scarcely begun to swell; and ending before the expansion of the leaves." That is, commonly, in this climate, from about the 10th of April to the middle of May. A writer in the Massachusetts Agricultural Repository, vol. v, p. 121 to 127, accuses N. E. farmers of some very bad management with regard to this department of rural economy. He says "it is a universal practice among the old farmers to mount the tree with a hatchet or bill hook, and hack off any branch which is in a state of decay, or which is misplaced, about six or eight inches from its insertion, leaving a stump to rot, and to operate as a conductor of the water, frost and canker into the mother branch in which it grew, or into the body of the tree according to its situation. This was done originally from an idea that if you cut close to the mother branch, or to the body of the tree, the rot or canker will seize more readily on its trunk, than if cut at a distance, and that the tree will decay the sooner. This practice has been followed without reflection, and without reason by many, but the error is so obvious that any man of obser-

vation may see it yearly; and any one who doubts may satisfy himself in one season of the incorrectness of the practice, by making his experiments on a young tree."

This writer advises the orchardist, when he has fixed upon a limb to be lopped off, if it is large and heavy, to cut first at some distance from its insertion, to prevent its weight in falling from lacerating the bark of the shoulder, whence your final cut is to be; because this leaves an opening for water to get under the bark, and cannot easily be healed.* You may now saw the stump close to the branch from which it proceeds with safety; or if it be a portion of a branch which is to be lopped off, the cut should be down to a sound, healthy, lateral branch, growing from the same limb; or if the limb to be cut off proceeds from the body or trunk of the tree, then it should be sawed close to the shaft. The wood in all cases should be smoothed over, and the edges of the bark carefully pared with your knife or hatchet, so that the water will run off the wound. If the cut be made on a side branch, it should be sawed obliquely or slanting, so as to leave no dead wood, or wood to die, and in all cases the cut should be on a sound and healthy part of the tree.

Another error, according to the same writer, consists "in the habit of encouraging luxuriant upright branches to the great injury of the natural horizontal fruit-bearing branches; these are very properly called *glutton* branches, because they consume the sap, which would otherwise go into the lateral and fruit-bearing branches, and in the course of a few years they leave the fruit branches decaying and decayed; the farmer then resorts to his axe, cuts away the dead and dying wood, and leaves the *glutton* in full possession of all the nourishment which the roots afford; but in return this voracious member of the orchard gives no fruit until many years, and then of an inferior quality. "To prevent this the cultivator should suppress all the stiff, upright shoots the first year they appear, by cutting them off close to the branch from which they issue, taking care not to leave the shoulder to the shoot, as he will in such case have the same duty to perform again; but if the shoulder of the *glutton* be cut away, the sap will be distributed among the lateral fruit bearing branches, which will be kept in vigor, and continue in a healthful fruit-bearing state."

Mr. Forsyth, and other writers, give numerous and minute directions relative to restoring old and decayed trees; and where the kind is very valuable, and its fruit uncommonly fine, it may be expedient to be at some pains and expense to prolong the life of a tree which is withering and rotting with age. But we think there is good sense in the following observations by Mr. McMahon, who says, "I am not an advocate for much doctoring old, decayed or sickly trees, but the reverse; therefore recommend as the preferable way to replace such with young healthy trees, so soon as they shew strong symptoms of decay. Whenever you meet with a tree the fruit of which you esteem, propagate it immediately, *whilst in health*, by budding or grafting, &c. and if it should afterwards get into a declined state, replace it with

* Or, to prevent this, the bark and a part of the wood may be first cut on the under side

one of the same or some other kind." It is said, however, and we believe truly, that a young tree will not flourish in the spot where an old one of the same kind had grown.

Suckers should not be suffered to remain from one year to another, near the roots nor on the body of the tree. If the tree appears to have a tendency to put forth a redundancy of wood, the young shoots should be pinched off while tender, but should not be cut while the sap is flowing, because the blossom buds may thus be deprived of sap.

The gum or natural juice of the tree is the best salve for curing wounds made by pruning; and it generally effects the purpose. But when the tree is old, and the wound large, an artificial covering becomes necessary. Mr. Forsyth's composition of lime, cow dung, wood ashes, and sand is too well known to need a particular description. This composition, however, is not so highly valued as it was formerly. "It does not," says an English writer, "appear the best calculated, whether laid on in paste, or with a brush, to resist the sun and rain." "Having had," he adds, "to head down several large trees, and conceiving this composition not calculated for what I thought essential, namely, keeping out the sun, wind and insects, I had part of the trees dressed with this composition and other parts with a composition of pitch, tar, lime, rubbish and sand, boiled to a hard consistence, and laid on hot. In a few months I found Mr. Forsyth's composition partly scaled off, and washed away, and insects harboring under it; but the tar composition was then, as it is to this day, firmly adhering over the whole surface of the wound."

Another kind of composition, recommended by some writers is composed of rosin, bees wax and turpentine; and a third of tar, bees wax and red ochre, boiled or simmered together. The proportions for the last mentioned are a pint of tar, a piece of bees wax about as big as an English walnut, with about half a gill of red ochre, stirred into the mixture while boiling or simmering. But a writer on fruit trees, whose remarks may be seen No. 19, page 145, column 2d, of the New England Farmer, declares that he has found by experience turpentine to be injurious to trees in Carolina, though he supposes in a northern climate it may have no bad effect. This writer recommends "one measure of olive oil, or hog's lard, three do. of melted bees' wax mixed while hot, to be worked after it is cool till sufficiently pliant." Dr. Thacher says, (Orchardist p. 73) "it is probable that a composition consisting of clay, tempered with horse dung, will be found of equal utility," that is as useful as a mixture of bees' wax, rosin and turpentine. The author of the Agricultural Report of Scotland likewise recommends as a plaister for wounds in fruit trees "a mixture of clay and horse-droppings," and says, "this, as it excludes the action of the air and rain is considered to be equally effectual as Mr. Forsyth's composition."

CURRANTS.—This shrub is propagated from cuttings, or short pieces, cut in the spring, from shoots of the *last year*; and in most cases it is best if they have a joint or two of the *former year's wood*, at the bottom of them. The cuttings, says Mr. Cobbett, should have altogether, about six joints or buds; and three of them should be under ground when planted. The cuts

should be performed with a *sharp knife*, so that there may be nothing ragged nor bruised about either wood or bark. It should be trimmed in such a manner that no limbs are allowed to branch out nearer the ground than six inches. Prune the bush every year and keep it *thin of wood*. The Farmer's Assistant says that "an acre, planted with currants, and well cultivated, would probably yield, on an average, a quantity of fruit sufficient to make a thousand gallons of wine yearly. The expense of making the wine does not exceed 50 cents a gallon, and the wine, after having received a little age is worth double that money."

AGRICULTURAL PREMIUMS.

We perceive with much pleasure, that the different Agricultural Societies in New England appear to be laudably and zealously engaged in the great objects of their institutions. We should be happy to copy every agricultural notice, and list of premiums, published in the papers which we receive in exchange; but, in this case, we should make our paper little more than a register of proceedings, which are chiefly interesting to candidates for premiums in particular counties. We wish our articles in general to possess general interest, and to be such as claim the attention of every farmer in every part of the Union. When, therefore, *nothing new* is proposed as an object for a premium, we shall not, generally speaking, copy the notice. We can, however, assure the gentlemen proposing premiums, that our heart is with them, and our pen and types at their service, to be devoted in any mode consistent with our paramount obligations to the *public at large*.

LITERARY CURIOSITY.

The "*Curious old German Book*," described in a preceding column, by our highly esteemed friend and correspondent from Pennsylvania, should seem to be worthy of the attention of the scholar, philosopher and mathematician. That part of it, however, which consists of "obsolete German," we can hardly believe to be the work of Archimedes, who was born at Syracuse, in Sicily, about 267 years before the commencement of the Christian era. At the period when Archimedes lived, we apprehend the German language was not known in Syracuse, and we doubt whether Archimedes ever heard of such a language. In the time of the historian Tacitus, who was born in the year 57 of the Christian era, the Germans, according to that writer, were not acquainted with the use of letters, and of course a very learned and elaborate treatise could not have been written partly in the German language, more than 300 years previous to that period.

We do not pretend even to conjecture how the book in question came into existence. But the following particulars, may, perhaps, assist in tracing the origin of the work. When Constantinople was taken about the middle of the fifteenth century, such writings of Archimedes as existed, together with the commentary of Eutocius, escaped the ravages of the conquerors, and were brought thence into Italy. Here they were found by the famous John Muller, better known by the appellation Regiomontanus, who carried them into Germany, and they were soon afterwards, viz. in 1544, published in folio at Basil, in Greek and Latin, by Hervagius, with a preface by Thomas Gechauf. An edition, in Greek and Latin, in folio, was published by Rivaltus, at Paris, in 1615. Many other editions of the various productions of Archimedes have from time to time been published in Germany, France, and Great Britain, but in the accounts of these editions which we have been able to find, we have not seen the title nor

any notice of the book mentioned by Mr. Preston. large folio, however, with upwards of 300 plates, could not be printed in a corner, and probably it is, at least in part, what it purports to be, "really the work of Archimedes." It is possible that the Greek and Latin may be the work of Archimedes and his commenat and the "obsolete German" may be the production of a German editor. The subject appears to be worth of further investigation.

Remedy for Swollen Legs and Grease in Horses.

A writer in the last American Farmer gives the following as a remedy for horses whose legs have become swollen by violent exercise. Take one pound of nitre and half a pound of sulphur, mixed into a mess with molasses. If the disorder is violent, and the legs greatly swollen, give the animal two balls of this composition twenty-four hours, one at night and another in the morning, for the first two days, and but one every day after till the cure is effected. This writer observes, "I do not assert that this medicine will cure a confirmed grease in horses' heels, but it will cure an incipient disorder. Be sure never to apply any grease or ointment to the horses' heels, nothing but a turpentine poultice. If the grease be obstinate, nothing but mercury will cure him, thus administered: Give the horse two of Calomel over night, and the next morn a commercial purge. This must be repeated three times, stopping one or two days between each dose; after which give him the nitre and sulphur balls. This process will cleanse him thoroughly."

Death of Lieut. Commandant Wm. H. Cocke.—The *Fox*, a vessel commanded by Lieut. Cocke was detached by Com. Porter on the 6th of March in Porto Rico on business connected with the expedition of the *Fox's* approaching the Moro (a castle mounting 500 guns) she was fired at, and her command killed by a 42 pound shot. The Spanish apologized for the act, and declare it to have been an unfortunate accident, and it was observed by Com. Porter in the General Orders, published on the melancholy occasion, that "the Captain General of the Island has given the most unequivocal proofs of the most sincere regret that the event has taken place." Every possible mark of respect was paid to the remains of the deceased.

Correspondence between Commodore Porter and the Governor of Porto Rico.—A number of letters have passed between these personages relating to the circumstances attending the death of Lieut. Cocke. should seem by these that the Governor's apology was not satisfactory. In a letter from Com. Porter dated March 11, and addressed to the Capt. Gen. of Porto Rico, we find the following observations:

"I find your coasts lined with troops since my arrival here. I find reinforcements daily coming in, as am informed by your order to protect the inhabitants from my resentments. I have found every precaution taken to keep me in profound ignorance of the lamentable occurrence; but these things were all in vain. I saw the insult offered to the flag of my country—I have satisfied your military commanders that their force, despicable compared to that at my disposal, and I have convinced the inhabitants that although they are at my mercy, they will not be made answerable for the offences of an individual."

After some further criminations, Com. Porter observes: "I shall leave the island to-morrow morning with a heavy heart, and shall without delay communicate to my government, the melancholy result of my visit here which was intended for the benefit of the civilized world in general."

Russian Claims.—The brig Pearl, Capt. Stevens, of Boston, was lately ordered off the North West Coast by the Russian officer, commanding at Norfolk Sound. After leaving the port, the Pearl was boarded by the Russian frigate Apollo, and documents were presented to Capt. S. declaring the Russian claim to exclusive jurisdiction to extend to latitude 51 N. on the North

east coast of America, northward to Behring's Straits, thence to latitude 27, 50 N. on the Coast of Japan, and that all vessels, of whatever nation, caught within 10 miles, even of those extensive limits, except in case of distress, shall be subject to confiscation, national vessels not excepted.

African Colony.—It is stated in the Baltimore Morning Chronicle, that the American Colonists on the West coast of Africa, are much annoyed by the natives, who, on the 11th of Nov. and 2d of Dec. to the number of 1500, attacked them and killed one man, one woman and one boy, and wounded four others. All intercourse had been cut off with the natives, and the colonists suffered for provisions, and were almost in a state of starvation. Assistance was ultimately sent from the British schooner Prince Regent, and Capt. Laing negotiated a peace, and a prize schooner of 60 tons was presented to the colonists by the commander of a Comorian armed vessel, and it was hoped they would be again interrupted.

Tread Mill.—An English paper gives the following account of the success of this invention: "The Tread Mills in several of the towns of the Southern and Middle Counties are completely out of work—in other words where machinery is attached to them for grinding flour, &c. the overseers are obliged to hire laborers. These terrors to evil doers have frightened away the criminals altogether. In jails where there have been thirty or forty beggars at a time there are now but two or three. The consequence has been a great reduction of prison expense, and a total removal of that nuisance—begging in the streets."

Improved Steam Engine.—A letter has been received in Newburyport from Mr. Jacob Perkins, formerly of that place, in which he states that he had just made trial of his steam engine, and that its success was fully equal to his expectations.

We are informed (says the last number of the London Quarterly Review) on good authority, that in 18 months ending in August last, not fewer than four hundred slave ships had departed from the western coast of Africa, carrying away upwards of 100,000 slaves; nearly one half of these were French, the rest mostly Portuguese.

A merchant in London, Simon Bradstreet, offers, in the London Morning Chronicle, £100 as an immediate contribution to the Spanish cause, and the same sum annually so long as the war lasts, should Great Britain become the ally of Spain.

The Rev. Dr. Gardner, of this city, has been chosen to deliver the next Artillery Election Sermon.

Letters sent by Steam Boats.—By instructions from the Post Master General, all letters and packets of letters, conveyed by steam boats, are to be charged the same rates of postage as letters conveyed over post roads.

The Governor of Louisiana has put his veto on a bill which had passed the Legislature, to prevent Usury. He says, in his objections, that money is a merchantable article, and ought to be used as such.

Honey.—A tree was lately opened near Dennis' Creek, Cape May county, N. J. 5 1-2 feet in circumference, that was found to contain a honey-comb extending 18 feet in length, completely filled with honey; and a paper published at Bridgetown, in the same State, on the 22d Feb. last, says—"A stick of log-cocod was split open a few days since, at the shop of Messrs. Johnston and Sheppard, in this town, in the heart of which was found a honey-comb, fifteen inches long, containing honey of an excellent flavor and in a perfect state of preservation—the comb closely enveloped on all sides with solid timber. How many years have passed since the honey was thus deposited, it is impossible now to discover."

The Mobile Commercial Register states, that within thirteen months the increase of buildings at that place, has been equal to one hundred per cent. in point of value, and that the price of building lots had advanced still more.

A Singular Discovery.—The Detroit Gazette states that a manuscript volume of between three and four hundred pages, was lately discovered by Col. Edwards of that place, under one of his buildings. The book is in a tolerable state of preservation, and is a fine specimen of penmanship. The characters in which it is written are unknown. They are neither Hebrew, Greek nor Saxon, and the only parts of it hitherto intelligible are a few Latin quotations. It is deposited in the Gazette office for the inspection of the curious.

Direct from Com. Porter's Squadron.—The schr. Gleaner, Saunders, 19 days from New Orleans, was boarded on the 10th April, Key West bearing N. distant 6 miles, by a boat from Com. Porter's squadron. The boarding officer informed Capt. Saunders, that the steam brig Sea Gull, the sloop of war Peacock, and the rest of the fleet were lying in Port Allen, Key West; all well. A British sloop of war had captured a piratical vessel, with 60 men, commanded by the notorious Lafitte, who was killed in the action. The pirates hoisted the bloody flag, and cried no quarters—and none were shown, most of them having been killed. Capt. S. has letters from Com. Porter to his friends in the United States.—*New York Ev. Post.*

We understand, says the N. Y. American, from a respectable source in Cuba, that news had been received there from Jamaica, on which great reliance was placed, announcing that the former island was immediately to be taken possession of by the British squadron, under the command of Com. Owen.

Purifying Furnace.—Mr. Ralph Bulkley, of New York, has presented a memorial to the Corporation for erecting small purifying furnaces over sewers and canals, which with small coal fires will destroy the foul air and greatly contribute to the health of the city, and add to the value of property in the neighborhood of these sewers.

Piracies.—The editor of the Philadelphia United States' Gazette has had the patience to keep a journal of the piracies committed since the cessation of hostilities between the American government and Great Britain, in 1812. The catalogue contains 3002!

BELLFOUNDER,

The Wonderful Norfolk Trotter, imported July 1822, from England,

WILL STAND THIS SEASON, 1823,

At Twenty Dollars, and One Dollar the Groom. The money to be paid to the Groom at Covering.

THIS celebrated Horse is a bright bay, with black legs, standing 15 hands high; his superior blood, symmetry and action excel those of every other trotting Stallion. He is allowed by the best judges in Norfolk to be the fastest and best bred Horse ever sent out of that County. He has proved himself a sure foal getter, and his Stock for size and substance are not to be surpassed; they are selling at the highest prices of any Horses in Norfolk.

BELLFOUNDER was got by that well known, fast and high formed Trotter, OLD BELLFOUNDER, out of Velocity, which trotted on the Norwich road, in 1806, *Sixteen miles* in one hour, and though she broke fifteen times into a gallop, and as often turned round, won her match. In 1808 she trotted *Twenty-eight miles* in one hour and forty-seven minutes, and has also done many other great performances against time.

BELLFOUNDER, at five years old, trotted *Two miles* in six minutes, and in the following year was matched for 200 guineas to trot *Nine miles* in thirty minutes, and he won easily by thirty-two seconds. His owner shortly after challenged to perform with him *Seventeen miles and a half* in one hour, but it was not accepted. He has since never been saddled or matched.

OLD BELLFOUNDER was a true descendant from the original blood of the *Fireaways*, which breed of Horses stands unrivalled, either in this or any other Nation.

BELLFOUNDER is strongly recommended to the public by the subscriber, as combining more useful properties than any other Horse in America, and will stand, during the season, at his Stable in Charlestown, where all inquiries, post paid, will be attended to.

SAMUEL JAQUES, Jr.

Charlestown, Mass. April 25, 1823.

ENGLISH BULL.

FOR sale, or to let, an IMPORTED BULL of 3 1-2 years old, of the Normandy breed (similar to the Alderney, only rather larger sized) and considered the richest Milkers in Europe. This animal is large, and very finely shaped, a fine color and perfectly gentle. Price, One Hundred and Fifty Dollars; or if well placed, will be let on equal shares for two years.

Also—TWO BULL CALVES, from first rate Milkers, and a FULL BLOOD ALDERNEY BULL, owned by the Massachusetts Agricultural Society—will be sold for Fifteen Dollars each, if taken away immediately.

Apply to JOHN PRINCE, at his Farm on Jamaica Plain. Roxbury, 19th April, 1823.

FRUIT TREES IN THE NURSERY.

HANDSOME budded Peach Trees, but three years from the seed, yet as large in general as can be reasonably desired, may be had at the KENRICK PLACE in Newton, at 33 cts. each. The Nursery contains upwards of twenty of the best kind of Peaches which have hitherto appeared in the Boston market. Also, 2000 Currant Plants of two years growth, on moderate terms, if applied for soon: they should be planted out at four feet distance in rows four feet apart. Also, large English Walnuts, Butternuts, Catalpa, Mountain Ash, &c. Newton, April 26.

RULES FOR ATTAINING LONG LIFE.

The way to long life is like that to everlasting happiness, arduous and difficult. The person who wishes to obtain length of days must avoid too severe bodily exertion, by which he will either bring on himself infirmities or premature age. I can never see but with pain, how the common people keep young children to laborious employments to which their strength is inadequate. Young colts are spared and not set to severe labor till they have obtained a certain age, when their strength is proportionate to the labor required of them; because their owners know from experience that they are spoiled, and become prematurely old and unserviceable unless this indulgence be allowed them. Is it reasonable that we should spare children less than horses? The other extreme is, however, still worse, and if they are indulged in indolence and high living, it cannot be expected that they will "live out half their days."

All too lively sensations, the too free use of the senses, violent passions, excesses of every kind, by whatever name they may be called; severe exertion of the mental faculties, assiduous study, deep meditation and nocturnal vigils, consume the vital spirits, weaken the powers, and bring on premature old age. Indolence and total inactivity, either of the corporeal or mental energies are nevertheless equally to be avoided. Bacon has well expressed this where he says—"The vital spirits ought not to be left to stagnate till they clog up the vessels, neither ought they to be wasted or so expended as to injure those vessels."

A due alternation of sleep and watching is an essential maxim for those who desire longevity. If you sleep too much you collect a superabundance of juices; for sleep feeds the body more, if any thing, than alimentary substances. It is an indispensable rule for such as wish long life to keep the body as near as possible of equal weight. Now by rest it soon becomes heavier, and by fatigue it is rendered lighter. Both militate against the hope of long life.

As to the natural evacuations they must be constantly kept up, but on no account too strongly excited by the use of frequent or powerful medicines. "No cathartics are necessary," says Boerhave; "for there are people of eighty who have never taken any, and yet have always kept their bodies in a proper state." The same remark applies to all artificial evacuations, to blood letting, perspiration, &c.

DEATH OF FATHER WELCH.

The N. H. Patriot gives the following particulars of the venerable Samuel Welch, who died at Bow, at the advanced age of 113 years.

"Mr. Welch spent the early part of his life on the paternal farm at Kingston; afterwards removed to Pembroke, purchased a small tract of land, and settled upon it. About 50 years since, he removed to Bow, where he steadily cultivated his little farm, till the winter of age was gathering around him, and the infirmities of a second childhood warned him of his approaching dissolution. It was not, however, till a hundred summers had passed, that he was compelled to abstain from labor. Mr. Welch had through life been a man of industry, and a lover of retirement. The dangers of Indian warfare had never disturbed him, though the

savages for many years lurked in the vicinity. No accident of evil appears ever to have befallen him,—his long life has been an even tenor of quiet industry and comfort, unmarked by those vicissitudes which distinguish the history of many of our aged people. The grand secret of his extraordinary health seems to have been his uniform temperance, which, with a single exception, secured to him through life a sound constitution, and entire exemption from disease. Till within a very short time, his mental powers were unimpaired, and he could converse with freedom and propriety. With the years long passed he was most familiar; and would relate with ease, circumstances that occurred half a century ago, while with recent events and the present race of men, he was little acquainted. For the last few years, he has had many visitors; the young and thoughtless, to behold the patriarch of a century and an eighth—the old, to commune with a man, to whom they too appeared as youths. His appearance was truly venerable. Time had made deep inroads upon his frame; his locks had been touched by the silvery wand; his eye, originally dark and brilliant, gave evidence of decaying lustre; while his countenance, wrinkled with years, and his frame, tottering and feeble, could not but deeply impress the beholder. He spoke of life as one weary of its burthens, and wishing "to be away." His death corresponded with his life—it was calm and tranquil. And we trust he has gone to taste the rewards of a life spent in quiet virtue and unambitious goodness.

Mr. Welch was the oldest native of New-Hampshire. Three, however, have died here at a greater age, viz. Mr. Lovewell, of Dunstable, (father to Col. Zaccheus Lovewell, mentioned in Belknap's N. H. vol. ii. p. 233) aged 120; William Perkins, of New Market, who died in 1732, aged 116; and Robert Macklin, of Wakefield, who died in 1739, aged 115. It may be mentioned, in favor of the general salubrity of our climate, that within a century about one hundred persons have lived in New Hampshire to the age of a century and upwards. We doubt whether any other state in the Union can present so many instances of longevity.

Santieu, the French poet, returning home one night to St. Victoire, at 11 o'clock, the porter refused opening the door, saying he had positive orders to admit no one at that hour of the night. After much altercation, Santieu slipped half a louis d'or under the door, and he obtained immediate entrance. As soon as he got in, he pretended to have left a book upon a stone on the outside, on which he rested himself while he waited for the opening of the door. The officious porter animated by the poet's generosity ran to get the book, and Santieu immediately shut the door upon him. Master porter, who was half naked, knocked in his turn, when the poet started the same objection as he had done. Aye, but master Santieu, I let you in, you know, very civilly. So will I you as civilly, said Santieu; you now the price; in or out is the word, and I can dally no longer. The porter, finding he would have to sleep in the street, half naked, and run the risk of losing his place, slipped the piece of gold under the door, saying, I thought a poet's money would not stay long with me, and accordingly purchased his admittance.—*U. S. Gazette.*

PROPOSALS,

FOR PUBLISHING A VOLUME ENTITLED

COMPENDIUM OF AGRICULTURE, or the Farmer's Guide in the most essential parts of Husbandry and Gardening; compiled from the best American and European publications, and the unwritten opinions of experienced cultivators.

Now is the time when agriculture is making rapid strides towards perfection, than appear to have been for ages. This may be attributed in some measure to the Agricultural Societies established in Switzerland, France, Britain and America. But we know of no work accessible by farmers in general, that contains a good concentrated account of these valuable modern improvements. The work proposed, therefore, has occupied the attention of the Editors a considerable time, and still demands the utmost assiduity in collating and condensing for the press—so that no of the recent improvements in rural economy should be omitted that might render it interesting and serviceable to the farmers of this country.

The Editors, (concerned themselves in rural affairs) fully apprized of the importance of agriculture, the first and most indispensable of arts, are determined spare no pains to render it a really useful book to those who know how to appreciate such works.

The volume, to contain about 300 pages, 12 mo. one dollar in boards, will be put to press when the number of subscribers shall be sufficient to encourage printing.

Those persons who have obtained subscribers for the above work, are requested to leave their names at the office of the Manufacturers' and Farmers' Journal, the first of July next. *Providence, April, 1823.*

THE STATISTICAL ACCOUNT OF SCOTLAND.

DRAWN up from the communications of the Ministers of the different parishes, by Sir JOHN SIMON CLAIR, Bart. 21 vols. 8 vo. complete, only one copy will be sold at the very reasonable price of \$50. Among 58 heads of inquiry addressed to each minister (the whole being too numerous for an advertiser as a guide for their reports, are—Name, and its original description of the soil and surface; climate and diseases; instances of longevity; mode of cultivation implements of husbandry; manures; seed time and harvest; quantity and value of each species of crop; total value of the whole produce of the district; wages and price of labor; manufactures; man of kelp; fisheries; roads and bridges; state of the Church, stipends, &c. number of the poor; parochial funds and the management of them; schools, and scholars; number of souls; cattle, nature and value; sheep do.; swine do. coal and fuel; antiquities; character of the people advantages and disadvantages; means by which the situation could be meliorated. "No publication so equal information and curiosity has appeared in Great Britain since Doomsday Book; and that, from the ample and authentic facts which it records it must be resorted to by every future Statesman, Philosopher and Divine, as the best basis that has ever yet appeared for political speculation."

Also—The Complete Grazer, &c. 1 vol. 8 vo.—American Orchardist—Cully on Live Stock—Farmer Assistant—Farmer's Manual—American Gardener—Villa Garden Directory—Cox on Fruit Trees, &c. &c. For sale by R. P. & C. WILLIAMS, Cornhill Square Boston. *April 12.*

NEW GARDEN SEEDS.

FOR sale, by GEO. MURDOCK, No. 14, Market Square, a great variety of English and American GARDEN SEEDS, of the last year's growth; consisting of early Frame, Hotspur and Charlton Pease; early and late Cabbage; early and late Cauliflower; Sweet Marjoram, Thyme, &c. with every other Seed suitable for a Kitchen Garden. Also, 40 lbs. Mangel Wurtzel or Scarcity—100 lbs. Ruta Baga or Swedish Turnip—a quantity of Armack or Carrot. *March 22.—6w*

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but those who pay within *seven days* from the time of subscribing will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the Publisher) until arrearages are paid.

Complete files from the commencement of the paper in August can be furnished.

No. 40.

FACTS AND OBSERVATIONS RELATING TO AGRICULTURE & DOMESTIC ECONOMY.

BY THE EDITOR.

ON MAKING CATTLE VERY FAT.

We believe that farmers and others sometimes "miss the matter" as Hudibras says, by using a great deal of pains, and wasting their produce in making cattle very fat. Some farmers have given up butchers, who pride themselves on selling very fat meat, finding that it does no way in feeding their family, so much it was rejected.* In Great Britain prize cattle were formerly fattened till they were scarcely fit to eat, and the meat had no more value than hog's lard. Sheep were likewise fattened with *oil cake and gin* till the poor things could not rise alone, and needed as much waiting on as a superannuated Duchess. They were frequently stuffed and stimulated till it became necessary to cut their throats to save their lives, it is to say, nothing but a butcher's knife could prevent them from dying of dropsy. A man to procure such food need have the stomach of a Turk, and the digestive powers of an ostrich, to make a meal on ten penny nails.

Meat, however, *reasonably* fat is more profitable, as well as more nourishing than lean meat. But, "to digest this oily matter, there are required, on account of its difficult solubility, a good bile, much saliva, and a vigorous stomach; consequently none excepting those who are in the most vigorous state of health, or who are employed in hard labor can digest it; the bone also gains but little in the fattening process, and the other organs become proportionally less, as the animal becomes more fat, it is best to have cattle well fattened, but not converted into a mass of matter as unpalatable and unwholesome as whale oil. "A coarse and heavy-fleshed ox which would require a very long time, and much good food to fatten, may be slaughtered rather lean. It is, however, so much the extent of fat, as the want of a sufficient quantity of lean flesh of which the consumer complains; for it cannot be doubted, that the lean flesh of a fat animal is superior in quality, and contains more nourishment than any other meat."†

THE PROPER AGE OF CATTLE FOR FATTENING.

"Animals arrived at their full age, at least full size, are well known to be the most proper to take on fat, since nature is not then impeded by a double process. Young animals of great substance, and well formed, will likewise fatten to good profit; but they are generally adapted to the gradual plan of grazing, which is prolonged eighteen months or two years. The grazier thus reaps the profits of their natural growth or increase in stature. There is another species of increase, technically called *growth*; it is the spread or extension of muscular flesh in full aged animals, of large bone and capacious frame.‡

"Tallow is formed from the surplus nourishment given to animals, beyond what is necessary for their more physical development; whence it follows that those which have not obtained their full growth are fattened with difficulty, and only by extraordinary means. Calves, for example, can only be fattened by great quantities of milk, to which must often be added eggs, barley or oat meal, or the flour of beans or peas; and with all this abundance and selection of food, they yield little if any interior fat or tallow. Whereas oxen, at six years of age, with correspondent treatment, give large quantities of that article. Old cattle are also, from loss of teeth, debility of stomach, or other internal disorganization difficult to fat. These facts sufficiently indicate what, on this head, ought to be our practice; to fatten cattle as soon after they have obtained their growth as possible. Oxen generally attain their growth at five or six years, and sheep and hogs at two."*

FOOD FOR FATTENING CATTLE.

It has been often said, and we believe correctly, that it is not profitable, generally speaking, to fatten cattle on any kind of grain. Lawrence, on neat cattle, asserts that "Corn [by which is meant oats, barley, rye, peas, beans, wheat, &c.] cannot be used in the fattening of bullocks and sheep, except in seasons of superabundant plenty." Even Indian corn is often too costly a species of food to be used solely or chiefly for the profitable fattening of cattle, and grass, hay or roots are said to be the materials which true economy requires.† But we have heard it asserted that beef fattened on oil cake, raw potatoes, turnips, &c. will not be so firm, nor of so good a quality, other things being equal, as that which is fattened on Indian corn. If that be true it might be well to commence with turnips and potatoes, and give the animals richer food as they increase in fatness. Frequent changes of diet will prevent the appetite from being palled, and accelerate the process of fattening. An able writer observes that "With respect to feeding, the first rule is, to give little at a time and often; because experience has shewn that animals that eat much in a short time do not fatten so well as those which eat less but more slowly and frequently. The second rule is to begin the course with cabbages and turnips; then to employ carrots and potatoes, and lastly, Indian, oat, or barley meal, the marsh bean, or the grey pea. These aliments ought to be varied five or six times a day, and oftener if convenient; and instead of always reducing them to flour, there is an advantage in sometimes boiling them. A little salt, given daily, is very useful."* It would prove very useful to try experiments on this subject, and publish their results. Let a number of cattle of similar or the same breed, age, propensity to fatten, as ascertained by handling, &c. &c. be fattened at the same time. Let one be fed entirely on potatoes raw, a second on the same root steamed or boiled, a third be made

one half, or two thirds fat on potatoes, and his fattening completed with Indian corn; a fourth be fattened on Indian corn, or corn meal; a fifth be fed with a mixture of all these kinds of food, given together in the same mess, or in different messes. The first feed in the morning for the last mentioned bullock, might be a small quantity of potatoes, or turnips, the second ruta baga, or carrots, or mangel wurtzel, or parsnips, which are highly recommended. Then as the last course of the day's feed give Indian meal, or other food the richest you have. It would be well, likewise, to try the virtues of sweet apples, which would probably prove a valuable food for cattle. The most important objects of such experiments, however, would be to ascertain whether the beef of cattle fattened on potatoes, or other roots raw or steamed is equal in quality to that which is fattened on Indian corn. If not, whether an ox may not be made nearly fat enough for profit on roots, and his fattening completed on corn, and the flesh be as good as if he had been fattened wholly on corn. And if an ox partly fattened on roots, and his fattening completed on corn gives as good beef as one wholly fed on corn, the question arises *how long a time* will it require to give the beef its good qualities arising from the corn? We know as respects swine that farmers will make them partly fat on any thing which they will devour, and then feed them for some time before they are killed with Indian corn or meal to "*harden the flesh*" as they express it. And perhaps the same process will answer as well for beef cattle. Some farmers say that the red or La Plata potatoe given raw to swine, makes as good pork as that which is corn fed. Others say that any kind of potatoe, if steamed or boiled, will make as good pork as can be made of corn. If this be true of pork, why not of beef?

It is a truth which has been confirmed by repeated experiments that food for swine fermented and become a little acid will go farther and fatten them faster than *sweet food* of the same quality. But it is not, we believe, generally known, that *acid food* is most valuable for *neat cattle*, in certain circumstances. Mr. Bordley, however, asserts that "Oxen made half fat, or in good plight, on grass or turnips, are then very highly and soon finished in France, upon a *sour* food thus prepared: *rye meal*, (buck wheat or Indian corn meal may be tried) with water is made into a *paste*, which in a few days *ferments*, and becomes *sour*; this is then *diluted* with water, and *thickened with hay*, cut into chaff, which the oxen sometimes refuse the first day, but when dry they drink and prefer it. All the husbandmen are decidedly of opinion they fatten much better because of the *acidity*. They gave it thrice a day and a large ox thus eats 22 lbs. a day. Maize [Indian] meal, or maize steeped till sour should be tried. This *sour mess* is given during the last three weeks of their fattening, and they eat about 7½ bushels of meal, value four dollars."*

* It should be taken that the process of fermentation is carried too far. The paste should not become mouldy, nor the liquid food in the slightest degree putrid.

* Scotch Husbandry, vol. 1, p. 190.

† Willich on Diet and Regimen.

‡ Code of Agriculture, p. 91.

§ Lawrence on Neat Cattle.

* Treatise on Agriculture, first published in the Albany Argus.

† See a communication for the N. E. Farmer, signed T. published page 234.

We think that there is reason in waiting till animals become "half fat," or in "good plight," before they are fed with acid food. Acids or alcohol create appetite by stimulating the stomach, but if long continued, they weaken the digestive powers, and in time totally destroy the tone of the stomach. The animal will then be visited with what in a human subject would be called dyspepsia, or a want of the power of digestion, fattening him will be out of the question, and he will be worth but little more than the value of his hide. The constitution of an ox may be destroyed by excessive eating, or what may be called high living, and it is only towards the close of his days, near the last stage of his preparation for the butcher that he should be allowed to become an epicure, and indulged with as much as he can eat of rich or high seasoned food. Store keep should be neither too rich nor too abundant; and if an ox is once made fat, and then loses his flesh, he is like one of Pharaoh's lean kine, the more he devours the leaner he becomes. If young cattle are kept in rich pastures in summer, and poor fodder in the winter, sometimes stuffed, at other times starved, they lose their disposition to fatten. To such cattle Mr. Lawrence alludes, when he says, "It is extremely imprudent, indolently to continue at high keep, animals which do not thrive; I advert chiefly to individuals, with which the first loss is always the least." "Stock cattle," says Mr. Bordley, "are kept; others are fattened. The feeding is different. Cattle kept need no kind of grain, nor even hay, unless to cows about calving time. *Straw* with any *juicy* food, such as roots or *drank*,* abundantly suffices for keeping cattle in heart through winter, provided they are sheltered from cold rains. Mr. Bakewell kept his fine cattle on *straw* and *turnips* in winter." "A *drank* for keeping may be made thus: roots, chaff or cut straw and salt, boiled together in a good quantity of water; the roots cut or mashed. The cattle drink the water and eat the rest. Drank for fattening cattle, thus: roots, meal, flax seed, chaff or cut straw and salt, well boiled together in a plenty of water. If given warm, not hot, it is better." The same author says, "Hay, meal, and linseed jelly with drank, must be excellent food in stall-fattening. Linseed jelly is thus made: seven parts of water to one of flax seed steeped in a part of the water 48 hours; then add the remaining water cold, and boil gently two hours, stirring constantly to prevent burning. It is cooled in tubs, and given mixed with any meal, bran or cut chaff. Each bullock (large) has two quarts of jelly a day; equal to a little more than one quart of seed in four days."

* The word drank is given us by Count Rumford for distinguishing this composition from simple water.

FOR THE NEW ENGLAND FARMER.

PAINTING.

I believe it is a general practice for people to do their painting some time during the three summer months; but repeated experiments have been made within a few years, which have proved that a house painted late in autumn or in the winter, will hold the paint more than twice as long as one painted in warm weather.

The reason is obvious; for when paints are applied in cold weather, the oil, with the other ingredients, form a hard cement on the surface of

the clapboards, which cannot easily be erased; whereas, a building painted (as usual) in the heat of summer will soon need a new coat; for the heat causes the oil to penetrate into the wood and leaves the other component parts dry, which will soon easily crumble off.

A SUBSCRIBER.

FOR THE NEW ENGLAND FARMER.

UNBLESSSED EFFECTS OF SLAVERY AND PAUPER MONEY.

Extract of a letter from a distinguished inhabitant of Missouri, well informed, and high in office, to a gentleman in this vicinity, dated Jan. 1823.

"The sapient legislature of our state has, under the name of 'Relief Laws,' virtually enacted that the community shall be trammelled, hand-cuffed, and consequently poor, for ten years to come! and, besides, although it is one of the fairest regions under the sun, yet the curse of slavery is entailed upon it forever; this, in the very nature of things, in our latitude, must keep the people poor; for, first, in a community where there are slaves, whites are always imperious, dissolute and idle; but, second, our climate yields no produce sufficiently profitable to enable the white man to live in idleness himself, and support his slaves to do his work for him. Now, these two things put together, must make us a poverty-struck state forever. Specie has disappeared from among us, and the 'Bills of Credit' of the state, issued in the name of 'Loan Office Certificates,' are passing at a discount of 50 to 60 per cent.

"The produce of the soil is very low—Corn say 20 cts.—Pork, 2 to 2½ cts. and in some parts of this state 1 to 1½ cts.—Beef, 2 to 3 cts.—Wheat, 50 cts. On the other hand, groceries are comparatively very high—Sugar, 25 cts.—Coffee, 50 to 62½ cts.—Salt, (at present) \$3 per bush.—Tea, (Hyson) \$3 to 3½. In the winter of 1819-20, Brown Sugar was sold in St. Louis at 50 cts. per lb. and Salt at \$6 per bushel."

The following, with some other pieces from the pamphlet containing it, was intended for publication more than six weeks since, but was mislaid, and slipped our memory. We hope, however, that no bad consequences will arise from our carelessness, as articles of this kind are not like the current news of the day which derives its principal interest from its novelty.

From the last Pamphlet, published by the Essex Agricultural Society.

MR. BARTLET'S FARM.

The farm in Methuen belonging to William Bartlet, Esq. has been under my direction five years; Mr. Bartlet has all the income from said farm, and pays all the expenses.

Said farm contains about two hundred acres of land, and is divided into twenty lots, all which are fenced with a substantial stone wall; 11 of the lots have been cultivated, and have produced wheat, rye, oats, flax, Indian corn, potatoes, English and Swedish turnips, white beans, timothy, herds-grass and clover hay; 8 lots are at present in grass for mowing; 5 lots for pasturing; one lot is woodland and pasture for young cattle; one lot is an orchard of apple trees, in good bearing; and 5 lots are under culture for corn, oats, potatoes, English and Swedish turnips, and winter rye, with a part of some lots for flax and white beans; besides a garden of veg-

etables for summer and winter use for the family.

The system of rotation of crops is five year. The quantity of manure made upon the farm in a year is about 200 ox cart loads, of four bushels each: this manure is made by the new cattle and swine—about 60 loads by the swine the cattle yard is cleaned up every morning and the manure put into a heap under a cow from the sun and rain. The swine have the shavings of the fields and brooks, the pomace apples, the weeds and other materials thrown to them during the summer and autumn, and are kept in their enclosure all the time, and in the spring the yard is cleared. The neat cattle are kept in the barn-yards all the night in the summer season; and in the barns and yards all the winter season; the water for their drink being brought into the yards by an aqueduct.

About 5 tons of ground Plaster of Paris for each year, have been used for several years past, as a manure upon the grass land, and the corn and grain for sowing have been mixed with it.

The product of the farm some years has been greater than others. It produced in 1821 the following articles:

35 barrels cider, 600 bushels corn, 700 bushels potatoes, 40 bushels English turnips, 4 bushels white beans, 475 lbs. flax, 75 bushels rye, 320 bushels oats, 350 lbs. butter, 2000 lb. cheese, 4000 lbs. pork, 40 cart loads pumpkin 75 tons English hay, 10 cart loads fodder.

And the present year, 1822.

70 tons English hay, 10 tons run hay, 30 bushels oats, 1200 bushels potatoes, 300 bushels Indian corn, 500 lbs. flax, (this by estimation, not being cleaned) 1100 bushels English turnip, 300 bushels ruta baga, 100 barrels cider, 4 bushels winter apples, 20 bushels winter pear 2400 lbs. cheese, 400 lbs. butter, 6 bushels white beans, 12 calves, sold at 7 dollars each, 4 oxen, sold for 294 dollars.

The stock of the farm consists at present: 15 cows, 10 oxen, 3 yearling heifers, 1 spring calf, 1 late calf, 2 calves for butchering, 1 swine, 34 sheep and lambs, and 1 horse.

The labor on the farm is done by myself and wife, with 2 men and 1 boy, and 2 young women or girls: but in the most hurrying time particularly in getting in hay, as many hands are employed to cut and cure it as can work to advantage. And the only drink used by the laborers, both transient and stationary, is produced by the farm, viz. beer and cider.

JONATHAN MORSE, 2d.

Methuen, September 23, 1822.

N. B. This year's produce is added to this statement since the description was made out. Newburyport, November 18, 1822.

NOTE. By the "shavings of the brooks and fields," Mr. Morse means "the grass and weed which grow in the brooks and round the edge of the fields;" which being unfit for fodder are thrown to the swine.

The "ten cart loads of fodder" were the produce of the field of oats; which being seeded with herds-grass and clover, and these, after the oats were harvested, growing luxuriantly the field was mown (the oat stubble and young grasses) and yielded (as Mr. Bartlet has since stated) "ten bulky loads of excellent fodder almost equal to second crop hay."

From the American Farmer.

CATTLE SHOWS.

Every week lately has brought us hand-bills stating forth the premiums to be distributed the coming autumn by the Eastern agricultural societies. From these there appears to be no abatement of their zeal, and great improvement in the application of it. In this paper we have copied the list of premiums offered by the Essex Agricultural Society, signed and probably prepared by the venerable PICKERING—because it departs materially from what seems to have been the leading principle in all the agricultural societies of the country—that of offering premiums chiefly for certain specific articles of husbandry, instead of the combined improvements of entire farms. It will be conceded that we ought not to publish all these lists—for, constitutions, they are very much alike, and contain generally little that is new and important; not so, however, with the one in question—and we have therefore inserted it for the consideration of the Maryland, and other Agricultural Societies. Moreover, the reasons given for drawing attention, and for offering their best rewards, to new objects, serve at the same time to convey practical information which must prove acceptable to most farmers. There is, however, one thing in this scheme of premiums we regret—and that is, that they are offered in—*money* instead of pieces of plate, in some specific form for domestic ornament or use. There seems to us to be all imaginable difference in the sentiment which must accompany the two forms of reward—with the idea of *money*, “filthy lucre,” it is difficult to associate that of generous and patriotic pure rivalry, which conquers without force or aggression, and defeats without inflicting a wound. Money is the common boon of vulgar competition in the lowest grades of human exertion and strife. The common stimulus proffered for the apprehension of the runaway slave, and the house breaker is “twenty dollars reward”—whereas, when the premium is given in the shape of a can or a goblet, a spoon or a plate, it may be placed on the sideboard or mantelpiece, and becomes an object for exhibition and harmless boasting to our friends—and passed down, from one generation to another, as a mark of heirloom in the family—a mark of affection in family bequests—some simple inscription serving to chronicle the merits or the enterprizes for which it was originally bestowed. For ourselves, we confess that we never feel of self-satisfaction than when we are displaying our agricultural friends, the little silver can, standing on cow’s feet—“Presented to S. S. by the Maryland Agricultural Society, importing Shepherdess and White Rose: 1823”—and the silver pitcher, with a engraved likeness of Champion on its side—ten times the cost of them in money would be valueless in comparison. For every premium, however small, some appropriate emblem may be devised, combining permanence of utility—and we take occasion to repeat our offer of our services to have them prepared. Mr. Warner, who has heretofore supplied on the most reasonable terms, appropriate pieces of plate, by order of several societies to whom his work has given entire satisfaction. All we desire is to experience the pleasure of aiding in giving the best direction to the

bounty of those who wisely patronize agricultural emulation. It should be remembered that all Orders for premiums in this shape should be given several months before hand, to give time for their preparation.

The Premiums offered by the Essex Agricultural Society were published in the New England Farmer, No. 37, page 289.

From the American Farmer.

RUTA BAGA.

Worcester, (Mass.) April 1st, 1823.

In reference to the ruta бага, I regret to say, that I am almost alone in this part of the country, in its cultivation. The well established fact, that it communicates an unpleasant flavor to milk, when fed to cows, has brought it into general disesteem. Still I regard it as the most valuable root for husbandry culture. It has been particularly useful to me, in the keeping of swine; and added to my own observation, I have the authority of my farmer for the assurance, that it is equal to one half of their keeping in summer, with the most inconsiderable expense only of labor. My course is to sow the seed thick, and as soon as the plants are of the usual size to set, to begin thinning them out, and giving the green plants, which are pulled, to the swine. The field may thus be gone over several times during the season, leaving the plants at last as thick as they will well ripen by the harvest time. The swine being thus fed at first, became fond of the roots, and will continue to eat them greedily through the winter. Within a few days I have witnessed a large basket of them from the cellar thrown into the pen, and apparently as readily devoured, as would have been so much corn. The hogs are in good condition, and these turnips have been their principal food. My sheep also are much improved by them, especially about the time of yearning. These facts are the rather stated, as proof that the seed which you kindly sent, will be appreciated by at least one individual, and with the thanks of the society for your attention. I pray you to accept mine for the value of the present.

With much respect,

I am your obedient servant,

LEVI LINCOLN,

Cor. Sec’y W. Ag. Society.”

PERFUMES A PREVENTIVE AGAINST MOULDINESS.

Dr. MacCullah, of Edinburgh, has published a paper in the Philosophical Transactions of that city, in which he points out, that all essential oils possess the property of preventing the growth of mould.

Ink, paste, leather and seeds, are among the common articles which suffer from this cause, and to which the remedy is easily applicable. With respect to articles of food, such as bread, cold meats, or dried fish, it is less easy to apply a remedy, on account of the taste. Cloves, however, and other spices, whose flavors are grateful, may sometimes be used for this end.

The effect of cloves in preventing the mouldiness in ink, is indeed generally known; and it is obtained in the same way by oil of lavender, in a very minute quantity, or by any other of the perfumed oils.

Leather may be preserved in the same manner. The same essential oils answer the purpose. The cheapest, of course, should be se-

lected; and it would be necessary to try oil of turpentine, for this reason.

It is a remarkable confirmation of this circumstance, that Russian leather, which is perfumed with the tar of the birch-tree, is not subject to mouldiness, as must be well known to all who possess books thus bound. They even prevent it from taking place in those books bound in calf, near to which they happen to lie. Collectors of books will not be sorry to learn, that a few drops of any perfumed oil will insure their libraries from this pest.

With regard to *paste*, Dr. M. prefers resin to alum as a preservative; but lavender, or any other strong perfume, such as peppermint, anise, bergamot, are perfectly effectual for years, however the paste is composed. That which the Dr. himself employs in labelling, &c. is made of flour in the usual way, but rather thick, with a proportion of brown sugar, and a small quantity of corrosive sublimate. The use of the sugar is to keep it flexible, so as to prevent its scaling off from smooth surfaces; and that of the corrosive sublimate, independently of preserving it from insects, is an effectual check against its fermentation. This salt, however, does not prevent the formation of mouldiness. But as a drop or two of the essential oils above mentioned is a complete security against this, all the causes of destruction are effectually guarded against. Paste made in this manner, and exposed to the air, dries without change to a state resembling horn; so that it may at any time be wetted again, and applied to use. When kept in a close covered pot, it may be preserved in a state of use at all times.”

He proceeds.—“This principle seems also applicable to the preservation of seeds, particularly in cases where they are sent from different countries by sea, when it is well known that they often perish from this cause. Dampness, of course, will perform its office at any rate, if moisture is not excluded; yet it is certain, that the growth of the vegetables which constitute mould, accelerate the evil; whether by retaining moisture, or by what means, is not very apparent. This, in fact, happens equally in the case of dry rot in wood, and indeed in all others where this cause operates. It is a curious illustration of the truth of this view of a remedy, that the aromatic seeds of all kinds are not subject to mould, and that their vicinity prevents it in others with which they are packed. They also produce the same effect daily, even in animal matters, without its being suspected. Not to repeat any thing on the subject of cookery, I need only remark, that it is common to put pepper into collections of insects or buds, without its having been remarked, that it had the same power of keeping off mould, as of discouraging or killing the *ptine omnivorus*, or other insects that commit ravages in these cases.

In concluding these hints, I might add, in illustration of them, that gingerbread and bread containing caraway seeds, is far less liable to mouldiness, than plain bread. It will be a matter worthy of consideration, how far flour might be preserved by some project of this kind.”

To cure Chilblains before they are broken.—Wash them in water as hot as you can bear, and dry them with a cloth; rub them with spirits of turpentine before the fire and keep them warm.

From the Boston Daily Advertiser.

THE SEASON.

We have experienced, this Spring, something of the Canadian and Siberian seasons. It is well known, that in those countries, vegetation seems to indemnify itself for its retardation in Spring, by extraordinary and rapid efforts—and the harvest of grain is as early in those countries as in more Southern latitudes. The last year (1822) we sowed peas, and planted early potatoes on the sixth of March—which we remarked to have been more early, by 15 days, than we had ever been able to perform the same operations for 17 years preceding. This year we had nearly two feet of snow on the ground on the first of April, and we were not able to commit our early seeds to the ground till the 8th of April, a difference of 30 days. Yet on the 20th of this month, we find the natural progress of plants (not affected by cultivation) one day more forward than they were last year, and nearly a week more forward than during an average of seasons for the last 17 years.

In the year 1815 Apricots opened their flowers on May 1st.

In 1816 on the 29th of April.

In 1822 few Apricot blossoms were opened on the 21st of April.

In 1823 an equal number of Apricot blossoms were fully expanded on the 20th of April.

The Hyacinth gave a correspondent result, and fruit trees generally correspond in forwardness to the plants just mentioned. Generally speaking the season is as forward as it ever was on the most favorable years, so far as it depends on the progress of nature. The labors of man have however been suspended, in a very unusual degree, and much more exertion will be required in the same space of time, to perform the ordinary spring duties of the Farmer and the Gardener. The ground is in a fine state for cultivation. The tender grasses have been admirably protected against those heaving frosts which throw the roots out of the ground, and thus disappoint the hopes of the husbandman. The warm weather has not been accompanied with searching rays, or drying winds, and the season, so far as it has yet advanced, promises an ample indemnity for the unpropitious prolongation of winter, and the decay of agricultural exertion. We may derive from this experience, a lesson of patience, and a sentiment of confidence in the wisdom and protecting Providence of the Great Ruler of the Seasons.

From the American Farmer.

BURNING SOD.

That agriculture in Maryland, has not proved profitable generally, is demonstrated by the desertion of many from our lands, and by the poverty of cultivators, although taxation is very light, and the owners possess slaves, and although almost every farm is near a navigable stream. What reason can be assigned for this, but that our land being worn out, will no longer yield as formerly. Corn and tobacco, have been our principal crops, and these require four ploughings, to bring them to maturity. Our rains fall very heavily, and the oftener the ground is turned over, the more the fine particles of mould are of course washed away—few farmers keep up their cattle, and of course little manure is made.

For many years, we have been leaving out old fields, cutting down our woods, and cultivating virgin soils, but these being now exhausted, families have been compelled to emigrate.

Mr. Beatson's pamphlet on clay or sod burning, has come most appropos, and promises to restore our lands cheaply, and expeditiously—I commenced his practice last year, and all my neighbors remarked, what benefit my corn received, by only putting one or two handfuls of burnt sod in every corn hill, before I put in the corn. I take up my pen now to inform you, of one experiment which has afforded me great encouragement, and which has determined me to devote the labor of two hands, exclusively, to clay or sod burning. On a very poor spot, I perceived the corn only about two feet high, whilst the adjoining corn was five feet; having been told, that manure, when placed between the corn rows, would improve the crop, as the roots would shoot into it when the corn began to tassel, I run a furrow between each row, and put in, and covered over the burnt sod—the result was, that this poor corn, became as good as all the rest. In the fall I ploughed in my wheat, and now the wheat where I put in the burnt sod, is so verdant and luxuriant, that you may distinguish it from the rest of the field, half a mile off—my neighbors have been surprised at the great difference, and calculate that it will yield twice or thrice as much as the adjoining wheat, although the soil last year was evidently richer.

The average of corn crops last year, on unmanured, and commonly cultivated fields, did not amount I fear to more than ten or twelve bushels to the acre, the cost of four ploughings and planting, cannot I think be estimated at less than seven dollars; if the price of corn be three dollars and a half per barrel, the cultivator is nearly repaid for his labor, and nothing remains for wear of animals, and of implements, and for contingencies.

I calculate that two hands can make 140 bushels of burnt sod in two days, which are the most that can be advantageously put upon an acre—say that these 140 bushels, only coule crops of corn, wheat, clover, &c. for only six years, and then consider the profit. To make it clear, I will put down the expense and profit in an account.

ESTATE	Dr.	ESTATE	Cr.
To two hands for two days,	4	1st year, two barrels more corn,	7
Scattering the burnt sod, and hauling stumps and sticks,	3	2d year, ten bushels more wheat,	10
Days	7	3d year clover	10
		Add the three following years,	30
			Dollars 57

Let every one buy Mr. Beatson's book, and he will see, that my calculation is very moderate, and that it might be doubled on the credit side.

When I consider how many stumps and sticks are left to rot in the woods, and to be washed into our rivers by rain, which might be converted into ashes, and to useful sod burning, I sigh at the loss of riches by ignorance—of this mode of making manure.

Three or four free negroes, who have used it on tobacco, and in their gardens by my advice, tell me that it has astonished them—my neighbor an excellent English farmer, has long

practised it with success, and in gardening, had last year several stalks of corn, in his garden, with six or seven ears. Think how restoring worn out soils, we can support our cattle, &c.—and thus make stable manure, and then estimate the profit to land holders throughout Maryland.

When I cut down my wheat, I will give you a statement of the produce from the land manured with burnt sod in the rows, and from the adjoining not so manured. I hope that emigration will henceforth cease, till we are so populous, and that our lands will rise in value and that prosperity will be exhibited by comforts and cheerfulness, instead of long faces, complaints and sickness, which are now produced by bad harvests. Your's respectfully,

THOMAS LAW

P. S. I have not a fixed kiln, but carry stumps and sticks to the place where I plough up the clay, to cover the stumps and sticks with it, and after setting fire to the sticks, I continue throwing on clods wherever the smoke comes out. The clods ought to be dry.

Extract from Bordley's Husbandry.

In many parts of America are idle improvident people, masters of farms, who spend their time in taverns or other places of vast amusement: any where rather than at home. These haunts are at the expense of their domestic and true happiness. Sooner or later they bring on them debts, wants and grating claims of creditors. Such a people can never be brought to soil cattle, or at all to improve their families. Where is solid comfort to be found if not at home? The meanness, the selfishness and folly of these husbands, fathers or masters, conspicuous, degrading and shameful; who, regardless of wife, child and dependents claim their protection, their affections and their affections, and even regardless of the true interest of their precious selves, fly from their own pininess in the moment when they mount their horses and hurry to the tavern, the race, the pins, billiards, excess upon excess of toddy, the most nonsensical and idle chat, accompanied with exclamations and roarings, brutal foreign to common sense and manners as mind of wisdom can conceive of depraved men. Had these men, so deficient in character, been trained but a few years among the orderly thoughtful good farmers of some neighborhood, they would have learnt valuable lessons for conducting their farms, themselves their domestic affairs, greatly to their comfort and advantage, and to the comfort due to their families and dependents, to whom they more than they are accustomed to feel for them. There are on the other hand, those with industry aim at providing for their families but it is not with an honest mind and fair reputation. The strength of these is in cunning: If indeed they wish to be perfect that detestable of all qualities, they need not far from home; unless for the sake of embellishing the satanical talent with some variety. They might then associate with the infamous class of people distinguished for more this base quality than of provident industry, fairness, and honest manly candor.

Boasting.—A man who boasts of his honesty, woman of her chastity, are both to be suspected.

NEW ENGLAND FARMER.

SATURDAY, MAY 3, 1893.

The Farmer's and Gardener's Remembrancer.

MAY.

PASTURES.—Be so good as not to turn your cattle into your pastures till they can get what is called a "good bite." If you let them in too early they will tread your land into hutch potch, or salmagundi, destroy the sward, and "do more mischief than a little." Dr. Deane said that the 20th of May is early enough for our climate, and we believe it is quite as well, where the farmer can afford it, to keep his working oxen and horses to hay or other stall feed at least till the first of June. It is not right to turn all sorts of cattle into pastures promiscuously. "Milch kine, working oxen, and fatting beasts, should have the first feeding of an enclosure. Afterwards sheep and horses. When the first lot is thus fed off, it should be shut up, and the dung that has been dropped should be beat to pieces and well scattered. Afterwards the second pasture should be treated in the same manner, and the rest in course, feeding the wettest pasture after the driest, that the soil may be less potched.

"Something considerable is saved by letting all sorts of grazing animals take their turns in a pasture. By means of this nearly all the herbage produced will be eaten; much of which would otherwise be lost. Horses will eat the leavings of horned cattle; and sheep will eat some things that both the one and the other leave.

"Let the stock of a farmer be greater or less, he should have at least four enclosures of pasture land. One enclosure may be fed two weeks, and then shut up to grow. Each one will recruit well in six weeks; and each will have this time to recruit. But in the latter part of October, the cattle may range through all the lots, unless some one may become too wet and soft. Feeding pastures in rotation, is of greater advantage than some are apt to imagine. One acre managed according to the above directions will turn to better account, some say, who have practised it, than three acres in the common way."*

IRRIGATING OR WATERING LANDS.—Those of our readers who have conveniences for irrigating their lands may as well attend to this business as soon as possible. If you have a spring or brook on a high part of your farm you may take all or a part of its waters from their natural channels, and lead them over the driest part of your soil, keeping them as nearly on a level as possible without having them stagnate and form quagmires in their course. You must have your water completely at command, for water like fire, although a good servant is a bad master. It is no matter how soon you prepare your channel, trenches, &c. and let a little water into them by way of experiment, but you should not apply it in any considerable quantity till the ground becomes somewhat dry. After the grass has got a fair start let the quantity of water be diminished, and you will of course stop it from your fields in wet weather, and let it run in its natural channel. After the grass is pretty well grown, water must be used only in dry weather, but in very clear and hot days it should not be applied. Nights and cloudy days are the prop-

er times for irrigation. But we shall not give minute and circumstantial directions, for you must make use of your own good sense in this as well as most of other processes for improving your land. A temporary stream will not pay you for confining and directing its waters, unless, as is sometimes the case, it contains a good quantity of mud or sediment, which you may induce it to deposit for the purpose of manuring your soil. But muddy water turned on grass, which is growing, is apt to make it gritty and unwholesome.

"In regard to waters much impregnated with iron they were formerly supposed totally unfit for the purposes of irrigation; but it is now fully proved by the accurate experiments of an able chymist, and by the extraordinary growth of grasses in Prisleigh meadow, in Bedfordshire, that ferruginous waters (waters impregnated with iron) are friendly to vegetation, when properly applied.

"Waters that are impregnated with the juices that flow from peat-mosses, are considered by many not worth applying to the soil. It is objected to them that they are commonly loaded with such antiseptic substances (matters which prevent putrefaction) as will retard, instead of promote vegetation, and that they convey no material nutriment. But others are of opinion that a want of sufficient slope in the meadow, or of proper management with regard to the water, has occasioned the disappointments which have been experienced when bog-waters have been applied."* We have no doubt but a top dressing of lime after irrigation, would correct any evils to be apprehended from the acid or antiseptic qualities of the water used in that process.

SECURE YOUR FRUIT AND FOREST TREES AGAINST CATTLE.—We have our eye on some farmers and others, who have planted trees, on the borders of high ways and other places, who have not more than half secured them against cattle. This is not much wiser than it would be to build a house on a high snow bank in March or April. The trees should be substantially fenced, as high as the largest cattle can reach. But it will be advisable not to exclude too much of the sun and air. Four stout stakes, well driven into the ground at a suitable distance from the tree, and narrow but strong slips of board, nailed from one to the other, so as to form a square enclosure, with the tree for its centre, will answer, provided the fence is carried high enough.

ENGRAFTING FRUIT TREES.—Dr. Thacher says (American Orchardist, p. 35) "The most proper season for grafting in our climate, is from about the 20th of March to the 20th of May." Mr. Cobbett states that "the way in which grafting and budding is done, cannot, upon any principle consistent with common sense, become matter of written description. Each is a mechanical operation, embracing numerous movements of the arms, hands, and fingers, and is no more to be taught by written directions than to make a chest of drawers is. To read a full and minute account of the acts of budding and grafting would require ten times the space of time that it requires to go to a neighbor and learn from a sight of the operation, that which, after all, no written directions would ever teach."†

Notwithstanding, however, this energetic de-

nunciation against undertaking to describe the process of grafting in writing, we shall here repeat some rules given by Mr. Preston, of Stockport, Pa. It is true, we have published them once [No. 16, page 121,] but as we have subscribers who have commenced taking the paper since they were published, we will give them once more, viz:

"1st. Be careful not to loosen the bark of the stock in splitting it; and the safest way to guard against that is to split the bark with a sharp pointed knife, before the splitting of the stock.

"2d. As after the leaves are grown it is not expected to use scions from a distance, but to cut them out of the orchard as wanted, be sure in selecting the grafts to cut them in such a manner as to always take the bulge, between the year's growth, to shave and sit in the stock, as in that joint or bulge, between the year's growth, the wood is curled, open and porous, to receive the sap readily from the stock, and such scions will grow and flourish—when if taken from any other part of the twig they would not grow.

"3d. The clay should be very fine and tough, and pressed and bound water tight round the stock below the split to retain all the sap that oozes out to support the graft."

It is not good management to graft young trees, until you know what kind of fruit they will produce without grafting, otherwise you may introduce by art less valuable fruit than nature would have given you. Neither is it proper to take off too many limbs for the purpose of grafting in one season, lest you ruin the tree by stopping the circulation of its sap. You may see farther directions on this subject in No. 19, p. 145, of the N. E. Farmer.

LOOK TO YOUR PEACH TREES.—These trees are annoyed, and sometimes killed by small grubs, said to be about an inch in length, which are found in the roots. They are said to be produced by a blue fly, which attacks the trees from about the middle of August to the middle of September, and generally deposits its eggs in the bark at or near the surface of the ground. To take out this worm the roots must be uncovered, as soon as the tree begins to bud in the spring, and the spot looked for where the gum oozes out. Follow the cavity round with the point of a knife or a chisel, until you come to the solid wood, lay the whole open, and you will find the worm, with a white body and black head, which must be destroyed and the hole filled with cow dung, rendered adhesive by lime, sand and ashes.*

A writer in the New York Evening Post, in prescribing against this disorder says, "As soon as the buds begin to put forth, and the leaf to appear in the spring, and before they are quite out, remove from the bottom of the tree entirely all the dirt or turf till you come to the bare roots, from which scrape all the loose and old rotten bark; then take three quarts of fresh slacked lime for a large and full grown tree, and so in proportion for a smaller and younger one, and lay it carefully on, and about the roots, covering it from the weather, and it will destroy these destructive insects entirely. It is about the time the present season to begin your work, but some years it will be earlier, and some later." Wood ashes put round the roots in au-

* Deane's N. E. Farmer, p. 314, 315.

* Code of Agriculture.

† American Gardener, par. 281.

* Deane's N. E. Farmer, Art. Peach Tree; Wells & Lilly's Edition.

tuna, it is said will preserve peach trees from these insects, as well as increase their fruitfulness. Indeed wood ashes, lime, soap suds, and spent tanner's bark have all been recommended as preventives against insects. We wish they might all be more thoroughly and extensively tried, both separately and mixed, and the effects of their application made public.

QUERE WITH REGARD TO PLANTING TREES.—A friend of the editor suggests an apprehension that we are (or rather Mr. Cobbett is) wrong in certain directions for planting trees, published in our paper of the 19th April, p. 301. It is there advised, previous to planting a tree, to "cut off all the fibres close to the roots; for they never live, and they mould and do great injury. If cut off their place is supplied by other fibres more quickly." This, says the querist, is contrary to the opinions and practice of such people of his acquaintance as have the most practical knowledge of the subject, and he wishes to know on what authority we founded our directions. We, therefore, now produce the observations of some other writers which happen to be at hand.

Mr. Bucknal, an English author, (quoted in Thacher's Orchardist, p. 31,) says, "*the small matted fibres must be cut off, as they are apt to mould and decay, and prevent new ones from shooting.*" Dr. Deane says, (N. E. Farmer, p. 459, Wells & Lilly's edition,) "*All the small fibres are to be cut off, as near to the place whence they are produced as may be, excepting perhaps when they are to be replanted immediately after they are taken up. But it will require great care to plant them in such a manner as not to distort or entangle the fibrous roots, which if done, will be worse for the plant than if they were cut off.*"

We have consulted Messrs. Mawes, McMahon, Bradley, Darwin, and some other writers, but have found no particular directions on this subject. Mr. Marshall, an old English writer, appears to be in favor of preserving the fibres. But we will give his directions at length, which we presume will not appear tedious to any one properly impressed with the importance of performing this operation in the most advantageous manner.

"Describe a circle about five or six feet diameter for the hole. If the ground be in grass, remove the sward in shallow spits, placing the sods on one side of the hole; the best of the loose mould placed by itself on another side, and the dead earth, from the bottom of the hole, in another heap. The depth of the holes should be regulated by the nature of the subsoil. Where this is cold and retentive, the holes should not be made much deeper than the cultivated soil. To go lower, is to form a receptacle for the water, which, by standing among the roots, is very injurious to the plants. On the contrary, in a dry light soil, the holes should be made considerable deeper; as well to obtain a degree of coolness and moisture, as to be able to establish the plants firmly in the soil. In soils of a middle quality, the hole should be of such depth, that when the sods are thrown to the bottom of it, the plant will stand at the same depth in the orchard as it did in the nursery. Each hole, therefore, should be of a depth adapted to the particular root planted in it. The holes ought, however, for various reasons, to be made previous to the day of plant-

ing. If the season of planting be spring, and the ground and the weather be dry, the holes should be watered the evening before the day of planting, by throwing two or three pails full of water into each; a new but eligible practice. In planting, the sods should be thrown to the bottom of the hole, chopt with the spade, and covered with some of the finest of the mould. If the hole be so deep, that with this advantage the bottom will not be raised high enough for the plant, some of the worst of the mould should be returned before the sod be thrown down. The bottom of the hole being raised to a proper height and adjusted, the lowest tier of roots is to be spread out upon it; drawing them out horizontally, and spreading them in different directions, drawing out with the hand the rootlets and fibres which severally belong to them, spreading them out as a feather, pressing them evenly into the soil, and covering them, by hand, with some of the finest of the mould; the other tiers of roots are then to be spread out and bedded in the same manner. Great care is to be taken to work the mould well in, by hand, that no hollowness be left; to prevent which, the mould is to be trodden hard with the foot. The remainder of the mould should be raised into a hillock, round the stem, for the tripple use of affording coolness, moisture, and stability to the plant. A little dish should be made on the top of a hillock, and from the rim of this the slope should be gentle to the circumference of the hole, where the broken ground should sink some few inches below the level of the orchard. All this detail may be deemed unnecessary; by those, I mean, who have been accustomed to bury the roots of plants in the grave-digger's manner; but I can recommend every part of it to those who wish to insure success, from my own practice. Plants which have been transplanted in the manner here recommended, whose heads have been judiciously lessened, seldom require any other stay than their own roots. If, however, the stems be tall, and the roots few and short, they should be supported in the usual manner, with stakes, or rather, in the following manner, which is at once simple, strong, and most agreeable to the eye. Take a large post, and slit it with a saw, and place the parts flat-way with the faces to the plant, one on each side of it, and two feet apart, and nail your rails upon the edges of the posts."

FOREIGN.

GREAT BRITAIN.—Accounts have been received from London to the 23d of March, but furnish no news of importance. The editors of English newspapers appear to exert their oratorical faculties in opposition to any interference of the British government in the impending contest. They are willing that individual Englishmen should enter the lists merely as private citizens, but not under the banners of the nation. The Morning Chronicle is of opinion that a departure from neutrality, on the part of Great Britain, would "rouse the national vanity of the French, and give rise, perhaps, to an interminable war. This is a consequence which it would be madness to hazard. Spain is strong in situation, and does not want men. We can serve her more effectually by remaining at peace than by sending a force to the Peninsula. Repeal the foreign Enlistment Bill—allow free scope to British generosity; and the French government, or we are much mistaken, will soon repeat its undertaking."

SPAIN.—Accounts have been received from Gibraltar as late as the 27th of March. A report had been previously in circulation that 15,000 French troops had entered Spain, but this was premature, and no hostilities

had commenced at that period. The king of Spain is considered by the Cortes as a mere cipher, and of course makes no figure in such a crisis. He has been ordered to Seville, and the Cortes, Ministers, &c. are to accompany him. They were to set out on the 20th of March, and were expected to reach the capital of Andalusia about the 10th of April. Five Spanish armies are formed and forming; the whole, it is said, amount to 100,000 men, well clothed and furnished with means for the anticipated contest. The French declare their intention of proceeding no farther than Madrid, but to wait the tide of events at that capital. There is every appearance, however, of their meeting with some serious impediments on their march to that place; and if we might be allowed to prophecy (according to the immemorial usages of editors) we should say that the French will lose many lives and gain but few laurels in this expedition. If the Gallic eagle does not get his bones picked by Spanish crows, he will be the luckiest fowl that ever was fledged. Men who stay at home to defend their altars and fire sides possess great advantages over those who penetrate a foreign country to dragoon its inhabitants into despotism.

Spanish Cortes.—This body, in a reply to the king's speech, make the following observation: "The unheard of pretension of dictating laws to independent nations, will, if not resisted, draw in its train the ruin and dissolution of every state in Europe; and an interminable and exterminating war would reduce this fertile region to the barbarous state of the people of Asia."

GREEKS & TURKS.—On the evening of Christmas, Omer Pacha, the Turkish commander, with several thousand men, made an attack on Missolonghi with the hope of surprising it. The Greeks, however, were on their guard, beat off their enemies, and the next day surprised and took the Turkish camp, together with twelve pieces of cannon, all the munitions of war, &c. and killed 500 or 600 men. Still the Greeks have a "hard row to hoe." The Turks are collecting fresh armies, and threaten to overrun the Peninsula.

DOMESTIC.

Mr. Adams' Donation to the Town of Quincy.—The Daily Advertiser gives a sketch of a pamphlet containing the deeds of gift from the Hon. JOHN ADAMS, of several pieces of land, and of his library to the town of Quincy, with a catalogue of the library. By this it appears that the instruments convey two lots of land, called the Cedar Pasture, to the said town, conditioned that the rent be placed at interest in some solid fund either of the Commonwealth or of the United States, and the interest again placed at interest, for building a Temple for the public worship of God for the use of the Congregational Society in that town, and the support of a school for the teaching of the Greek and Latin languages, &c. Likewise a second deed conveys six lots of land on the same conditions, and to erect a stone school house "over the cellar which was under the house anciently built by the Rev. Mr. John Hancock, the father of John Hancock, that great, generous, disinterested, bountiful benefactor of his country, once President of Congress, and afterwards Governor of this State, to whose great exertions and unlimited sacrifices this nation is so deeply indebted for her independence and present prosperity, who was born in this house; and which house was afterwards purchased and inhabited by the reverend, learned, ingenious and eloquent Lemuel Bryant, pastor of this congregation; which house was afterwards purchased by an honorable friend of my younger years, Col. Josiah Quincy, and was also inhabited by his son, Josiah Quincy, jun. a friend of my riper years, a brother barrister at law, with whom I have engaged in many arduous contests at the bar, who was as ardent a patriot as any of his age, and next to James Otis, the greatest orator."

The third instrument is a conveyance, on certain conditions, to the town of Quincy, in consideration of the motives and reasons enumerated in the two former deeds, of his library, which is thus described; viz: "The fragments of my library, which still remain in my possession, excepting a few that I shall reserve for my consolation, in the few days that remain for me." To this document is annexed a catalogue of the library, containing nearly three thousand volumes. These several donations, with the restrictions and limitations, have been accepted by the town of Quincy, with votes of thanks to the venerable donor.

CITY GOVERNMENT.

The new city government was organized at Faneuil Hall on Thursday. The services commenced at 10 o'clock. Prayers were read by Rev. Dr. Freeman—the oaths of office were administered by the late Mayor, his successor in office, and the Aldermen and members of the Common Council. The Mayor elect then delivered an Address adapted to the occasion.

Pirates captured.—There is a report, by the way of Baltimore, that Com. Porter's squadron had taken and destroyed the greater part of the pirates off Havana.

Accounts from Nassau state that the launches from the Tyne and Thracian, Br. sloops of war, had attacked a large piratical vessel, in the port of Malta, a short distance from Barracoa, and succeeded in capturing the crew—killed from 15 to 20—prisoners 28.

The last advices from Mexico, inform that the short-reigned Ex-Emperor Iturbide I, had renounced his Imperial Diadem, and submitted to all the terms dictated to him by the Congress.

To Ship Builders.—The National Intelligencer of the 19th April, contains an advertisement from the Treasury Department of the U. States, setting forth proposals for building three vessels, to be used as floating lights. The first is to be three hundred tons, the second and third one hundred tons each.

Mr. C. W. Goldsborough, of Philadelphia, has issued proposals for publishing the *United States Naval Chronicle* in one volume, annually. It is to embrace a general and biographical history of the navy, official reports, and a variety of matter suitable to such a work.

The number of patients at the Asylum for the Insane, at Bloomingdale, N. Y. on the 1st of January last, was 91—48 men and 43 women. It is stated that a large proportion of those deprived of their reason, in this institution, have "lost it in consequence of the indulgence of spirituous liquors."

Russian Clergy.—Mrs. Henderson, in a letter published in the *Missionary Herald*, says that at the time when a Bible Society was formed in Novogorod, (Russia) there were many of the clergy who had never seen a bible, and on hearing of it, asked *what kind of book it was?*

Long Island Pippins.—Mr. Henry Mitchell, of Flushing, Queens county, N. Y. gathered last fall from one acre, eight barrels of apples, six barrels of which were sent to Liverpool by one of the line of packets as an adventure. The captain was requested to return him the proceeds, in British sovereigns, thirty of which, amounting to \$133.33, were lately paid over to Mr. Mitchell, exclusive of freight and commissions! Such is the celebrity of Long Island Pippins throughout the world, and so important is the cultivation of good fruit.

N. Y. Statesman.

Cold Winter at New Orleans.—The past winter has been very severe at New Orleans, for that climate. From the 10th to the 16th of March the ponds in the suburbs of that city, were sufficiently frozen to permit skating. The Mercury was at 14 Fahrenheit. The orange trees are all killed, including those of fifty years standing.

Canada.—Mr. Haime lately stated in the British House of Commons that Canada cost England half a million of pounds sterling annually, and that the strength of England would be increased by granting independence to this and many other of her foreign colonies.

Horse System.—There is now in Virginia, a gentleman by the name of Smith, lately from New Orleans, who can teach the wildest horse (having a knowledge of the bridle) in less than an hour to follow him through a large company without taking hold of the bridle, up a pair of stairs three or four feet or more high, into a dwelling house, and walk from one room to another as invited, without any alarm. This gentleman system has a wonderful effect in breaking any horse to draw in harness. His price for imparting this system or secret is \$20. The system is so very simple that he can teach it to any person in one hour.

Richmond Enquirer.

A grass bonnet, in imitation of Leghorn, was sold at Baltimore, a few days since, at \$10 dollars. It was made by some young lady, living on the Susquehanna.

Long Island Races.—Great preparations are making, says the U. S. Gazette, for the races which will take place in May next at the Union Course. Eight horses from the South have already arrived, and are now in training, upon Long Island—ten more are soon expected.

An association has been formed in New Jersey, to check, by "precept and example," the immoderate use of ardent spirits. It is a "growing and blasting evil," and we wish such associations were more numerous.

Melancholy Accident.—Three men were killed on the 13th of March by the explosion of a cask of powder containing 320 lbs. They were a part of the expedition designed for the Rocky Mountains.

The new establishment at Key West has been named *Allen's Town*, in honor of the lamented Lieut. Com. William H. Allen.

The effects of Intoxication.—A man named J. Schaeffer, was lately drowned in attempting to cross the Cadorus, about 4 miles below York, Pa. He undertook to cross a stream of water while in an intoxicated state, but fell out of the canoe and was drowned. He was soon taken up, while retaining some appearance of life, but all attempts to resuscitate him were fruitless.

Letter Lost.—A letter mailed in Charleston, S. C. on the 5th of February, directed to G. & R. Waite, N. York, and containing one thousand dollars in bills of the United States' Branch Bank, has been lost, and 100 dollars reward offered for its recovery.

New College in Kentucky.—At Augusta, Ken. a College has recently been established, which, under divine Providence, bids fair to rank among the first institutions of the kind in the Western country, if not in the United States.

AGRICULTURAL ESTABLISHMENT,

NO. 20, MERCHANTS' ROW,

At the East End of the Old Market.

FOR sale as above, a variety of the most approved single and double mould board Ploughs, C. Howard's improved cast iron mould board, with wrought Shear and Coulters, Cast iron do. do. do. J. Seaver & Co's. do. do. Bigelow's wrought do. do. Warren's much approved common Ploughs, Sinclair's side hill do. do. do. Howard's much improved Cultivator, an implement highly esteemed for its use and utility in drill cultivation, Beatson's Scarifier, Bennet's Broad Cast, Seed Sowing Machines, calculated for large and small seed, Eastman's improved Straw Cutter, Safford's new invented Straw Cutter, much improved, Common hand Straw Cutters, An English Vegetable Cutter, Stevens' patent steel spring Hay and Manure Forks, Steel spring Potatoe Hoers, English cast steel broad Hoers, Common and steel do. do.

A great variety of Garden and other Agricultural Implements.

Tree Brushes, for destroying Caterpillars, an article highly recommended for that purpose, by the Hon. Timothy Pickens, whose communication on this subject appeared in the *New England Farmer*, April 26, page 308.

AGRICULTURAL & HORTICULTURAL SEEDS.

JOSEPH BRIDGE, No. 25, Court Street, has just received, per London Packet, a variety of

GARDEN AND FIELD SEEDS,

which added to his former extensive assortment, makes the most complete variety, probably in the U. States. Among them—300 lbs. Carrots, 200 lbs. Beets, 50 lbs. Mangel Wurtzel, 200 lbs. Ruta Baga, 30 bush. Peas, 100 Raddish, of sorts; Lettuce, Cabbage, Cauliflower, Kale, Brocoli, Sweet Marjoram, Thyme, Summer and Winter Savory, Sage, Hyssop, Fennell, Dill, Falsific, Scorzenera, Endive, Red and White Clover, Red Top, Foul Meadow—with an extensive collection of Flower Seeds, Bird Seeds, &c.

GARDEN TOOLS, viz: Pruning and Budding Knives, Pruning Saws, Transplanting Trowels, Garden Reels and Lines, Edging Irons, &c. Flower Pots constantly on hand.

May 3.

May 3.

☞ The following flower of Parnassus is as fragrant as the fruit it celebrates.

To the Hon. the Speaker B****w, who presented nine incomparable Peaches, to be divided between three Sisters.

"How beautiful! how rich! how very fine!
Sisters see this! see that! O, how divine!
If Eve with fruit like this did Adam treat,
Sure none can blame the man "that he did eat."
Such, "Mr. Speaker," were the gracious speeches
Made by the Sisters over your nine peaches.
I merely said "Men by their fruit are known,
And this is in the Speaker clearly shown."
The sisters then could each their peaches three,
Without reserving even one for me.
On that I moved, what did not seem unfair,
To take from each a peach, and leave a pair.
But calling me "to order" one and all,
I was oblig'd my motion to recal.
Yet still they "order" cried with all their might,
Until the "Precious Question" brought them right.
"Thanks to the Speaker," then was the decree,
And this most pleasant task impos'd on me;
No sooner "Mr. Speaker" said than done,
A "vote of thanks" was passed to you "Nim. Con."
And next year should your peaches prove as fine,
Again "show cause" and I'll invoke the nine.
Lynna Mineral Spring Hotel. I. T. S.

The Weather.—It is a luxury to live in so delightful a season as we have enjoyed for a week past. In so bland an atmosphere—under so bright a sky—the affections must bloom and expand like the flowers. Good as you may be, taking the average of the year, you ought to be better and more amiable now than at any other period.

"Chief, lovely Spring, in thee and thy soft scenes
The smiling God is seen."

Spring is the darling offspring of Deity. And it repays his kindness by the fragrant worship of new-born flowers, and the sweet anthems of the birds of music. It is the season of innocence—when maiden roses look for the first time on the earth which they adorn. It is the season of love—when zephyrs allure him to enchanting beauty. It is the season of happiness—when we transplant to our own bosom the sweets that surround us, and, discarding every annoying sentiment, make the mind as gay within as the garden is without.

"Earth in her rich attire
Consummate, lovely smiled." [Ch. Courier.

In Holland, that beehive of industry, every available source of service is made use of, so that dogs, and even goats, are not suffered to pick the bone or eat the bread of idleness.—Most of the little wares and merchandizes, vegetables, turf, and particularly fish, are drawn by the former, who are properly harnessed for the occasion to little carts, and according as the carts vary in size and are laden, the dogs are put to in proportion, so that sometimes there are six dogs harnessed to a cart, three abreast, whilst the goats are yoked to infantine wagons and carriages, to air and exercise little children. It is really astonishing to see the weight these animals will draw; nothing can exceed their docility; and for their labor, the Hollander (who is remarkable for his humanity to the dumb creation) feeds them well, and lodges them in his own house very comfortably.—Owing to the great care paid to their dogs, the canine madness seldom appears among them. On Sundays they are permitted to refresh and enjoy themselves, and never show any disposition to escape from their lot.

I do not know a practice which I should more recommend than early rising, whether devotion, health, beauty, or improvement of the mind, were the objects in view. How cheerful and how animated are the meditations of the morning! What a delightful bloom flushes into the cheeks from its balmy exhalations! What an unspeakable cheerfulness glides into the soul, from hearing the devotional matins of the lark, and from beholding the new-born scenery of nature! How necessary is such a regimen to preserve that sweetness of complexion and of breath which are the very essence and perfume of beauty! When people think of accounting to God for the talents they have received, they overlook the hours which are lost in morning sloth and unreasonable indulgence. I have injured myself for many years to this habit of early rising. In the spring months of April and May particularly, I grudge every moment that is wasted after five. I consider it as a rude neglect to all those sweets which opened to salute me, and always find so much more deducted from the firmness of my health, and the vigor of my understanding.—Bennet's Letters.

Every body has heard of Irish Bulls, but it is seldom we have a genuine blunder of this sort, on as good authority as the following: In 1808, the present Capt. Woolsey, the late Capt. Gamble, and Mr. James Cooper, of this city, then all of the Navy, with the late Col. Chrystie, and Col. Gardner, now of this city, of the Army, formed one mess, at Oswego, on Lake Ontario. The servant of Colonel (then Ensign) Gardner, was an Irish lad of about twenty, who was known in the mess by the name of *Sligo*. On one occasion, when the gentlemen were drinking their tea, the fire fell down, and a coal lodged in a large crack, where it soon produced a blaze. "Put out the fire, *Sligo*," said one of the gentlemen. The lad seized the tea-kettle, in haste, but when he had it over the fire, he suspended his operations, though every feature in his face expressed doubt, anxiety and zeal. "Put out the fire," cried the head of the mess, in a voice of thunder. The poor boy wished to obey, but his brain was on fire itself. He thought he saw instantaneous destruction in the act. The dry, shingle edifice was in flames before his mind's eye, and forgetful of his customary obedience, he ventured to expostulate: he cried in a tone of awful remonstrance—"The water's war-r-m Sir!"—N. Y. Com. Adz.

Anecdote of Dr. Mitchell.—It is said the celebrated Dr. Samuel L. Mitchell, travelling in the stage, and happening to be the only passenger, was very sociable with the driver, asking him many questions, some of which the driver considered rather philosophical, and not a little puzzling. The "knight of the whip," in turn, put the following question to the learned Doctor:—"Why, Sir, do white sheep eat more than black sheep?"

"Indeed," said the Doctor, "I was not aware that they did." The Doctor was proceeding in a very philosophical manner to account for the difference, by supposing the white sheep had less oil in their fleeces, than the black sheep.—"You are not right, Sir," said Jehu. "Pray, my friend," said the Doctor, after a few moment's reflection, "can you tell?" "I can Sir; there are more of them."

ENGLISH BULL.

FOR sale or to let, an IMPORTED BULL of 3 1/2 years old, of the Normandy breed (similar to the Alderney, only rather larger sized) and considered the richest Milkers in Europe. This animal is large, and very finely shaped, a brindle color and perfectly gentle Price, One Hundred and Fifty Dollars; or if well placed, will be let on equal shares for two years.

Also—TWO BULL CALVES, from first rate Milk ers, and a FULL BLOOD ALDERNEY BULL, owned by the Massachusetts Agricultural Society—will be sold for Fifteen Dollars each, if taken away immediately.

Apply to JOHN PRINCE, at his Farm on Jamaica Plain. Roxbury, 19th April, 1823.

BELLFOUNDER,

The Wonderful Norfolk Trotter, imported July 1822, from England,

WILL STAND THIS SEASON, 1823,

At Twenty Dollars, and One Dollar the Groom. The money to be paid to the Groom at Covering.

THIS celebrated Horse is a bright bay, with black legs, standing 15 hands high; his superior blood symmetry and action excel those of every other trotting Stallion. He is allowed by the best judges in Norfolk to be the fastest and best bred Horse ever sent out of that County. He has proved himself a sure foal getter and his Stock for size and substance are not to be surpassed; they are selling at the highest prices of any Horses in Norfolk.

BELLFOUNDER was got by that well known, fast and high formed Trotter, OLD BELLFOUNDER, out of Velocity, which trotted on the Norwich road, in 1806 Sixteen miles in one hour, and though she broke fifteen times into a gallop, and as often turned round, won the match. In 1803 she trotted Twenty-eight miles in one hour and forty-seven minutes, and has also done many other great performances against time.

BELLFOUNDER, at five years old, trotted Twenty miles in six minutes, and in the following year was matched for 200 guineas to trot Nine miles in thirty minutes, and he won easily by thirty-two seconds. He owned shortly after challenged to perform with him Seventeen miles and a half in one hour, but it was not accepted. He has since never been saddled or matched.

OLD BELLFOUNDER was a true descendant from the original blood of the *Fircarays*, which breed of Horses stands unrivalled, either in this or any other Nation.

BELLFOUNDER is strongly recommended to the public by the subscriber, as combining more useful properties than any other Horse in America, and will stand, during the season, at his Stable in Charlestown where all inquiries, post paid, will be attended to.

SAMUEL JAQUES, JR.

Charlestown, Mass. April 25, 1823.

FRUIT TREES IN THE NURSERY.

HANDSOME budded Peach Trees, but three years from the seed, yet as large in general as can be reasonably desired, may be had at the KERRICK PLACE in Newton, at 33 cts. each. The Nursery contains upwards of twenty of the best kind of Peaches which have hitherto appeared in the Boston market. Also, 200 Currant Plants of two years growth, on moderate terms: if applied for soon: they should be planted out at four feet distance in rows four feet apart. Also, large English Walnuts, Butternuts, Catalpa, Mountain Ash, &c. Newton, April 26.

NEW GARDEN SEEDS.

FOR sale, by GEO. MURDOCK, No. 14, Market Square, a great variety of English and American GARDEN SEEDS, of the last year's growth; consisting of early Frame, Hotspur and Charlton Pease; early and late Cabbage; early and late Cauliflower; Sweet Marjoram, Thyme, &c. with every other Seed suitable for a Kitchen Garden. Also, 40 lbs. Mangel Wurzel or Scarcity—100 lbs. Ruta Baga or Swedish Turnip—a quantity of Armac or Carrot. March 29.—6w

TERMS OF THE FARMER.

☞ Published every Saturday, at THREE DOLLAR per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing will be entitled to a deduction of FIFTY CENTS.

☞ No paper will be discontinued (unless at the discretion of the Publisher) until arrearages are paid.

NEW ENGLAND FARMER.

No. 41.

SAVING AND MAKING THE MOST OF MANURE.—BY THE EDITOR.

(Continued from page 292.)

ON COMPOSTS.

It was well observed by an English writer, "the common way of spreading unmixed dung over land, be it arable, pasture or mowing, by no means answer the end; for the fertilizing particles of dung being of a volatile nature, are readily exhausted by the action of the sun and air. Most people think if they have enough, all is well, and vegetation cannot be of going on. This is especially the case in repairing of worn out grounds. But with us we can by no means agree. *Dung ought to be considered no more than a good ingredient to be mixed with earth and other sorts of compost.*" Indeed we have heard it asserted by an experienced agriculturist that he actually nearly destroyed his grass in a mowing lot by spreading the soil in the spring a quantity of fresh dung taken from his pig-stye. "The dung," he said, "was of too hot a nature, and caused the turf to be so scorched by the sun that the grass was burnt up." It is true that fresh animal dung, applied to plough-land, does not often produce so bad an effect. But the manure in this case, by mixing with the soil, forms a sort of compost, and the dung is diluted with earth. We hear farmers complain, in dry seasons, that their dung does more harm than good, by increasing the effects of the drought. But if it is well mixed before it was applied to the soil with two or three times its bulk of earth, it could preserve against the drought instead of increasing it. A plant will no better grow on a dung-heap than on a sand-heap, and in some cases pure sand would be a better application to increase the fertility of a soil than unmixed dung. We have seen many directions for making composts, but have no recollection of any thing more perspicuous, and at the same time more comprehensive, than the following from Sir John Sinclair's Code of Agriculture.

The utility of composts has been proved by the experience of numbers, in various districts. The subject may be considered under the following heads: 1. The materials used; 2d. The crops to which it should be applied; 3d. The effects produced.

1. *Materials.*—Unslacked lime, and earth of different sorts, are the substances used. Quick lime is the proper stimulus for bringing the powers of a compost into action; operating upon a heap of earth in some degree as yeast does upon a quantity of flour or meal. Enough lime should be applied to excite a species of fermentation in the heap, and to neutralize any noxious mineral substances which may exist in it.

The formation and conveyance of compost has long attended with much expense, where circumstances will admit of it, horses, instead of manual labor, ought to be employed in the process of preparation, and the compost should be prepared in the field to which it is afterwards to be applied.

"It has been ascertained by a number of experiments, that two bushels of unslacked lime are sufficient for each cubic yard of a medium quality, and as 80 cubic yards of earth are sufficient to manure an acre, 160 bushels of unslacked lime is the quantity required.* To obtain this quantity of earth it is the practice of some farmers to plough the head ridges of both ends of the field, ten inches deep, and to collect one half of this, which can often be spared without any loss, as the head ridges are generally too high, in consequence of the earth accumulated in the course of years, from the plough being cleared every time it turns. It has been calculated that where a hedge ridge is eighteen feet broad, 72 feet of it in length, ploughed ten inches deep, will produce 40 cubic yards of earth, and consequently the two head ridges will produce 80 cubic yards of compost for the field to be manured.

"Composts are frequently made of various materials, as several sorts of earth, lime, old mortar and plaster, green vegetables before they run to seed, tanner's bark, sawdust, soap ashes, dung, &c. It is recommended that instead of being laid in regular layers, they should be mixed as much as possible in forming the heap. A fermentation is soon excited, and the oftener the heap is turned so much the more will fermentation be promoted.†

2. "Composts are peculiarly well calculated for grass-lands, and ought to supersede the offensive and wasteful practice of laying putrescent matter on the surface of the soil, by which a very large proportion of its most valuable component parts is lost in the atmosphere.—They are likewise of great use to moorish lands, augmenting their staple, and adding to them a number of valuable and enriching substances. In regard to sandy or clayey soils, composts, principally consisting of articles different from their general nature respectively, will improve their texture and convert them into loams.

3. "The effects of composts are highly satisfactory. In regard to grass-lands experience has shown that they at once improve their quality, and check, for years, the progress of moss, or even unprofitable grasses. In thin moorish

*Composts, however, may be made with less lime, or without any lime, as will appear hereafter. And when quick lime and dung are used, a layer of earth should be interposed between those two substances, for lime, if mixed with dung, in the first stage of its putrefaction corrodes and dissipates its effluvia, and your manure may thus be consumed with but little more advantage than if it were burnt with fire. It appears that lime is a useful material, if used with hog-yard and slaughter-yard manure. See the statement of Col. Valentim's mode of cultivating Indian corn, No. 22, page 176.

†It is doubted, however, whether there is much advantage to be derived from often stirring a compost heap. Every time it is turned over, a quantity of gas, which composes the essence of the manure, will escape. Mr. Bordley says, "often turning the compost may weaken it as a manure, and even check its fermentation." And Sir John Sinclair, himself, says (Code of Agriculture, pp. 196, 197.) "The old practice of frequently stirring, turning and mixing the dung, without in general even covering the heap with earth when it was turned, is now very properly laid aside."

soils, composts, properly and repeatedly applied, alter the nature of the soil; it becomes more fertile, retains its moisture better, and does not suffer by the summer's drought, which would otherwise burn up the crops.

"It is a circumstance not to be omitted, that lime will operate in compost, upon lands that have been exhausted by the over frequent or too abundant application of lime or manure, even where it had not succeeded when used by itself. This is a strong recommendation of such mixed manure, as land may thus be cultivated to advantage, that would otherwise remain unproductive."

A good compost may be made simply by a mixture of surface mould and barn yard dung, without any particular rules for the quantity of each. Sometimes two parts of dung are used for one of earth; sometimes they are mixed in equal quantities, and it is not uncommon to compound two parts of earth with one of dung.—The use of the earth is to imbibe the gas or effluvia arising from the dung, while it is decaying and putrescent. "The only error, into which the farmer can run, is to supply such an inconsiderable quantity of earth as will be incapable of imbibing the elastic and volatile particles, and thus by his own mismanagement occasions a waste of vegetable aliment. One cart load of soil to two of stable dung is the least proportion which he should ever attempt to combine, and perhaps if the two were mixed equally, he would be compensated for the additional labor and expense.

"The whole art of composting, is to arrange the materials in alternate layers,—to shake up the litter and dung with a hay fork that it may lie loosely,—to cover the top and the sides with earth, and to give it a sloping direction that it may cast off excessive moisture. Its height should never exceed four feet, or four and an half; and its breadth should be such that a man on either side may be enabled to fling the ingredients into the centre without trampling on the heap; for compression in all cases retards the putrefactive process. If the mass, after being compounded, is long in generating heat, urine, salt water, or even fresh water poured on the top slowly, that it may ooze downward, will bring it on with rapidity. On the other hand, should the process advance with too great violence, which can always be known by keeping a stick in the middle, and drawing it out occasionally for trial, the fermentation must be restrained by turning over the dung-hill, and mixing anew the ingredients. This will not only put a stop to the mischief, but facilitate a second fermentation; and as fresh particles of earth will be brought into contact with the decomposing matter, the whole will be enriched and impregnated with the fertilizing principles. These general views are applicable to every species of compost.

"Simple earth, although excellent for bottoming and strewing over the pit dug near the barn, is of all materials the most unprofitable in compost dung-hills. When free from all foreign mixture, it contains nothing on which the fermenting process can operate, it brings no

addition to the mass of fertilizing matter. It is the recipient of the elementary principles, but contributes none of them itself; and as far, therefore, as its agency is concerned, it is unproductive and unprofitable. A matted sward thickly entangled with roots, or mud dragged from the bottom of ditches, and replete with aquatic plants, are clearly preferable on this account, that, besides bringing earth to the composition, they supply a large proportion of vegetable matter. Whenever the soil must be carted to the heap, it is better to lay out the expense in transporting these enriching materials, because they will not only equally absorb and retain the evaporating gases, but greatly augment the quantum of manure.*

Mr. Arthur Young says, in substance, that the common way to make composts is to lay the several materials in layers one over the other, till a large heap is raised; and it is advised by some authors, and the practice of many farmers is to make these layers from six inches to a foot in thickness; but this he has found by experience to be wrong; for the fermentation raised in the compost is not strong enough to penetrate such thick layers, especially those of clay, or strong earth; for after the rest have sufficiently fermented, and the compost is turned, these layers rise almost as whole as when first laid, and must be broken by hand to mix them with the rest of the compost; whence arise two inconveniences, one an extraordinary expense, and the other twice or thrice turning is sometimes necessary to dissolve these large pieces; and as a new fermentation is excited every time the compost is turned, the strength of the manure is greatly wasted before it is laid upon the land, where it is then incapable of raising any considerable fermentation, which is, he thinks, one of the principal uses of manure.

From the American Farmer.

FLAX DRESSING MACHINE.

To WM. M. BARTON, ESQ.

Dear Sir,—I beg your acceptance of a sample of flax for the inspection of the "Valley Society of Virginia." The bleached sample is from flax that was water-rotted, the dew-rotting being found not to answer for that process. Of the dew-rotted parcel, I must remark, that the quality of the flax is not considered to be the first—all of this year's crop being very inferior, and all of that which is dew-rotted, at any time, whatever the quality may have been previously, sustaining so much injury from the process as not to entitle it to first rate, however well cleaned it may be. I cannot, therefore, present this as very fine in quality, but beg your attention to the dressing of it. This was done by a machine of small dimensions, simple construction, and exceeding durability, invented by Mr. Rodman Goodsell, of Oneida county, New York. With this machine, driven by one horse, a man will break, hatchel, and dress, clean enough for the distaff, 100 lbs. per day—and with the same thresh 100 bushels of grain per day, the latter without one cent extra expense. As your county is celebrated for its wheat culture, Mr. Goodsell and myself have determined to send one of them to you in the course of a month. Should it arrive in time for your March meeting, please to do us the favor to call the atten-

tion of the gentlemen of the society to its performance, and drop me a line of the impression it produces. The price of each machine is \$100—that is, we furnish the machine and give the right to use it for that price, the purchaser paying, of course, the expenses attending the erection of the same, together with such incidental charges as may attend its transportation from the place where it may be manufactured.

I am, with great respect,

Your obed't humble serv't,

SAMUEL SWARTWOUT.

New York, 6th Feb. 1823.

The Flax Machine may be driven either by water or horse power.

One horse is sufficient to turn one or more of these cylinders. The cylinder for dressing or threshing requires to be driven at the rate of about 160 or 170 revolutions in a minute. Any millwright will make the calculations for the size of the large wheel, when intended for water power. For horse power, our large horizontal wheel attached to the horse shaft, is 12 feet diameter—around this we put a strap, 5 or 6 inches broad, of harness leather—this strap runs round the shaft or axis of the second large wheel, upon a whirl 18 inches diameter. There is a wheel for a strap or band upon one end of this axis 6 feet diameter, over which another strap of the same breadth and thickness, as that which runs over the large wheel, descending into the room below, and is attached to and runs over a small whirl fixed upon the axis of the cylinder. This latter whirl is 8 inches diameter. The above calculations are made upon the supposition that the horse walks three times round his path in a minute—the diameter of his walk being 21 feet.

From the National Gazette.

Messrs. Editors,—A paragraph in your Gazette of Saturday, on the subject of Bees, induces me to mention, that an easier method of gathering the honey than in India, and a more merciful one than what is generally pursued in this country, is practised in Germany. There, this interesting little insect is cultivated to great extent, frequently as an amusement, and very commonly as a source of revenue. Many treatises have been written on their singular nature, domestic arrangements and the best mode of rearing them. Perhaps I put some of your readers in mind of the renowned Baron Münchhausen, when I state that in some parts of Germany they are regularly taken to pasture! yet such is the fact. I have seen on the great heath of Lüneburg in the Hanoverian dominions, hundreds of Hives that were carried there from distant places in the spring of the year, for the bees to pasture on the heath flowers; herdsmen attended them; and in the autumn they are taken home again.

The mode of securing the honey is this, early in the fall the Bee-father (as the person who cultivates Bees is called) protects himself with gloves and a kind of cap long enough to hang over his neck and shoulders, and which has a wire mask—and in dark rainy weather, or early in the morning or late in the evening, when all the Bees are at home, he turns the hive upside down—a match made of dry herbs, such as rue wrapped in tow and linen, which burns without flame and makes a great smoke, is lighted and the smoke blown upon the hive, which

drives the bees to the lower part of the hive and gives him an opportunity of taking what quantity of honey he thinks they can spare, leaving a sufficiency for winter provision. Should it happen that the Bee-father takes a large tribute, or that an early winter prevents the Bees from replenishing their stock as expected—they then are regularly fed with composition consisting of sugar, honey, wine and water, boiled together, which is put in a sifter under the hive.

Your's,

A GERMAN.

Curious method employed in France of protecting Trees from injury by the Spring Frosts.

It is stated in the Memoirs of the Royal Society of Agriculture at Paris, that, from repeated experiments, frost, like the electric flu, may be drawn off from the atmosphere, and have its influence diverted so as to guard a particular object from its most pernicious effect. An application of this principle is therein directed to preserve from injury the tender blossoms of fruit trees which are so often cut by spring frosts. Intertwine a thick hemp rope [probably straw or flax would do as well] among the branches of a fruit tree in blossom and let the end of it be suspended so as to terminate in a pail of water at the bottom of the tree; should a slight frost take place during the night, the tree will not be in the least degree affected, while the surface of the water which the rope is, will be covered with a coating of more or less thickness, though water placed in another pail by the side of it will frequently, where the frost is slight, have a thin ice on it.

BREWING.

Niceties in Malting, the observance of which increase the profits of the Malster near per cent.

In malting barley, the water should be changed oftenest in spring and autumn, when the weather is warm: if barley is left to steep long at these seasons in the same water, the water will grow slimy, and sometimes so that the malster should therefore watch the change of the water, and when he finds it smooth and oily to the touch, or inclining to smell or taste sour, it must be changed immediately.

The common method of changing it, is first to draw off that in which the barley was steeping, and then by pumping or pails full, fill the cistern again: but this is a bad way, for when the water is drawn off the barley lies close and is apt to heat, which causes great damage. It is therefore recommended to get a hogshead of water in readiness near the cistern, which should be thrown on the barley the instant the first water is drawn off; and as a hogshead of water is sufficient to wet eight bushels of barley, as many hogsheads, save one, should be afterwards added, as the cistern will wet.

River water is the best, and hard spring water is the worst: in general the water the soonest lathers should be preferred.

A thin-skinned fine-coated barley is the best for making malt; it need not be very full-died, but should be quite ripe.

Barley that has grown on land highly manured is not so good as that produced on a land moderately rich without manure; and if it

is very luxuriant, either by nature or art, barley will not be fit for the malster.

It is a good practice to give malt as much drying as possible on the floor; it does not sink so much as on the kiln, and acquires no feign taste; when it comes to the kiln, the fire in the furnace should be moderate but equal. Brown malt, used in the same proportion as pale, will not make the strongest beer; but the pale malts that are slack dried, make a raw unwholesome liquor that will not keep.

Malsters should never buy barley grown on various soils, or even different fields, because the kernels will spire at different times; they should therefore never buy the barley. A malster having bought one hundred quarters of the barley, without knowing it, soon discovered it in the malting, and sold it to a hog-dealer for eight-pence a quarter less than he gave, as the least loss he should incur by his gain.

To discover whether malt has been made of rye or unripe barley, throw a couple of handfuls of it into a bowl of water; stir it gently, and the grains that have not been malted will sink, the half-malted grains will have one end sink, and so swim in a perpendicular position, and those that are perfectly malted will swim. The best barley will not malt equally well at all times. As soon as housed, before it is in sweat, and after the sweating is over, it will malt well, but not while it is in sweat.

Barley that has been got in early in a very early season malts but indifferently; but if the late barley is left abroad till rain falls on it to loosen the husks from the kernel, it will malt well, and yield a large increase.

Method of extracting the virtue of Hops in Brewing.
The usual method is to put in hops without preparation into the strong beer or ale wort; the consequence is, the richer and better the wort is, the less it will partake of the essence of the hops. The rich fat wort sheathes up the pores of the hop, and, as it were, embalms the leaves, so that the beer or ale wort can extract scarcely any part of the necessary quality of the hop; but when it is put into the smaller wort, a fluid of a more thin nature, there the pores are unsheathed, and the small beer is rendered too bitter; therefore the hops, before they are put into the strong drink, should be previously soaked in a pail of hot water.

To confirm the truth of this observation, take a quarter of an ounce of the best green hops, and instead of pouring on it simple boiling water, let the water have the same quantity of sugar boiled in it that would be necessary to sweeten so much tea when made, and you will find that the sweetness of the water will prevent its extracting the grateful bitter of the tea.

Cheap and easy Method of Brewing.

One bushel of malt, and three quarters of a hundred of hops will, on an average, brew twenty-gallons of good beer.

For this quantity of malt, boil twenty-four gallons of water; and having dashed it in the upper with cold water to stop the boiling, keep the malt (properly covered up) for three hours; then tie up the hops in a hair cloth, and boil malt, hops, and wort, all together, for three quarters of an hour, which will reduce it to about twenty gallons. Strain it off, and set it to work when luke-warm.

In large brewings this process perhaps would not answer, but in small ones, where the waste is not so great, and where the malt can be boiled, the essence is sure to be extracted.

Best method of making Sage Cheese.

Take the tops of young red sage, and having pressed the juice from them by beating in a mortar, do the same with the leaves of spinach and then mix the two juices together. After putting the rennet to the milk, pour in some of this juice, regulating the quantity by the degree of color and taste it is intended to give to the cheese. As the curd appears break it gently, and in an equal manner; then, emptying it into the cheese-vat, let it be a little pressed, in order to make it eat mellow. Having stood for about seven hours, salt and turn it daily for four or five weeks, when it will be fit to eat. The spinach, besides improving the flavor and correcting the bitterness of the sage, will give it a much finer color than can be obtained from sage alone.

Easy method of restoring and rendering legible, damaged Parchment Deeds, &c.

The following mixture, it is asserted, will make writing which has been obliterated, faded, or sunk, either on paper or parchment, immediately legible. Bruise two or three nut-galls, infuse them in half a pint of white wine, and let the bottle stand for two days in the sun or any other equally warm situation; then wash that part of the parchment or paper which is wanted to have the writing recovered, by means of a sponge or soft brush dipped in the vinous infusion; and the purpose will be immediately answered, if it be sufficiently strong. Should that not happen, its powers must be increased by an additional quantity of galls; and, perhaps, in some instances, stronger heat, and even stronger wine, may also be necessary.

MEDICAL INTELLIGENCER.

The first No. of a weekly paper, called the "Boston Medical Intelligencer," was published on the 30th ult. by Mr. R. M. Peck. It is edited by J. V. C. Smith, M. D. Lecturer on Anatomy at the Berkshire Medical Institution. It is stated in the Publisher's advertisement that "It is the object of this paper to give opportunity of communicating, without delay, histories of recent cases, developing the character of prevailing diseases; to furnish seasonable information on subjects which regard public health; and to present the reader with a variety of miscellaneous matter on subjects relating to medicine, that many times is withheld from the public in general in consequence of the scarcity of the works from which they are obtained."

The following extract from the paper which is the subject of this notice, shows the evil consequences of burying the dead in the midst of populous cities; a custom which we are sorry to see retained with so much pertinacity by certain rulers and elders thereof. This method of poisoning the living, in order to shew our affection for the dead, is carrying our veneration for the tombs of our ancestors to an extreme which nothing but superstition can sanction.

SEPULTURE.

At Saulieu, Burgundy, a mild catarrhal fever was epidemic. A very corpulent body was buried in the Church of St. Saturnin. Twenty-three days after, a pit was opened by the side

of that, in which was the corpulent body, to bury a woman who died in child-bed, under this fever. A most fetid odour immediately filled the church, and affected all who entered. In putting the woman's coffin into the pit, some sanies issued—its odour strongly affected the assistants. Of one hundred and seventy people who entered the church, from the opening of the pit till the burial, one hundred and forty-nine were attacked with a putrid malignant fever, somewhat resembling the epidemic. Its nature and intensity left no doubt it owed its malignity to the infection of the church.

A malignant epidemic fever, caused by removal of the earth of the cemetery of St. Peter's Church, also shows the danger of burials in churches and populous places. At *Luzerne*, an old cemetery was dug over to embellish the town: soon after, an epidemic appeared which carried off a great many people, particularly the poor, and in the neighborhood of the cemetery. Six years after a like cause produced an epidemic in *Amberg*, in *Auvergne*.

The body of a very fat person was buried under a foot of earth and eight inches of stone: the abundant vapours from it made it necessary to dig it up. Three diggers undertook it—two of them were attacked with violent vomiting, and left the work: the third determined to finish it, and died in ten days after.

The Curate of *Arna-le-Duc*, Normandy, after having breathed the infected air from the body he was burying, had a putrid disease, which reduced him to the last extremity.

The lord of a village, two leagues from Nantz, died. To place his coffin according to his friend's wishes, it was necessary to remove several coffins, among which was that of his relation. A most fetid odour spread itself in the church. Fifteen of the visitants died shortly after: the four persons who removed the coffins, died first: six curates, present at the ceremony, hardly escaped death.

The water of the wells below the cemetery of St. Louis, at Versailles, could not be used on account of its fetid mass.

At Lectoure, 160 miles S. W. from Paris, the opening of a body was followed by an epidemic.

In digging vaults in the church of St. Eustache, Paris, it was necessary to move some bodies, and to put others in a vault which had been a long time shut. Children who went to catechism in the church, and many adults, were seized with difficulty of respiration, irregularities of pulse, some of them with convulsions of the limbs.

From 1776, burials in towns and churches, is forbidden in France. In 1810, an Archbishop of Aix in vain solicited of the government the favor to be buried in his cathedral.

The following passage is taken from Campbell's Lectures on Poetry, published in the New Monthly Magazine:

"Hesiod summarily explains the origin of evil, by throwing all the blame of it on the weak sex. Superstition has seldom exhibited man in a more ignoble light, than as the author of this fiction—a wretched being, attempting to wreak his discontentment with life, on the character of a timid helpmate dependent on him, more alive to suffering, and doomed to suffer more, than himself."

From the last Pamphlet published by the Essex Agricultural Society.

COL. PUTNAM'S FARM.

Col. Jesse Putnam's farm is situated in the North Parish in Danvers, about six miles from Salem. It contains about 114 acres; to wit—41 of tillage—30 of pasture—and 13 of wet or low-ground meadow. His wood land is not in Danvers. Most of his tillage land is covered with orchards of apple trees; of which about 1200 are large enough to bear fruit; and 400 have been planted, or grafted, from two to six years. He raises his own trees in nurseries; which he renews from time to time, to supply his own wants. He considers the spring the best time for transplanting trees. In this operation he digs the holes four or five feet in diameter, and two feet deep; into which, in planting the tree, he introduces rich soil, that the tree may sooner recover from the check it receives in the transplanting.* By giving such dimensions to the holes, the roots may be regularly spread out in every direction, without being crowded. He disapproves of making nurseries in very rich soils; because they will generally be transplanted to poorer soils, and so be sensibly and injuriously checked in their first growth. He thinks it better to transplant from a poor to a rich soil, than from a rich to a poor one. Most of his trees are grafted with winter fruit. In selecting his fruits, he is careful to choose the kinds that are good bearers, as well as of good qualities; grafting over again, with other fruits, such trees as are not sufficiently productive. Col. Putnam has found it beneficial to young trees, to wash them in the spring with a composition of lime, clay, fresh cow dung and water; as it removes the moss, destroys the insects that find harbours in the rough bark, and gives a smooth, vigorous and lively appearance to the trees. He has found it serviceable to vary the manures applied to his trees, according to the nature of the soil. He has frequently sown barley, or other grain, around them, and when 18 or 20 inches high, dug it in. This he has thought one of the best modes of manuring them; and (as well as every other way of manuring) should extend to three or four feet from the tree, all round; continuing this practice at least until the trees have attained a good size, and are in a good thriving and bearing state.

For several years past, he has annually broken up three or four acres of his pasture land, where principally covered with small bushes and moss, and planted the same with potatoes or corn; and when laid down to grass found himself amply compensated.

It has been his practice to plough, in the warm weather in August, the land intended to be planted the ensuing spring; at which time it is cross-ploughed. By ploughing when the earth is warm, he says the sod is better rotted, and more easily rendered fit for tillage crops. Ploughing late in autumn he thinks not advantageous. Thus cultivated one or two years, the land will be in a good condition for English grain and grass. The same land will need to be broken up again, as often as once in six or seven years.

"The raising and curing English hay (he remarks) occupies a large portion of our time;

* In planting trees, the roots should be covered with earth at no greater depth than before their removal.

and rewards our labor as well as any thing that is done on the farm: and the object of cultivating other crops is, in a good degree, to prepare the land for this most important crop.

The produce of his farm, in 1821 and 1822, as near as he could estimate the same, he states as follows:

	1821.	1822.
English Hay	24 tons	30 tons.
Oats for fodder	3 do.	4 do.
[Wet] Meadow Hay	8 do.	7 do.
Barley for fodder	0 do.	3 do.
Indian Corn	70 bush.	150 bush.
Potatoes	500 do.	300 do.
Barley	70 do.	cut for fodder.
Onions	0 do.	150 bushels.
Carrots	40 do.	90 do.
Turnips	20 do.	150 do.
Cabbages	10 doz.	30 doz.
White Beans	2 bush.	7 bush.
Green Peas for market	4 do.	50 do.
Summer Apples	130 do.	150 do.
Winter Apples	600 do.	600 do.
Pork	2000 lbs.	2000 lbs.
Pumpkins	2 tons.	4 tons.

He kept no particular account of his dairy; but his cows, six in number, had done well.

Col. Putnam's mode of making manure, he states as follows:

"In the autumn I clear the barn yard, and carry the manure into large and compact heaps, in the fields where it is intended to be used. The yard is then covered with turf, loam, or pond mud, and such other materials as are found on the farm, suited to making manure. These, together with the droppings of the cattle in the winter and summer, and the relics of their fodder, are mixed together in the course of the summer, and made into fine manure. This I use principally on my grass land; spreading it from the cart, after the grass is grown several inches.

"I have a cellar under my barn, in which the winter dung and urine of the cattle are collected. By mixing with these, in the cellar, meadow turf (or sod) coarse hay and corn stalks, the quantity is much increased. I also carry large quantities of materials to my hog pen, which is so situated as to be kept moist; and from the industry of the swine in preparing this manure for the field, I find more benefit from them than in any other way."

His usual stock consists of six oxen, eight cows, one bull, two horses, and several extra cattle to be sold in the spring; and from six to twenty swine.

Col. Putnam closes his statement as follows:

"Some of my [wet] meadows have been converted into excellent English mowing grounds, by carrying about six inches of gravel on to them in the winter. In the first place I divide a meadow into lots about three rods wide, by ditches—turning the turf bottom upwards—and taking care to have the middle of the lots the highest, so that they may be a little sloping towards the ditches. Plough the turf and gravel together. In the spring, and plant it one season with potatoes: the crop will be as good as in common fields. Then carry on one or two inches of top soil, and a good coating of manure; and from land thus prepared, I have obtained my largest and best crops of English hay."

From the Morristown Palladium.

Observing that a premium is offered by the Agricultural Society, for the greatest quantity of butter from three cows, I shall throw together

a few unconnected observations, for the benefit of those who may be inclined to enter in the contest.

Although we all know what a good cow yet, for form's sake, it will be best to begin describing the chief points to be attended. She should have horns wide apart and smooth thin head and neck, large dewlap, full broad back, large but not fleshy udder, large teats, broad and fleshy buttocks, long and pliable. Good milkers are not very apt to grow fat, as the food runs to milk.

The size of the cows, and indeed of all bo: ed cattle, should be proportioned to the fertility of the ground; large for rich, small for poor on short pasture, a large beast will have time to rest and ruminate. It has been said that the longer any land has lain to grass, the better, and the more is the butter it will yield while the curdy substance of which cheese is formed, abounds more in clover, and new cold and moist pastures.

I must complain that the anxiety of our housewives to make butter, injures the calves, which are killed so young that their meat resembles fish rather than flesh. This might very easily be prevented, and the animals suffered to live a month longer without stopping the churn. After the first week let the calf be fed with skimmed milk, thickened with two or three handfuls of Indian meal, daily, and give it twice every day two balls as large as a hen's egg made of Indian meal, one egg, and a little fish seed oil. An experiment was made of two calves, the one was permitted to suck thrice a day, the other treated as above, and at the end of a month the last was the largest and the best. Attention to this method would not only improve our veal, but increase our butter. Calves fatten best in the dark, because light is an excitement which renders them restless.

The practice of milking thrice a day, especially when cows are in good pasture, is recommended; each milking will give almost as much as if only done twice, for, when the udder is full, the milk begins to be absorbed into the body of the animal. This practice will be found not only to increase the quantity of manure, but of milk.

Milk should be poured into pans as soon as possible, and if carried far, or much shocked, never gives abundant or good cream.

In order to find the richness of the milk from your different cows, pour the first of the milking of each into glass tumblers, and when the cream has risen, you can easily see which bears the thickest coat. Winter's milk, although less abundant, will be found to be richer than summer's.

Milk gradually increases in richness, from the first drop down to the very last. Take a tumbler full of the first, and another of the last; you will find that the first yields not one tenth part as much cream as the last; and the difference of its quality is as great as that of its quantity. She who by careless milking, leaves half a pint in reality, loses not only as much cream as the first five pints afford, but also all the part of the cream which gives richness and flavor to the butter, and dries up the cow into the bargain.

A milk pan should not be above three inches deep. The thickness and quality of cream is said to be much improved by pouring the ne

milk into a pan just taken out of boiling water, and covering it with another of the same.

It is said that a table spoon full of powdered altpetre, stirred, a few hours before churning, into as much cream as makes 12 lbs. of butter, will prevent the flavor of wild onion, and probably any other taste of foul pasture.

The cream that rises first makes the choicest butter; what comes afterwards is of an inferior quality. We may thus make two qualities of butter.

Butter cannot be made till the cream is somewhat sour; if you begin to churn before that time, half your labor is lost in souring it, which trouble a little vinegar, or one day's keeping will prevent.

The following receipt makes a sort of cream highly relished in every English farm house: Take common skimmed milk, beginning to sour, put it into a churn, and the churn into a barrel, which fill with hot water as high as the milk in the churn; cover all with a thick cloth, and let it stand six or eight hours. You will then find a thick sourish cream at top, which is esteemed a great delicacy when eaten with sugar. Underneath is a thin watery liquid which you separate from the cream as you please, but the best way is to draw it off by a spigot at the bottom of the churn. Nearly all the milk becomes cream, the goodness of which depends upon the sourness of the milk used, and the heat of the water in the barrel. For these no positive direction can be given, but a few trials will easily determine.

AGRESTIS.

NEW ENGLAND FARMER.

SATURDAY, MAY 10, 1823.

The Farmer's and Gardener's Remembrancer.

MAY.

PLANT MORE POTATOES.—Notwithstanding we are very friendly to Indian corn, as well as a variety of other crops which come into the customary rotations of our New England farmers, still we think the potatoe on the whole, the most valuable plant, which the bounty of Providence ever yielded to the necessities of man. In some situations, and on some accounts, we are inclined to the opinion that oats are a very proper crop to precede potatoes. A writer in the Massachusetts Agricultural Repository (vol. v. p. 331, 332.) says, "It appears to us best, all things considered, that the first crop after turning over sward, should be oats. The reason why an oat crop should precede a potatoe crop is, that it not only pays well by its product for the year's labor, but chiefly because it enables the husbandman to deepen his ploughing, preparatory to the second year's series in the rotation." Mr. Henry Stevens, likewise, of Barnet, Vermont, who appears to be a very judicious and experienced cultivator, in a communication, published in our paper (No. 33. p. 258.) says, "I make oats, principally, and generally speaking, my first crop in the line of rotation of crops;" and it appears from the same valuable communication, that corn, potatoes or turnips were, generally, his second crop. Potatoes, however, will answer a very good purpose as a first crop after land is broken up.

We have already, in No. 36, p. 236, given pretty copious observations relative to planting potatoes; still, we believe something more may

be profitably said on this subject. The land should be ploughed deep for this crop; because roots will commonly grow as low as the soil is stirred, and no deeper. And the more the ground is pulverized before planting the better the crop.

Perhaps green sward ground ought to be mentioned here as an exception. I have had the largest crops on such land even with one ploughing, and that just before planting. I account for it thus: Potatoes want air; such land affords it from the hollows under the furrows in no small quantity, both fixed and putrid, and in the greatest abundance towards the end of the summer, when they require the greatest quantity of nourishment. Those roots are accounted best for eating, which are raised without dung. I once had a middling crop, by putting a handful of old weather beaten salt hay in each hill. New land burnt, produces excellent roots, and a large crop, without any manure but what was made by the burning; sometimes not less than a peck in a hill.*

It is a fashionable, and we have reason to believe it to be a profitable mode of raising Indian corn and potatoes together in the same piece by planting rows or drills of each alternately. The advantages of this mode of culture are said to be these. Indian corn, in order to afford the greatest quantity of ears, requires to stand more widely separated, than it is when grown in the usual way; while, at the same time, other plants of smaller growth may be raised in the intervals, without essentially injuring the growth of the corn. In this way, we are told, that nearly one fourth additional product may be obtained.

We should, undoubtedly, be ridiculed if we were to direct to *soak* potatoes in water before planting them. We shall, therefore, give no such directions, but merely state a fact. A person told us he planted some potatoes which had been accidentally water-soaked by water running into his cellar early in the spring. He could not say how long they were immersed in water, but he said they were not fit for eating, and he apprehended that the vegetative principle was destroyed. He planted them, however, together with some of the same kind from the same heap, which had remained above water, and marked the hills where the soaked potatoes had been planted. The soil was dry, and the season, which followed, uncommonly so. The potatoes which had lain in the water flourished much better and produced much more abundantly than those which had remained dry. This accidental discovery, may, perhaps furnish a hint leading to a useful result. We would, at least, recommend to wet seed potatoes, intended for a dry soil, and then to roll them in plaster immediately before planting.

There have been many complaints that the best kinds of potatoes degenerate by being planted many years in succession, and it becomes necessary to seek new varieties. These may be obtained from seeds, but it is a troublesome process, and we believe, not always successful. We are assured by a practical farmer, that by selecting the largest and finest potatoes for seed, for a series of years, he found the kind to *improve* under cultivation. Here then is an important fact to corroborate what is stated in N. E. Farmer, p. 236, recommending the best and largest potatoes for seed.

* Deane's N. E. Farmer. Art. Potatoes.

Mr. Bordley says, "if maize [Indian corn] is 4 feet apart in the rows, and the interval ground between the rows 7 feet, the clusters or hills of maize are 1550, say 1500 on an acre. Between the hills of maize, in the rows, may grow cabbages or potatoes. One cabbage in that space; or two hills of potatoes, a foot apart. Along the intervals turnips 10 or 12 inches apart; or ruta baga the same distance, sown in May between the slope or space instead of cabbages." The intervals themselves may be sowed with turnips or ruta baga after the last hoeing of the corn, at any time previous to about the first of August.

A writer for the Bath Society papers, vol. iii, page 106, says, "The potatoe sets should be cut a week before planting, with one or two eyes to each, and the pieces not very small; two bushels to an acre of unslacked lime should be sown over the surface of the land as soon as planted, which will effectually prevent the attacks of the grub." Another writer in the same collection, vol. vi, p. 346, says, "Lime, marle, chalk, soaper's ashes and rags, do but little good; and in some instances do harm." We have no doubt but quick or caustic lime, put into the hill at the time of planting, or in any way coming in contact either with the seed potatoes or the growing plants, will corrode and injure them. But if applied to the top of the soil at the time of planting the potatoes, it will become so mild or effete as to do no injury to plants, but in many cases produce a great benefit as well to the soil as to crop. And if quick lime effects nothing more than the destruction of insects, its application is highly expedient. Some other writers recommend lime as a manure for potatoes on cold moorish soils. We think it worth the trial, with the precautions mentioned above.

Another British writer advises to cut large potatoes, when planted, into slips of about two ounces in weight each, and says that "large potatoes planted whole at any distance, and whole potatoes or pieces at a nearer distance than twelve inches in the row, send forth so many stems, that like cattle on over-stocked pastures, they starve each other, and the produce is dwarfish. Shoots, small pieces, and potatoes confined to one stem, or a very few, resemble cattle upon pasture not nearly stocked; which therefore, cannot make proper returns to the owner." He likewise asserts that "an acre of very large potatoes would require a quantity of seed so great as to deter any person from planting them; nor is it likely, that the productiveness of potatoes will continue to increase with their size. There is certainly a *maximum* and *minimum*, a *ne plus ultra* in the quantity of potatoe seed, as well as in every thing else. The middle sized of the human species, as well as the different species of other animals, are the best calculated to undergo labor and fatigue; they are, therefore, more perfect in their kind, and consequently fitter to answer all the purposes of their creation. May we not argue from analogy, that potatoes of a moderate size are the most perfect in their kind, and consequently the best fitted to send forth those vigorous shoots, which ensure a healthy progeny? This reasoning, he says, is confirmed by a great number of experiments made with whole potatoes, cut potatoes, and large and small potatoes." We do not wish to be responsible for the correct-

ness of this theory, but submit it to the consideration of our readers.

FIELD CULTURE OF PARSNIPS.—"The best soil for parsnips is a rich deep loam; next to this is sand, or they will thrive well in a black, gritty soil; but will never pay for cultivating in gravel or clay soils; and they always are the largest where the earth is deepest. Dry, light land is suitable for them, but wet, stiff or hide bound land is destructive. If the soil be proper they do not require much manure. The writer hath obtained a very good crop for three successive years, from the same land, without using any; but then he laid at the rate of forty cart loads of sand per acre upon a very stiff loam, and ploughed it in, he found it answer very well, from which he concludes that a mixture of soils may be proper for this root.

"It is most advisable to sow the seeds in drills at about 18 inches distant from each other, that the plants may be more conveniently hand or horse hoed; and they will be more luxuriant if hoed a second time and are carefully earthed so as not to cover the leaves."*

Parsnips are said to be a very valuable food for neat cattle, particularly for milch cows, which give milk in greater quantity and of a better quality when fed on parsnips than when supplied with almost any other food. They may be left in the ground through the winter, and are of great use for feeding cattle and swine in the spring before grass is grown, and may be boiled or steamed, tops as well as bottoms, for feeding hogs, till early potatoes are ripe enough to dig.

FORCING YOUNG FRUIT TREES TO BEAR.—Young trees may be made to show specimens of their fruit, sooner than they otherwise would, by making a cut in the bark a quarter of an inch wide, round the branch or bough which you wish to compel to bear fruit. The branch, however, is always injured, and sometimes destroyed, by this process. The best and safest way to effect the early exhibition of fruit in young trees or barren boughs, is to tie wires or strings about them tight enough to impede, in some degree, the circulation of the sap. This is less likely to injure the tree or branch than cutting off the bark, and is said to be equally effectual in causing the production of fruit.

* Bath Society papers, vol. iv, p. 252.

A correspondent of the N. Y. Commercial Advertiser recommends the planting of sunflower seeds, believing the leaves of these plants, which grow very large, have the property of absorbing the *miasma* or bad air in the atmosphere, and consequently purifying the air.

Vermont Copperas.—Dr. John Lock has given to the public a description of the Copperas mines and manufactory at Stafford, Vt. from which it appears that four men had manufactured one hundred tons of copperas in a year, besides carrying on the business of a small farm.

Glue.—An ingenious cabinet maker (says a late London paper) has, from long experience, proved that glue made from India rubber, is very superior to the common manufactured kind of that article, when used as a cement for furniture, and never gives way or loosens in the joints, which is too often the case with the glue made from animal paste.

PATERSON MANUFACTORIES.

Rejoicing in every circumstance which has a tendency to render our country independent of the rest of the world, and to develop its enterprise, ingenuity, wealth and resources, we cannot but hail with delight such intelligence as the following, let it come from what quarter it may; but we must, in candor, confess we enjoy it with peculiar zest when it relates to a portion of our native state, to whose prosperity and honor we are, from affection and gratitude, most heartily devoted. But to the information:

The "Voice of Passaic," published at Paterson, (New Jersey,) enumerates the following manufacturing establishments in that town:

Ten cotton factories, having now in operation twenty thousand spindles.

New factories erected, which, in about three months, will put in motion about twenty thousand spindles more.

Making 40,000 spindles employed in spinning cotton.

Three extensive woolen factories.

Two large duck factories, supplying in a great measure, our navy with canvass, and working up more than a ton of flax per day.

Three manufactories of machinery, one of which is stated to be the most extensive and complete in the United States.

Three very extensive bleach greens.

Two brass and iron foundries.

Besides paper, grist, saw, rolling, and slitting mills, &c. &c.

With the great natural advantages which Paterson possesses, and the prospect it has of deriving, at no very distant day, immense benefits from the contemplated canal from the Delaware to the Hudson, we may venture to predict that it will soon attain to a degree of usefulness and importance of which every Jerseyman may well be proud.—*True American.*

FOREIGN.

LATEST FROM EUROPE.

The packet ship *Corinthian*, in 35 days from Liverpool, has arrived at New York, bringing London papers to the 22d, and Liverpool to the 25th of March, inclusive. The following summary of their contents is from the New York Daily Advertiser:

The most important intelligence brought by this vessel is, that hostilities had not commenced between France and Spain. There appears to have been the same show of preparation, the same engagedness to begin the war at some time or other, but no beginning. The French army had not, at the latest advices, entered Spain. By an article in the *Courier* of the 22d, taken from a Bayonne paper of the 15th of March, it is said, "Almost the whole of the Duke of Angoulême's establishment is here, and his Royal Highness is expected before the end of the month." On the evening of the 19th of March, Lord Liverpool, in answer to an inquiry by the Marquis of Lansdown, said, "that the hopes which he in common with other persons entertained with regard to the maintenance of peace, had considerably abated; but it was not stated, neither could it be so stated consistently with truth and fact that all hopes were extinguished." Mr. Canning had previously said in the House of Commons, "that the hope of avoiding war, which his Majesty's government had previously cherished, was, if not totally extinguished, at least very remote, and receding fast from view." The editor of the *Courier* adds—"It is remarkable that Lord Liverpool did not say a word respecting the possibility of this country's keeping out of the contest."

It appears by the accounts, that there is much of the bustle of preparation in France, which certainly, under different circumstances, would satisfy any body that war was inevitable. Such would seem to be the pro-

bability; but it is equally certain that matters are managed differently in Europe from what they were formerly. Bonaparte's mode of proceeding was to march directly to his object; if necessary to save time he traversed a neutral country without ceremony, and made his declaration of war by striking a decisive blow in the heart of his enemy's country. The latest fashion is more slow and solemn—much parade is exhibited, much talk had, and a great display made of arming, collecting and organizing armies, and in some instances, after having marched and threatened and bullied, affairs have been hushed, and every thing blown over without a battle or even a skirmish. We are influenced more by the declarations of the British ministers, than by the appearances observable in France.

A decree passed the Spanish Cortes on the 5th of March, directing the government to interdict all commercial intercourse with Spanish ports to the Powers who had withdrawn their ministers from Madrid.—These orders have been received at Cuba, where French, Austrian, Russian and Prussian vessels are forbidden admission.

From France.—French papers have been received in New York as late as the 24th March. Great activity appears to prevail in the movements of armies towards the Spanish frontier.

The army of the faith, assembled in France and on the borders, amounts to 32,000 men. Preparation were making at Perpignan on the 22d, for the reception of the Duke D'Angoulême. It would appear from this movement that the Duke contemplated superintending the entrance of the French army from the Pyrenees, and subsequently would move to Bayonne which is at a considerable distance, to witness the march of the other division. The Duke was preceded by Marshal Moncey. The army of the faith is paid and fed by the French; and it is evident that more is calculated upon the effect of gold than from the force of arms.

Nothing of importance was transacted in the French Chamber of Deputies on the 22d. The opposition benches were empty.

Accounts from Vienna mention that Austria will maintain a strict neutrality, and this report has produced a considerable rise in their funds.

The factious bands of Navarre, to the number of 1000 men, forming three battalions, entered France by the mountains, about St. Jean Pied de Port, on the 11th, 12th and 14th. Charles O'Donnell has gone to supply them with arms, &c. The inhabitants had refused to give them quarter in their houses, which has caused some disturbance.

The Portuguese army is in full march for the frontiers, which they will pass the same time the French army crosses the Pyrenees.

Late accounts from Constantinople continue the assurances of peace with Russia, and that the commercial relations with that country were about to be restored.

From Portugal.—Letters from Lisbon to Feb. 22d, mention that a great scarcity of grain was experienced in Portugal, and that the ports were open for the admission of Indian corn, rye and barley; and it was expected would be for wheat.

Important from Mexico.—Papers have been received at New York, containing intelligence from Vera Cruz to the 8th of April. By this it appears that Iturbide is deposed, and a change has taken place in the dynasty of Mexico. Only 700 troops remained faithful to Iturbide, who had not only abdicated, but, contrary to the advice of his officers, had thrown himself on the mercy and generosity of the Congress. He was taken into custody, but remained at his seat near Mexico, under charge of General Bravo. He requested permission to retire to a foreign country, but was not allowed that privilege. It is thought that he will either lose his head or be doomed to imprisonment for life. The Congress of Mexico have named three individuals to assume the executive power.

Longevity of the Orange Tree.—There is an Orange tree still living and vigorous, in the orangery at Versailles, which is well ascertained to be 400 years old. It is called the *Bombon*, having belonged to the celebrated constable of that name, in the beginning of the 14th century, and was confiscated to the crown in 1522, at which time it was 100 years old.

Twelve days later from London.

The Ship Monroe arrived below New York on Monday evening last, in 23 days from Liverpool, bringing London papers to the 4th of April.

A Postscript to the Mercantile Advertiser of Tuesday, at 3 o'clock, A. M. contains the following:

DECLARATION OF WAR.

Sun Office, London, April 3. Second Edition.

Government have received the DECLARATION OF WAR BY FRANCE AGAINST SPAIN, as well as the Manifesto of the French Government on its armies entering Spain. How far Ministers may think proper to give publicity to these documents we cannot pretend to judge.

The Liverpool papers of the 5th appear to doubt the above intelligence, and state that no other London paper than the Sun published it.

The previous accounts stated that the French army could enter Spain on the 14th of April.

The King of Spain set out from Madrid for Seville, on the 20th of March, with a guard of 6000 men.

DOMESTIC.

At a term of the Circuit Court of the United States held in Portland last week, Jedediah Elliot and Jonah Austin, two old revolutionary soldiers, were tried on an indictment for wilful misrepresentation of the amount of their property made under oath, in order to entitle them to the benefit of the provision of the act for the relief of Revolutionary Soldiers. They had received their pensions since the first establishment of the act. It appeared on the trial that they both held leases of small farms in the town of Windham, the place of their residence, a knowledge of which they had suppressed. It was thought by many that the false representation was rather the result of ignorance than of premeditated rime. Austin was acquitted, and Elliot received the following sentence, viz: "that he should pay a fine to the United States of ten dollars, be imprisoned sixty days, and stand in the pillory one hour." The latter part of this punishment, the Court observed, was imposed because it was absolutely required by statute; but the District Attorney was requested to use his influence with the President to obtain the remission of that odious part of the sentence, which the Court had no power to omit or avoid.

The Mummy.—Messrs. Van Lennep & Co. of Smyrna, have sent to this city, by Capt. Edes, a Mummy.—It is from Thebes; and we understand is to be exhibited for the benefit of the Dispensary and the General Hospital.

Last week a Rose Bush, in a flower pot, was sold at auction, in this city, for \$11.50. Salmon were sold for \$1.50 a pound; and the first one brought to market this season (weighing 21 lbs.) was sold for \$40.

Eggs are sold in Philadelphia market at 8 cents a dozen. Beef, in the same market, prime pieces, are sold at 12 cents a pound.

A hoghead of Tobacco, raised in Frederic County, Maryland, and inspected in the city of Baltimore, a few days ago, sold for \$35 per hundred.

Rye and Potatoes imported.—The Electra, a vessel from London, brought one thousand barrels of rye to one house in Philadelphia; and Potatoes are brought to New York by most of the vessels from Ireland. We hope our New England farmers will soon be able to undersell the importers of the produce of their own fields.

Fishing in Rhode Island.—For some time past (says the last Providence American) our market has been plentifully supplied with fish of various kinds, which have been readily sold at good prices. A few days since, one of our enterprising fishermen took from the river above Central Bridge 3000 pounds of fine bass at one haul.

A Mr. Gent, of Abbeville, (S. C.) upon a bet of 100 dollars, lately made in one day, between sun-rising and sun-setting, seventy five bed-screws, with their taps complete, equal in size and quality to those usually imported.

A house in New York was lately set on fire by an East India Cracker fired by a lad from an adjoining yard.

The Pirates.—It would appear by the following article from the Albion, that the late statements respecting the destruction of Pirates, have no foundation in truth.

"A letter has appeared in several papers dated from the United States' ship Decoy, off Havana, April 1, which mentions that the crew of his Britannic Majesty's frigate Hyperion were instrumental in capturing the pirates who had escaped from La Cata, taken by the Grecian armed cutter.

We have good authority for saying that the Hyperion was on the other side of the Island of Cuba, and the story of course, respecting the "captain in his gig," has no foundation in fact. There were twenty or thirty horses on shore ready for the pirates, most of which were mounted by the British tars, who pursued the villains into the woods. Among the pirates were two Americans, one of whom being wounded and unable to escape, in a fit of desperation ran his sword through his heart, and the other to avoid the fate which impended over him, cut his throat in the presence of the sailors.

It is asserted that the schooner Fox has reported, that "they had taken and destroyed the greater part of the pirates on that part of the coast." At the date of the sailing of his Majesty's frigate Athol, which we believe is the latest arrival from that quarter, one vessel only, the Pilot, had been taken from the pirates, and but one man captured in her. There is no truth in the story of the British gun brig having been captured by the Pirates."

Lieut. Com. Henley, late of the Ferret, has returned from the West India station, on account of ill health. He states that Com. Porter had made such arrangements, as would enable him to receive information from, and communicate with every detachment of his squadron with the greatest expedition; and their cruising ground had been so allotted, as to afford the greatest security to merchant vessels, by convoy, and the most prompt assistance in cases of aggression from the Pirates, to all vessels going to or coming from ports on the North side of Cuba. Lt. H. also states, that the rendezvous at Allenton was very pleasant, and the soil capable of producing every description of vegetable productions, though the water was not good. A navy hospital was to be erected, under the orders of Surgeon Williamson, about two miles from Allenton, where the water was pretty good. A hotel was also to be established by one of the proprietors of the Island.—Gazette.

John Dodge, Esq. of the house of Marple, Dodge & Co. established at Cape Haytien, has arrived passenger in the Victory, from that place, and reports favorably of the peace, prosperity, and general happiness of Hayti; he speaks in the highest terms of the justice and magnanimity with which the government is administered; and of the great influence which the example of the public officers had given in the encouragement and promotion of Agriculture—the rich and golden mine of the country. He also states, that the recent proclamation of President Boyer, interdicting all commercial intercourse, or trade, with the neighboring Islands, will operate greatly to the advantage of the U. States, as being the nearest foreign country, and capable of supplying the Haytiens with every article they may want, either of foreign or home fabrics, or the productions of our native soil, at the earliest moment.

A Pelican was wounded and taken in the Alleghany River, at this place, on Tuesday last, by Mr. Sheldon. He shot at it from the Bridge, broke one of its wings, and took it in the river, below the Point. This immense bird measures from the tip of the bill to the end of the tail, 5 feet 1 1-2 inches; from tip to tip of the wings, 3 1-2 feet; in height of the body 1 foot 7 inches; neck 1 foot 6 inches long; head and bill 1 foot 3 1-2 inches; mouth 1 foot 6 inches; round the body 3 feet. The pouch under its mandible would contain 3 quarts. The bird is very poor, and not supposed to weigh 16 pounds.—Pittsburgh, Pa. paper, April 25.

Yellow Jessamine flowers poisonous.—On Sunday the 20th April, a small child of Mr. James Broughton, of Edenton, N. C. aged about two years, after eating a number of Yellow Jessamine Flowers, died in the space of half an hour. In a minute or two after eating them she became perfectly blind, and expired in the time above stated.

It is stated in the Nantucket Inquirer, that there were imported into Nantucket and New Bedford, during the year 1821 and 1822, comprising the average term of one whaling voyage, in about a hundred vessels owned in those ports, upwards of 4,000,000 gallons of whale and sperm oil.

Mr. English, the American traveller in Egypt, relates the following circumstance.

"I saw to day," he says in his journal, "a singular mode of navigating the river (the Nile); a man who apparently was travelling down the river with his whole family, had placed his youngest wife and her two young children on a raft made of bundles of corn-stalks (stems of Helcus) lashed together; he himself swam by its side to guide it, while he kept his old wife a swimming and pushing it by the stem; and in this way they proceeded down the river."

TREE BRUSHES.

FOR SALE, at the Agricultural Establishment, No. 20, Merchants' Row, opposite the east end of the Old Market, a few of those highly and much approved TREE BRUSHES, for destroying Caterpillars, and which have been so highly recommended by the Hon. Timothy Pickens, in his communication to the Essex Agricultural Society. May 10.

FOR THE NEW ENGLAND FARMER.

INVOCATION TO SPRING.

[Written during a North-east storm in May.]

Daughter of Zephyr and the Solar Ray,
Thy fairy footsteps please to print this way.
It is a long while since our clime you visited,
Though never lady has been more solicited.
Why stand aloof, and veil thy beauties thus,
As if thou wert too exquisite for us.
Yet deign to dwell with Afric's tawny train,
While the swart Ethiope woos thee not in vain.
Why dangling thus about the torrid zone,
While Flora, Ceres, and Pomona moan
Thy long protracted absence? Miss, I fear
Thou hast forgotten to adorn the year,
As thou wert wont with wreaths of fragrant flowers,
For thou didst give us nought but leafless bowers
And sorry evergreens the first of May,
Wherewith to celebrate thy holiday!
Why should we shiver thus, week after week,
Exposed to Boreal blasts so very bleak,
That while we shudder under their control,
We think them missionaries from the pole,
Sent here by some Satanical device,
In order to convert us—into ice?

Is it for any sore neglect of ours,
That we're half frozen in the month of flowers?
If so, accept this Ode upon condition
It makes atonement for our sad omission;
Receive this trifle for the donor's sake,
The best peace offering he knows how to make.

My almanac has prophesied thy coming,
But sure the rogue who made the thing was humming,
Leagu'd with some selfish seedsman I'll be bound,
Who wish'd our seeds all rotted in the ground,
That so our horticulturists might hop
To get a fresh assortment from his shop.

The earth, the sea, the atmosphere and sky
All seem to give our calendars the lie,
Which call this Spring, when every body knows
Winter still rides on every breeze that blows.
Now half resolv'd, the other half aghast,
Still shrinking from th' intolerable blast,
Still shuddering at the gelid north-east storm,
Spring half discloses her scaphic form;
But like some moody half-pleas'd nymph appears,
Whose smiles just lighten through a cloud of tears.

Spanish Inquisition.—A statement has recently appeared, of the number of victims to this terrible engine of superstition, cruelty and death, the bare recital of which chills the blood, and fills the mind with horrid images of suffering humanity, under the most excruciating tortures, which awful depravity, disguised in the robes of religion, could invent. The table is extracted from a critical History of the dreadful tribunal, by J. A. Lorente, one of its late Secretaries, and may therefore be considered as indisputably authentic. It exhibits a detailed list of the respective numbers who have suffered various kinds of punishment and persecution in the Peninsula alone, independent of those who have been its victims in other parts of the world, for a period of three hundred and fifty-six years, viz. from 1452 to 1808, when the Inquisition has existed, under the administration of forty-four Inquisitors General. Within that term, it appears that in Spain have been burnt, thirty-one thousand seven hundred and eighteen: died in prison, or escaped by flight and were burnt in effigy, one hundred seventy-four thou-

sand one hundred and eleven; and suffered other punishments, such as whipping, imprisonment, &c. two hundred eighty-seven thousand, five hundred and twenty-two; making a grand total of eight hundred, thirty-six thousand, six hundred and fifty-one. The greatest number of victims under any administration, was that of Terquemada, the first Inquisitor General; who presided from 1452 to 1499, a long and bloody reign of forty-seven years, during which, eight thousand eight hundred victims were burnt, six thousand four hundred died or escaped by flight, and nine thousand ninety-four suffered various other punishments; being in the whole, one hundred five thousand two hundred ninety-four, or two thousand two hundred forty per annum.

N. Y. Statesman.

Where true wisdom is, there surely is repose of mind, patience, dignity, and delicacy. Wisdom, without these, is dark light, heavy ease, sonorous silence.

A great talker never wants enemies; the man of sense speaks little and hears much.

The father of the British Lord Abington, who was remarkable for the stateliness of his manners, one day riding through a village in the vicinity of Oxford, met a lad dragging a calf along the road, who, when his Lordship came up to him, made a stop, and stared him full in the face. His Lordship asked the boy if he knew him. He replied, "Ees." "What is my name?" said his Lordship. "Why, Lord Abington," replied the lad. "Then, why don't you take off your hat?" "So I will, Sur," said the boy, "if ye'll hold the calf?"

BELLFOUNDER,

The Wonderful Norfolk Trotter, imported July 1822, from England,

WILL STAND THIS SEASON, 1823,

At Twenty Dollars, and One Dollar the Groom. The money to be paid to the Groom at Covering.

THIS celebrated Horse is a bright bay, with black legs, standing 15 hands high; his superior blood, symmetry and action excel those of every other trotting Stallion. He is allowed by the best judges in Norfolk to be the fastest and best bred Horse ever sent out of that County. He has proved himself a sure foal getter, and his Stock for size and substance are not to be surpassed; they are selling at the highest prices of any Horses in Norfolk.

BELLFOUNDER was got by that well known, fast and high formed Trotter, OLD BELLFOUNDER, out of Velocity, which trotted on the Norwich road, in 1806, *Sixteen miles* in one hour, and though she broke fifteen times into a gallop, and as often turned round, won her match. In 1808 she trotted *Twenty-eight miles* in one hour and forty-seven minutes, and has also done many other great performances against time.

BELLFOUNDER, at five years old, trotted *Two miles* in six minutes, and in the following year was matched for 200 guineas to trot *Nine miles* in thirty minutes, and he won easily by thirty-two seconds. His owner shortly after challenged to perform with him *Seven miles and a half* in one hour, but it was not accepted. He has since never been saddled or matched.

OLD BELLFOUNDER was a true descendant from the original blood of the *Fireways*, which breed of Horses stands unrivalled, either in this or any other Nation.

BELLFOUNDER is strongly recommended to the public by the subscriber, as combining more useful properties than any other Horse in America, and will stand, during the season, at his Stable in Charlestown, where all inquiries, post paid, will be attended to.

SAMUEL JAKES, JR.

Charlestown, Mass. April 25, 1823.

AGRICULTURAL ESTABLISHMENT.

NO. 20, MERCHANTS' ROW,

At the East End of the Old Market.

FOR sale as above, a variety of the most approved single and double mould board Ploughs, C. Howard's improved cast iron mould board, with wrought Shear and Coulter,
Cast iron do. do. do.
J. Seaver & Co's. do. do.
Bigelow's wrought do. do.
Warren's much approved common Ploughs,
Sinclair's side hill do. do. do.
Howard's much improved Cultivator, an implement highly esteemed for its use and utility in drill cultivation,
Beatson's Scarifier,
Bennet's Broad Cast,
Seed Sowing Machines, calculated for large and small seed,
Eastman's improved Straw Cutter,
Safford's new invented Straw Cutter, much improved,
Common hand Straw Cutters,
An English Vegetable Cutter,
Stevens' patent steel spring Hay and Manure Forks,
Steel spring Potatoe Hoes,
English cast steel broad Hoes,
Common and steel do. do.

A great variety of Garden and other Agricultural Implements.

Tree Brushes, for destroying Caterpillars, an article highly recommended for that purpose, by the Hon. Timothy Pickering, whose communication on this subject appeared in the New England Farmer, April 26, page 309.

May 3.

AGRICULTURAL & HORTICULTURAL SEEDS.

JOSEPH BRIDGE, No. 25, Court Street, has just received, per London Packet, a variety of

GARDEN AND FIELD SEEDS,

which added to his former extensive assortment, makes the most complete variety, probably in the U. States. Among them—300 lbs. Carrots, 200 lbs. Beets, 50 lbs. Mangel Wurzel, 200 lbs. Ruta Baga, 30 bush. Peas, 100 Raddish, of sorts; Lettuce, Cabbage, Cauliflower, Kale, Brocoli, Sweet Marjoram, Thyme, Summer and Winter Savory, Sage, Hyssop, Fennel, Dill, Salsify, Scorzonera, Endive, Red and White Clover, Red Top, Foul Meadow—with an extensive collection of Flower Seeds, Bird Seeds, &c.

GARDEN TOOLS, viz: Pruning and Budding Knives, Pruning Saws, Transplanting Trowels, Garden Reels and Lines, Edging Irons, &c. Flower Pots constantly on hand.

May 3.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the Publisher) until arrearages are paid.

Complete files from the commencement of the paper in August can be furnished.

Agents who procure seven subscribers, and become responsible for the payment, will be entitled to a copy gratis, and in the same proportion for a larger number.

NEW ENGLAND FARMER.

PUBLISHED BY THOMAS W. SHEPARD, ROGERS' BUILDINGS, CONGRESS STREET, (FOURTH DOOR FROM STATE STREET.)

VOL. I.

BOSTON, SATURDAY, MAY 17, 1823.

No. 42.

From the Mass. Agricultural Repository.

The following letter from the Hon. John Welles, to the Corresponding Secretary, on Forest Trees, relates a subject of the greatest importance to the State of Massachusetts, a State destined to become very populous by its industry, its capital, and its superior advantages of all descriptions for extensive manufactures.—The best mode of preserving our wood-lots from decay, can be ascertained only by extensive and frequently repeated experiments. No man in New England has enjoyed greater opportunities than Mr. Welles, of making and witnessing such experiments.

I some time since, in a communication to the Agricultural Society, made some observations upon the growth and culture of the apple tree, (No. 1, vol. 6) with a view of stating from experiment how the natural disadvantages of soil might be counteracted.

It is now my intention to resume the subject, for the purpose of leading to a more general inquiry as to the laws which govern and regulate vegetable life, as well in that majestic production of nature, the Forest Tree, as in the fruit-bearing tribes.

How then amongst us is vegetable life affected by climate? How, by other causes? and what the duration of the several kinds of Trees?

That these questions may be rightly answered, known facts are to be collected from the observing; and such results must be obtained as may lead to the most accurate decision of which the subject is susceptible. Thus, whilst in this great process of nature, general knowledge is enlarged, it becomes the immediate source of practical utility. Or in other words, experience, gathering strength as time passes by, becomes our unerring guide. Much has already been done by the publication of extracts from Lichaux, relating to the varieties in the American forest. But if with a like zeal we can obtain from others of the present time, whose information is competent, known facts as to the age of trees; there is no doubt sufficient knowledge might be had, to establish a general system accurate enough for every wished for purpose.

And why should not the laws which influence vegetables, be as definite as those which govern animal life? What one generation cannot do, let two effect. And as to exceptions, let it be remembered, that they do not disprove but establish general laws.

A time will come (especially if coal is not found more abundantly with us) when from the increase of our population and our manufactures, the cutting off and the re-growth of our forests, or to use a more appropriate term, our wood lots, will form an important subject of calculation. It will be desirable to estimate with precision, at what period the earth will again present a renewed growth; as well as the most beneficial time and mode of using the axe. Some indeed may be so favored with length of days as to avail themselves of this labor of the earth more than once. But if not to their successors and to the community, the subject is highly important and replete with interest. The diversity of opinion on these topics, and the occasional and scattered instances of the great longevity of trees, while they

render the subject more intricate, make it also more essential as a topic of enquiry. These variations from the general law in this country, as well as other similar ones in past ages and in the present times, should form no impediment to the general rule.

As relates to our forests or wood land, it is a fact generally known, that where they are cut off and a renewed growth is wished for, if they are of hard wood, they should be cut when the sap is down, or the leaf off the tree. This being mostly in the winter season, is most convenient to our husbandmen. It is considered as very essential by European writers as well as some of our own country, that trees should be cut as near the ground as possible, as a means of throwing back the suckers more toward the roots. This practice is dictated also by economy as a saving of the best part of the wood and timber. In the publications of the Scotch Agricultural Board, by Sir John Sinclair, it is observed, "that of the trees which being cut down send forth no shoots, are the beech and the whole family of the pines." They are considered in Europe "as limited to one generation." There is a mode here, however, as to the latter tree which has the effect of producing a succession. After cutting off a pine lot, the plough is introduced, a crop of rye is obtained beneficially, and the seeds of the pine which were on the surface being thus buried in the soil, a new and rapid growth is produced. This is aided if one or two middle sized seed-bearing trees are left on an acre. It is said that in some parts of our country there is a change or a succession of different growths, even of different genera or families. Upon this seeming incongruity I cannot reason, from want of experience.

As to the important principle, at what age or how often it is best to cut off our wood, we should on the whole be disposed to name a period between 40 and 50 years, as most favorable for what is termed hard-wood trees. The writer here refers not only to a variety of facts as to lots in different parts of this state, but to opinions of many judicious farmers. This is corroborated by a number of experiments, where portions of a lot have been cut off at the period of time above stated, and the product of which considerably exceeded that of other parts of the same lots, which had been left standing, in the aggregate quantity upon an acre. This was the more discernible where the ground had been cut clean; a practice which cannot be too highly recommended.

By the agricultural reports before alluded to, it appears that in the lots reserved for wood (called coppices) it is considered as most profitable to cut off the growth every 40 years. It will be perceived that for this country a longer period is inclined to.

As to the pine, that called the pitch pine, (*Pinus Rigida*), is the prevailing growth in this State. The general opinion is that it may be cut to advantage once in about 40 years.

Though trees may shoot up in height by standing longer, yet the period of most rapid vegetation is mostly over, and by this means

much of the under growth is necessarily destroyed.

It may be here remarked, that those trees which took their start in the earlier stages of vegetation on our soil, and have grown separate, have put at a distance all competition. Having the advantage of extent of ground, air, light, &c. besides being more valuable as timber, they have attained greater age and size than has been since known.

One observation will tend to the vindication of our country from that censure, which has been bestowed upon us by some superficial travellers. We have been condemned as evincing a want of taste in cutting off our forests without leaving what it would take a half century to produce, a shade near where it is proposed to erect buildings. The fact is, that trees of original growth have their roots mostly in the upper stratum of earth and near the surface. A tree acts upon its roots, and is acted upon by the wind, sustaining in common with the whole forest the force of this element, and it becomes accommodated or naturalized to the pressure. But when left alone or unsustained, it is borne down by the first gale, often to the injury of property, and even of life. It is true wisdom therefore, that induces the settler to cut or girdle the whole growth, that a danger so serious may be avoided.

Considering the oak as the monarch of the wood, we begin where this tree predominates. From a careful examination of several lots of considerable extent, which have been cut clean, and where there could be little doubt that the growth was, as it were, primeval; not more than seventy rings could be discovered. As the outer rings were not very distinct, it may be fairly inferred, that many years might have passed by without this indication of increase. The result seems sufficient, more especially if it shall be confirmed by coincident facts, to establish the preceding hypothesis; that it is generally most beneficial to cut off our wood lots at some period between forty and fifty years; varying the rule somewhat as circumstances may dictate.

Where lots are left for a much longer period, or where the old trees are gradually selected as wanted by the proprietor, the growth becomes more and more feeble.

The English writers generally lay down a different result from what appears to be the fact in this country as to the growth of wood.

First they assert, that after a period of about fifty years the forest trees will not shoot anew after being cut over. This is so far from being the case here, that it is believed that scarce an instance has occurred, where lots are fenced and cattle are kept out, but that a new growth has rewarded the owner of the soil. In several lots of old growth upon Blue Hill in Milton, it was predicted that there would not be a new growth. The wood was cut off in about 1800, and there is now a fine vigorous succession of the same sort of trees.

Old lots, when the wood is taken therefrom, are too often left exposed as pastures or in commons; the roots are surcharged with sap; the

FOR THE NEW ENGLAND FARMER.

MR. EDITOR,

The time of planting reminds me of a question not yet settled to the general satisfaction of farmers. I have reference to seed potatoes, whether they should be planted whole or cut into pieces. Experiment affords the only criterion whereby we may form conclusions in cases like this, and it would be well if more were made public that we might be the better enabled to judge. I will therefore state one which will perhaps throw at least a single ray of light on the subject, among the many that illuminate your paper on the most important occupation of man.

In planting my potatoes the last season, I had the seed cut into two parts, without regard to the seed end, and planted three pieces in a hill; but as the hills and rows were very near together, I found when I had planted about two thirds of the field, that the seed thus prepared was all expended, and not then having time to cut more, I planted the remainder of the ground with whole potatoes, one in each hill, and of the larger size. The season, in this quarter, was not fruitful in potatoes, the usual produce being short of a medium crop. A rust almost universally struck them throughout the country some time prior to their maturity. Those of mine above mentioned, suffered with others, but a difference in the appearance of the vines, between those from the whole seed and those from the cuts, early attracted my notice: the former being apparently much less affected by the rust than the latter. All the time of harvesting, the vines of the cut seed were entirely dry, while those of the whole seed retained some considerable juice and greenness of appearance.

In digging these potatoes, we found that part of the field planted with whole seed to yield much more abundantly and much larger potatoes than the other part. The soil and the cultivation were alike in all respects, no other manure having been applied than leached ashes spread and ploughed in, and plaister dropped on the seed.

This experiment affords an argument against the very prevalent opinion in favor of cutting seed potatoes; and it has, in my estimation, the more force from its accordance with the general order of nature, on which all true theories must be founded.

My object in making this short communication is to elicit others on the question of more importance, and from sources more worthy of notice. The potatoe, although a humble root, is one of the most important productions in our whole system of agriculture.

Buckfield, Maine, May 10, 1823.

From the Portland Gazette.

Recipe for making good yellow Butter.

A gentleman from Scotland has lately called at this office and requested us to promulgate the following recipe for the benefit of those farmers who supply our market with butter.—He was led to make the suggestion in consequence of having noticed that our butter made after the cattle are put to hay, is almost universally white. He says that in his country the dairy women avoid this by grating some orange carrots, the juice of which, after being strained, is mixed with the cream previous to churning.

Butter thus manufactured acquires not only beautiful yellow color, but a flavor which adds greatly to its value. The quantity of carrot juice necessary to be used for this purpose may easily be ascertained: indeed the judgment of the manufacturer cannot fail to suggest very nearly the quantity necessary to give it a proper color.

Art of dressing Flax so as to resemble Silk, as practised in Germany.

Take one part of lime, and between two and three parts of wood ashes; pour over them due proportion of water to make a strong and sharp lye after they have stood together a night, which must be poured off when quite clear. Tie handfulls of flax at both ends, to prevent its entangling, but let the middle of each be spread as open as possible, in a kettle on the bottom of which has first been placed little straw with a cloth over it. Then put another cloth over the flax, and so continue covering each layer of flax with a cloth, till the kettle be nearly full. Pour over the whole the clear lye, and after boiling it for some hours take it out, and throw it in cold water. The boiling, &c. may be repeated, if judged requisite. The flax must be each time dried, hauled, beaten, and rubbed fine; and, at length first dressed through a large comb, and then through a very fine one. By this process the flax acquires a beautifully bright and soft thread. The tow, which is beaten off, when papered up and combed like cotton, is not only used for many of the same purposes, but makes an excellent lint for wounds.

Mode of Whitening Straw.

In 1806, a new method of whitening straw was discovered in Germany. This consists in steeping it in muriatic acid saturated with potash. The straw, thus prepared, never turns yellow, is of a shining white, and acquires great flexibility.

Preserved Strawberries.

To one pound of ripe strawberries put one pound of powdered loaf sugar, laying alternately on a deep dish a layer of each. Let them remain thus for twenty-four hours, when beat them in a sirup till they are all of a color. In order to determine when they are done enough cut one of them open. Then, taking them out, boil the sirup to the consistence of a jelly, let it remain till cool, then put in your strawberries, and let them boil up once, take them out and when cool, put them into a pot for use.

Hop Beer.—For a half barrel of beer take half a pound of hops and half a gallon of molasses; the latter must be poured by itself in the cask. Boil the hops, adding to them a teacupfull of powdered ginger, in about a pailful and a half of water, that is, a quantity sufficient to extract the virtue of the hops. When sufficiently brewed, put it up warm into the cask shaking it well in order to mix it with the molasses. Then fill it up with water quite to the bung, which must be left open to allow it to work. You must be careful to keep it constantly filled up with water whenever it works over. When sufficiently wrought to be bottled, put about a spoonfull of molasses into each bottle.

shoots, when they rise up, are of rapid growth, tender, and nutritive; they are cropped by cattle and sheep, and the erroneous conclusion above stated is too hastily drawn, in this country at least. The next point, upon which we must dissent, is this. That "the trimming of wood lots is beneficial." True it is, that some of our farmers think that the stumps of their trees may be deprived of a portion of their numerous suckers for a few years. They are used to serve as hoop poles. Perhaps from the necessity of the case, and the situation of the country, this may be justified. But experience here seems fully to establish it, that wood lots should not be trimmed in the manner recommended by the English writers, for the purpose of letting in the air and light. In a variety of instances where this has been done, the consequence has been that the leaves have been blown away, which would have made the land lie light and nourish the roots. A thick grass sward has been formed, and the lots have been stunted in growth, and most essentially injured.

There is no doubt that in the family of the oaks there is a great difference in growth and duration. The red oak (*Quercus Rubra*); the grey oak (*Quercus Ambigua*); the swamp white oak (*Quercus Prinus Discolor*); in forests attain their growth sooner than the white oak (*Quercus Alba*.) The latter tree spreads its limbs parallel nearly with the earth; by engrossing a greater extent of soil it has the benefit of better nutrition. As it seldom predominates in the forest in close growth, it does not perhaps mature much under from 60 to 80 years, and when in single and favorable situations, it requires a much longer period. The Chesnut of the U. States (*Castanea Vesca*) is a long lived tree, but less so than the white oak; it grows to a large size and is valuable for timber. In Scotland, they conjecture some of their Chesnut trees to be nearly three hundred years old. As has been before observed, the white oak and the elm, in common with all other trees when well situated in cultivated grounds, and near roads and houses, attain great and protracted age, and must be considered as forming (if not exceptions) classes of cases by themselves, not interfering with that system under which we place our forests and wood lots.

I feel that I owe an apology to you sir, as well as your readers, for the length of this communication. My object has been to excite an attention, which is becoming more and more important as to our wood lots, and I feel desirous of bringing those forward who are better informed. As it may furnish, however, some amusement to the curious, and lead to the general benefit and ornament of the country to adorn our highways and pleasure grounds with trees in rows and otherwise, I shall subjoin a variety* of instances of the size, age, &c. of several in this neighborhood and elsewhere, which will serve to show what an astonishing increase time insensibly effects in this wonderful product of the earth.

I am, Sir, respectfully yours, &c.

JOHN WELLES.

* This Appendix was necessarily omitted, but will appear soon.

To remove the stain of Cherry or Claret Wine.—Apply a solution of sal ammoniac in lemon or lime juice to the spot, and in a short time it will disappear.

From the American Farmer.

IMPROVEMENT IN THE CONSTRUCTION OF BEE HIVES.

Newburyport, March 3, 1823.

John S. Skinner, Esq.

DEAR SIR—I observed in your paper, No. 48, p. 14th,* an extract from the National Gazette, commending the method practised in Germany, of gathering honey, as being easier than that of India, and more merciful than that of this country, which induces me to think that Blake's patent Bee Hive had never been examined by the writer—as honey can be taken from a hive of that kind, and if too much be

taken the bees can be furnished without using in one case herbs, gloves, cap and mask; and in the other lifting the hive to feed them from a saucer—and besides it is well known, that most of the white comb is put in the top, therefore in taking out a box, as described by the plate, and replacing it by another, the bread &c. of the bees is not disturbed. I enclose you a drawing of the hives, a copy of the schedule referred to in his letters patent, and making part of the same, containing Mr. Blake's description of his improvement in the construction of the bee hive.

value; and in which all the French Agriculturists, who know how to appreciate your useful lessons, would participate with me.

*I have already met with some words, of which I do not well know the meaning; for instance, I do not know what is the insect called *wire worm*. I have not been able to ascertain it, nor even to approximate what it can be, as it does not extend its ravages with us, to grain sown on clover, when ploughed up, as is the case in England. I do not know either, what is the plant called *rib grass*, of which I have not yet seen the botanical name given. Perhaps, indeed, it may have escaped me while reading, and I may find it out in the continuation of the translation.

"This work, to which, notwithstanding its importance, I am only able to devote a short time every day, will still require three or four months; but I hope it will be published about that time.

"I beg that you will accept the expression of the respectful sentiments, with which I have the honor to be, Sir, your very humble and obedient servant.

(Signed) MATTHEW DE DOMELLE *ainc.*"

From the Trenton Emporium.

HOW TO PRODUCE THE BEST OF FRUIT.

Take a scion from a tree, the growth of the preceding year, of the choicest fruit to be found—cut this scion into pieces of two, three or four inches in length, dip the ends cut in warm resin so as to prevent the sap issuing out—plant the pieces in soil suitable for an orchard. A number of shoots will spring up; from these select the most thrifty for growth, lop down the remaining shoots and cover them faithfully with earth, and in a short time they will become roots to nourish and hasten the growth of the tree. An orchard may be produced in this manner at least two years sooner than from the seed.

DANDELIONS.

A medical writer in the National Intelligencer remarks:—"Dandelions have always been considered *peculiarly useful* in visceral obstructions, particularly those of the liver, when eaten either as greens, salad, or taken in ptisans.—They seem calculated, from their stimulant deobstruent powers, to promote bilious discharges, and, from long experience, have been found highly efficacious in all biliary affections of the liver. They are also good to keep the body open, and are diuretic and attenuant. In the dropsy, the dandelion has been known for ages to be of great utility. The ancients, says Willich, were better acquainted with the properties of this excellent vegetable, than those modern practitioners who appear to be more anxious to introduce exotics, imported from distant countries, than to ascertain the qualities of those numerous medical plants which grow in our own climate. I advise all who are troubled with bile, flatulencies, fullness of blood, and who are fearful of dropsy, vertigo, &c. to make free use of this precious gift of nature, the Dandelion.

Information to the Ladies.—Plaid stuffs will neither shrink nor lose their lustre, by the following simple method of cleaning them.—Wash them with soap and cold water, and starch and iron them before they are dry.—*Ch. Courier.*

"This improvement consists in the construction of a hive, so that any quantity of honey, from a very small portion, to nearly one third part of the whole, may be extracted at any time from the hive, without any serious injury to the bees, or without the destruction of any of the combs of those valuable little animals, and so that whenever there is a deficiency of honey for the support of the bees, or no more than is necessary for the purpose, it may be supplied or taken away at pleasure. Let a square box, of the size of the common hive, or any other convenient size, be made of pine, or any other suitable wood. Let a number of bars be placed horizontally, at about one third part of the distance from the top of the hive, so that the space between each bar shall be about two-fifths of an inch. Let any number of separate boxes, say

nine or more, or less, be so made, that they shall fill up the whole space between the bars mentioned, with any convenient thing inserted in the tops of the boxes, for the purpose of extending them at pleasure, and let there be a cover to be placed over the whole, in such a manner as may be thought most convenient."

(Signed) EDWARD BLAKE.

I would also observe, that I have several of these hives preparing, and am confident they will answer a valuable purpose. The cost is very trifling, and those who purchase the rights of vending to the several states and counties, charge only about two dollars, to each farm or individual for the privilege. Mr. Blake's residence is in the town of Hartford, County of Oxford, state of Maine, unless he has removed within a few months.

Respectfully, your obedient,
BENJAMIN POOR.

*For the same article, see N. E. Farmer, p. 322.

TRIBUTE TO MERIT.

Translation of a letter from Monsieur de Domelle, President of the Central Agricultural Society of Nancy, to the Right Hon. Sir John Sinclair, Bart. dated Nancy, 7th Nov. 1821.

"SIR—I have the honor to inform you, that on the 3d of this month the Central Society of Agriculture of Nancy, has inscribed your name on the list of its Foreign Correspondents. The Diploma shall be transmitted to you without delay. I hope that you will not refuse the lustre which your name would procure it, to a Society now in its infancy.

"I beg leave here to express all the satisfaction which I experience, in a choice so honorable to the Society; and to add, how much I am personally flattered, with the sort of brotherhood, which this gives me, with the person,

whom I consider to be the first agriculturist in Europe.

"I have been occupied, Sir, for some time, in translating your excellent "Code of Agriculture." If any thing can contribute to raise Agriculture in France, to the rank of a science, which we could not till now pretend to do, it will certainly be the publication of this work in French, being the most systematic, the most concise, and, in my opinion, the most perfect, which has hitherto been written in any language.

"In the course of this work, which is already well advanced, I have perceived more than once, that I should require information respecting some particulars. If you would have the extreme kindness to permit me to apply to you to obtain such information, it would be a motive for gratitude which I would well know how to

From the last Pamphlet published by the Essex Agricultural Society.

JOHN LEES' STATEMENT.

Newbury, Nov. 19, 1822.

To the Committee on Indian Corn and other crops.

GENTLEMEN—In the summer of 1821 my fields, generally known by the name of "Boynton Field," which had been for eight or ten years adapted to mowing, not exhibiting so good an appearance as usual in grass, I thought of making up the deficiency by raising a crop of potatoes; consequently, in the latter part of June, I mowed about three quarters of an acre, the produce of which, as near as we could judge by appearances, was a ton of hay of an excellent quality. I then broke up the land and planted the common white potatoes, putting a small shovel full of compost manure into each of the hills. The manner of ploughing, planting, hoeing, &c. was much the same as practised by the farmers in this vicinity; and in autumn the crop of potatoes was rising two hundred bushels.—This success induced me to try what I could do with Indian corn; and late in autumn I carted on thirteen cart loads of compost manure, which lay in small heaps until the following spring, when more of the field was broken up, and this manure spread over the land and ploughed in; then ploughed again and harrowed. The hills were made three and a half feet one way and three feet the other distant from each other, then a shovel full of manure, partly compost and part from the hog yard, was placed in each hill, and five kernels of the common eight rowed corn dropped in each hill. At the time of the first hoeing it was discovered that a red headed worm, measuring from a half inch to one and a half inches in length, was committing sad depredations; it was the opinion of many respectable men, that nearly one half was destroyed. This was replanted, but still the worms continued the destruction; and the season being far advanced, the defective hills were planted again with pumpkins, squashes, turnips, &c.—The piece was hoed three different times, and at the second time the plough was used to facilitate the hoeing; and in autumn I harvested from one acre, measured and staked out by Mr. John Norbener, one hundred and eight bushels and twenty quarts of corn, weighing fifty-nine pounds to the bushel; seventeen hundred and fifty pounds of pumpkins, one hundred and fifty pounds of squashes, and eighteen bushels of turnips. As to the precise times of ploughing, hoeing, planting, &c. I cannot ascertain, in consequence of my principal workman being deprived of his labor by indisposition, and the multiplicity of my cares made it impossible for me to pay that attention which was necessary; suffice it to say that my mode of management was much the same as that of farmers in general. I am, gentlemen, with much respect, your obedient servant,

JOHN LEES.

HENRY LITTLE'S STATEMENT.

Newbury, Nov. 5, 1822.

To the Committee on Green Crops.

GENTLEMEN—The following is a statement of the cultivation and production of one acre of Indian Corn, raised by the subscriber in Newbury. The soil is a dark clay loam, and in 1821 was planted with beets and carrots, and manured with six cords of manure made by a

brewer in Newburyport, and produced about 400 bushels to the acre. In May, 1822, the land was twice ploughed and planted in hills, three and a half feet apart, with five cords of compost manure put in the holes; four grains of corn were put in each hill on the manure and covered with a hoe; the corn is the eight rowed kind, and weighed, when harvested, 58 pounds to the bushel. The green, or unripe corn, was not measured; it was hoed three times, and late in the season; the few weeds that came up were destroyed. The stalks were topped the middle of September; it was harvested in October, and drawn to the granary and measured, and there were two hundred and thirty-two and a half bushels of ears, and a fraction over. By shelling four bushels of ears, the estimate was, that there was one hundred and sixteen bushels and nine quarts of shelled sound corn.

The expense of cultivating the above acre of corn, calculating labor at four shillings.

Rent of land	\$9 00

Yours, respectfully,

HENRY LITTLE.

N.B. The time of topping the stalks and getting in the bottom or butt stalks, not in the estimate. The value of the stover [the stalks and husks] I think equal to one and a half tons of hay.

JOHN DWINELL'S STATEMENT—ON BEETS.

The following statement of a crop of Beets, with the manner of tilling the land, is submitted with the claim for the society's premium, viz.

The land in 1821 was in good heart and produced a crop of potatoes, and is part of the lot which enabled the present claimant to obtain the second premium last year. A reference to the statement then made, will give the committee a full knowledge of it.

The present year the land was ploughed May 1st and 2d, eight inches deep, with one yoke of oxen, which occupied one day and a half; after which it was harrowed, and fitted for receiving the seed, which occupied one day. The remainder of the time was four days sowing, two days weeding, two days hoeing, and eleven and a half days digging, topping, weighing and housing the crop; in all twenty two days labor.

The quantity of manure was one and a half cords, and the quantity of seed two and a half pounds.

The crop, which was weighed, amounted to 29 tons, 0 hundreds, 1 quarter and 25 lbs.—or 580 hundred, 1 quarter and 25 lbs.

All which is respectfully communicated.

JOHN DWINELL.

Salem, November 11, 1822.

HENRY LITTLE'S STATEMENT—ON TURNIPS.

Newbury, Nov. 5, 1822.

To the Committee on Green Crops.

GENTLEMEN—The following is a statement of the cultivation and production of a lot of English Turnips, raised by the subscriber, in Newbury. The soil is a clay loam, and had been down to grass six or seven years; in 1821 cut about one ton of hay to the acre; the last of June, 1822, it was mowed, and cut about half a ton of hay; the ground was then ploughed and ten cords of compost manure (the principal part of the compost was marsh sod,) spread on and harrowed in, then it was ploughed in shallow ridges, three feet apart, and the seed sowed, with a machine, on the ridges, then a roller was made to pass over the same, and the sowing was finished. It took one pound of seed to the acre; they were thinned to the distance of one foot apart in the row; they were twice ploughed and hoed, and harvested the last of October, and the crop was six hundred and eighty seven and a half bushels.

The expense of cultivating one acre of turnips on the above mode, calculating labor at four shillings per day.

June 28, 29. Ploughing, harrowing, and sowing,	\$6 8
Sowed July 1. Seed and manure,	20 5
Thinning, hoeing, &c.	5 3
Harvesting,	3 3
	<hr/> \$35 8

The quality of the crop. They were large but in consequence of the drought they are fit only for stock.

Yours respectfully,

HENRY LITTLE.

SILAS AND JOSEPH LITTLE'S STATEMENT—ON TURNIPS.

Newbury, Nov. 14, 1822.

To John W. Proctor, Esq. Secretary of the Essex Agricultural Society.

SIR—We have this year cultivated an acre of common turnips on our farm in Newbury, and as we hope to obtain the Society's premium we are bound to make a particular statement of the mode of cultivation.

A small part of this acre was sown with turnips the last year; the other part has been grass ground five or six years. This year that part which was used for turnips we sowed with flax, after putting on it about five loads of manure, and pulled the flax as soon as the blowing had fallen off; then ploughed it, together with the grass ground, so as to make an acre and after harrowing in part, carried on nine teen cartloads of compost manure, mostly sandy loam, to mix with our clay loam. The one part we spread on half the ground, and then ridged it with a small double-mouldboard plough about two feet and nine inches apart. The other part was furrowed with the plough, and the manure put in the furrows at a like distance (the produce however was about equal,) and ridged as above, which covered all the manure. One pound and a half of seed was sown on the acre, one row on a ridge, and after the turnips were out of the way of the flies they were thinned at the distance of 10 or 12 inches, then hoed twice, and ploughed once.

The time of harvesting began the 28th of October, and ended the first of November; and

here were six hundred and fifteen bushels, rimmed fit for the market, besides five or six bushels defective or rotten, and unfit. The weight of a bushel 59 lbs. Expense of cultivation:

Ploughing and harrowing	\$3 00
Manure	13 00
Seed	50
Ridging and sowing	2 00
Thinning	2 75
Hoeing	2 50
Harvesting	5 00

\$28 75

Sir, we are yours, with great respect,
 SILAS LITTLE,
 JOSEPH LITTLE.

NEW ENGLAND FARMER.

SATURDAY, MAY 17, 1823.

The Farmer's and Gardener's Remembrancer.

MAY.

GIVE NO QUARTER TO NOXIOUS INSECTS.—Our climate and soil have, of late years, developed extraordinary propensities to increase and multiply the petty plunderers which tenant every clod, pervade every particle of earth, float in every breeze, make their domiciles in every useful vegetable, and tease, torment and destroy many of our most valuable domestic animals.—We have already (p. 293) recommended some applications for the purpose of checking the ravages of insects. We would now mention another substance, which is valuable as well for manure, as for its property as a preservative against insects. *Soap suds* is highly recommended, by good authority, as very efficacious in both those capacities. Yet, we apprehend that it is commonly thrown away by people who call themselves excellent economists. Many a *tidy body* makes use of soap suds in the manufacture of puddles, generally located near the steps of the front door, which appear very agreeable in consequence of the contrast, thus exhibited, between the nastiness without, and the neatness within doors. When not conveyed by proper pipes, troughs or channels, to some general repository of liquid manure, (according to our directions p. 281) they should be preserved either in pits sunk in the garden and lined with clay, or in tubs, barrels, hogsheds, &c. Or if more convenient, make a large trough from the butt of a pine, or some other suitable tree, and direct your washer woman to save her suds in that recipient. Thus, with a little pains, you get great gains; for a little care, is a great affair, as "Poor Richard" might have said. And when proper times and opportunities occur apply this kind of liquid manure to your fruit-trees, your garden vegetables, &c. and we will pay all the damage which insects do after such application; that is to say, provided, nevertheless, that our informants have not deceived us relative to the good effects of said application; of which, however, we have no apprehension.

The Rev. Mr. Falconer, one of the correspondents of the Bath Agricultural Society, in treating of soap suds as a manure, and an antidote to insects, has the following observations: "This mixture of an oil and an alkali has been more generally known than adopted as a remedy against the insects which infest wall fruit

trees. It will dislodge and destroy the insects which have already formed their nests and bred among the leaves. When used in the early part of the year, it seems to prevent the insects from settling upon them; but whether by rendering the surface of the leaf disagreeable to the animals, and thus repelling them, or by neutralizing the acid they deposit, and thus preventing the leaf from contracting into a necessary form for their reception. I cannot presume to determine. One of the modes by which this mixture indirectly contributes to the fertility of the ground may be by its destruction of the insects which prey upon the plants.

"It is also, I think, to be preferred to lime water,* or the wood ashes and lime which Mr. Forsyth recommends for the destruction of insects. It is preferable to the lime water, and the lime, because lime loses its causticity, and with that its efficacy, by exposure to air, and must consequently be frequently applied; and to the dredging of the leaves with the fine dust of wood ashes and lime, because the same effect is produced by the mixture without the same labor, and is obtained without expense."

The same writer directs to make use of a common garden pump for sprinkling trees with soap suds, and says if the water of a washing cannot be had, a quantity of potash, dissolved in water, may be substituted. He declares that "the washing of the trees twice a week for three or four weeks in the spring will be sufficient to secure them from the injuries of these insects." A long paper on the use of soap suds as a manure is concluded as follows: "On the whole then, this must be considered as a valuable manure, as it can be obtained easily, at small expense, and in large quantities; and when its nature is well understood, will probably be no less esteemed by the farmer than horse dung. To the gardener, as well as to the farmer, it is useful, mixed with mould, as a fertilizing compost; or when fluid may be applied to his fruit trees, as a wash fatal to the noxious brood of predatory insects."

The writer of the article above quoted mentions no particular kinds of insects which may be destroyed by this mixture, but says "it will dislodge and destroy the insects which have already formed their nests and bred among the leaves." Caterpillars and canker worms are said to be very tenacious of life, and probably might not be immediately destroyed by the application here recommended. But pure water alone, if thrown with some force against their habitations, with a forcing pump, would disconcert if not destroy those evil doers.

If soap suds alone are competent to the destruction of these insects, of course other more troublesome and expensive applications may be omitted. Besides, the mixture recommended would be worth applying, were it merely on account of its properties as a manure. It might be well, in order to make assurance doubly sure, to mix with your suds decoctions of elder and tobacco. We are of opinion that a little tar or turpentine thrown in with the above ingredients would make the compound more efficacious.

Mr. Yates, of Albany, recommends the following prescription for "doctoring off" caterpillars. "Take a handful of worm wood, one of

* Some gardeners recommend the use of lime water, but it is not commonly employed, being found hurtful to the foliage.—*Agricultural Report of Scotland.*

roe, and two of Virginia tobacco; (a sufficient quantity of tobacco alone will do, but not so well,) boil these together in about two pails full of rain water for nearly half an hour, strain it through a cloth, and with this liquor sprinkle the trees. He performs this with a barrow engine; but the operation should be performed when the caterpillars or worms have left their nocturnal nest or web, and are dispersed on the trees. Repeat the operation two or three times, and they will drop down and expire."*

When caterpillars or worms are in their nests (which is generally the case in cool, rainy or cloudy weather, or early in the morning after a cool night,) we are told that spirits of turpentine, or common fish oil, applied by a sponge attached to the end of a pole, will kill every caterpillar within the sphere of its influence. But as we said before, if soap suds will answer according to the recommendations, we do not perceive the necessity for ransacking the whole store-house of nature for other and more expensive remedies. We should think it advisable to strain or decant any liquid substance which shall be applied to the leaves of trees or other vegetables, for a glutinous or muddy substance might close the pores or impede the perspiration of the leaves, which are the lungs of plants.

WORMS WHICH ATTACK THE ROOTS AND TRUNKS OF FRUIT TREES AND OTHER TREES.—John Prince Esq. of Roxbury, published a communication relative to these insects in the Mass. Agricultural Repository, vol. iv. From this it appears that Mr. Prince had lost many apple trees by means of "a small, white, ringed worm, about three quarters of an inch long, with a dark colored head, (I believe the same which attacks the peach tree,) attacking them at and just below the surface of the ground. The remedy is the same pointed out in an article, published p. 317, 3d col. of our paper. The following is likewise recommended in the Mass. Agricultural Repository: "Take equal parts of quick lime, cow dung and clay, which by the addition of soap suds and urine, should be reduced to the consistence of common paste. To make it more adhesive add a little hair. Let the whole stem, from the roots to the branches, be enveloped with a coating of this composition, and occasionally, repeated, and it will scarcely be possible for the fly or worm or insects to injure the trunk of the tree; and it will at the same time prove conducive to its health and vigor. It might even be recommended to make the application to all young trees, at the time of transplanting, especially in places where the worm is known to prevail."

LICE INFESTING YOUNG ORCHARDS.—The following is a communication on this subject, which, we believe, was first published in the Mass. Agricultural Repository, vol. iii, p. 144. Tho' it has been frequently republished it may be new to some, and serve as a *remembrancer* to others of our readers.

"This insect, called *lice*, is in form like half a kernel of rye, (but not more than one twentieth part so large) with the flat side sticking to the smooth part of the tree. They resemble blisters; and are near the color of the bark of the tree. These blisters contain from ten to thirty nits or eggs each, in form like a snake's egg; which, in a common season, begin to

* Thatcher's Orchardist, p. 97

hatch about the 25th of May, and finish about the 10th of June. These nits produce white animalculæ, resembling a louse, so small they are hardly perceptible by the naked eye, which immediately after they are hatched, open the passage at the end of the blister, and crawl out on the bark of the tree; and there remain with but little motion, about ten days; when they stick themselves fast to the bark of the tree and die. From this little carcass arises a small speck of *blue mould*, which is most plain to be seen between the 10th and 20th of June, and continues about fifteen days, and then gradually wears off, until the old carcass appears, which, by this time is formed into a new blister, and contains the spawns or nits before mentioned.

These blisters prevent the circulation of sap, and prove as fatal to the tree as the canker worm.

"In order to remedy the difficulty, I have made many experiments within a few years; but long to no good effect, not knowing then the particular season when these animalculæ could be most easily destroyed. This, however, I have lately found to be between the time they hatch, and that when the mould leaves them.* The application that I have found most effectual is, washing the trees with lye or brine. Lime, also, mixed with lye, to the consistence of white wash, may be useful. And although the small branches cannot be cleansed in this manner without much difficulty, still, if the body of the tree, and the branches near the body are kept clean until there comes a rough bark, I think the lice will not kill the tree.

"Some people have recommended the application of *train oil* to the tree, which, indeed, is a powerful antidote against lice, but being of a glutinous quality, is very detrimental to the tree. *Inoculation* has been proposed; which, I think, will have no effect at all on the lice; for I perceive they hatch in May, on branches that were pruned off the tree in March, and the sap entirely extinguished.

"These lice are natural in the *uncultivated* forest, on what is called moose-wood, and other bushes.

"Much care should be taken on their first appearing in an orchard or nursery; as the cutting down and destroying a few young trees is of no importance, compared with the difficulty of having an orchard overrun with them.

"P. S. The brine or pickle with which the tree is to be washed, should not be such as has had meat salted in it; but let one quart of common salt be dissolved in two gallons of clean water."

INDIAN CORN.—It is time to begin to think about planting this valuable grain. It is not best, however, to commit your seed to the ground till it has been pretty well warmed and dried by the advance of spring, which, this year, is unusually backward. The old Indian rule with regard to the time of planting, is to plant when the leaves of the white oak tree are about the size of a mouse's ear. This, we believe, generally takes place, in New England, between the 20th of May and the first of June.

"If twenty loads of good manure can be afforded to an acre, it should be spread on the

land and ploughed in; if no more than half that quantity, it will be best to put in holes. In the former case the corn usually comes up better, suffers less by drought and worms, and the land is left in better order after the crop. In the latter case the plants are more assisted in their growth in proportion to the quantity of manure. If the manure be new dung, burying it under the furrows is by far the better method. None but old dung should be put in the holes."—Probably the best way is to spread a quantity of green or fresh manure over the ground as evenly as possible, and put your well rotted or compost manure into the hills. In this way the rotted manure will supply nourishment to the plants the first part of the season, and the fresh manure, which was spread over the whole surface, will assist the plants most materially about the time the ears are filling. Col. Valentine, in raising his premium crop (see page 178,) spread his green barn yard manure over the whole land, and likewise put another quantity "of barn, hog, and slaughter yard manure" in the rows. In this way he raised 116 bushels and 23 quarts of sound corn to the acre.

If your land is rough or stony, and your object is to make the most of your labor, your better way will be to plant your corn in hills; but if the soil be rich and easy to till, and you wish to make the most of your land, you will of course choose the drill method; or, perhaps, if your object is to surpass every body, and get a premium into the bargain, you may as well take a hint from the following paragraph, extracted from an essay of Mr. Black, published in the *American Farmer*, vol. ii, p. 27.

"I risque it as an opinion, confessedly without any actual experiment to support it, that as a matter of curiosity it might be possible to make some fraction of an acre of ground so deep and perfect in its soil as to produce, and maintain to maturity, one stock of Indian corn upon every twenty-four inches of square surface. If so, and we allow one good ear to each stalk, and half a pint of grain to each ear, the product would be about at the rate of one hundred and sixty-eight bushels to the acre."

It appears that this conjecture has been more than realized. Messrs. J. & M. Pratt, of Easton, Madison county, N. Y. raised the last season, on one acre, *one hundred and seventy-two bushels and one fourth*; and on three acres, four hundred and ninety-four bushels and one fourth. We have seen no statement of the particular mode of cultivation adopted by the Messrs. Pratt's; but can have no doubt that in order to obtain the greatest possible crop of Indian corn, (as well as any other vegetable) it will be necessary that every plant should stand by itself—that all the plants should be equi-distant from each other, and perhaps two feet each way would, in that mode of planting, be the distance required for the purpose stated. In that manner of planting, however, the cultivator must forego the advantage of using the plough to lessen the labor of hoeing, and probably for field cultivation the common modes of planting in drills, or in hills, will be most expedient.

* Deane's New England Farmer.

† See page 117 of this paper.

Coal discovered.—A bed of coal of superior quality has been discovered on the farm of Mr. Teal, situated at Kinderhook, on the Hudson river.

ON MIXING LIME WITH MANURE.

Our paper No. 39, page 306, contains a communication from a correspondent, dated Livermore, Maine, in which is the following query: "Would it not confer a favor on your patrons, if some one who is acquainted with the use and operation of lime, would communicate through the medium of your paper, the manner and the quantity [of lime] which should be mixed with a load of green manure, and also how long after the mixture before the straw and stubble will be decomposed and fit for use?"

As none of our correspondents have obliged us with an answer to this question we will state what we learn from books relating to this subject, promising that we have no knowledge of it derived from personal experience.

In a paper first published in the *Memoirs of the Philadelphia Agricultural Society*, entitled "Notices for a Young Farmer," which is ascribed to the Hon. Judge Peters, of Pennsylvania, (than whom no one stands higher on the roll of American agriculturists) we have the following directions and assertions:

"Mix earth with your fermenting litter or muck rather than lime, until the fermentation be sufficiently advanced." "Plaster, in compost in which vegetable matter is mixed, is more beneficial than lime." Again he says, "Mix no hot lime with your muck, dung, or compost heap before fermentation has ceased, or sufficiently advanced, as it injures moderate fermentation, and often consumes the muck. Instances of even conflagration of strawy muck, by hot lime, to a great extent, can be given. If lime be used, that which is slacked is sweet and best, when mixed with either dung or compost."

The same opinions are expressed by other authors. The writer of the article "Compost," in Rees's Cyclopaedia, directs, in making composts, to interpose a layer of earth between every layer of dung and of lime. We should think that in all cases where the manure is combustible, quick lime would injure if not destroy it, and we do not see why a cultivator may not as well burn a straw or muck heap with hot coals as with hot lime.

We will here subjoin one other quotation from the work of Judge Peters, above quoted, which, though it does not directly apply to the question stated by our correspondent, may be of use.

"Nothing requires more attention to the nature and qualities of your soil than the use of lime. If it be too lavishly applied, or too frequently repeated without intervals of grass to furnish vegetable matter; or manures, either animal or vegetable, ploughed in for the lime (according to the country phraseology) to feed on, it renders your ground *lime sick*, and reduces it to sterility. Our caustic lime must be applied in quantities very far less than the *mild lime* of Europe, if we would avoid turning a highly beneficial auxiliary into a destructive scourge. No certain rules, as to quantity per acre, can be fixed, without a perfect knowledge of the soil to which it is to be applied. In all cases, moderate quantities, at first, are the safest. Our common lime is here meant; as much depends on the kind of lime applied. It must therefore be the study of those who apply lime, to discover its composition, or what is called its strength, before they can form a correct opinion of its salutary or injurious uses. It would seem, that the *mild lime* had some fertilizing qualities in itself, otherwise the lavish use of it, whereof we read, cannot be accounted for. The lime of burnt oyster shells, is *mild*; and land of any tolerable staple will bear great quantities beyond the proper allowance, to the acre of caustic lime. Many other instances might be adduced. Both large and small quantities operate

t once. But it is fugacious; and compared with austic lime, soon exhausted. Of the mild lime of England, seven hundred bushels have been put on an acre; and two hundred bushels are common. What the strength of their mild lime compared with oyster shell lime, or with our magnesian or caustic lime, is unknown. Forty to sixty bushels of the latter, are amply sufficient, with us, for any worn acre; and for most part of our worn land, too much, at the first dressing. What quantity of oyster shell lime is proper at first, is not yet ascertained. Repetitions of smaller quantities, at intervals, would be better than applications of too much at once."

FALL FEVERS.

A correspondent of the Franklin Gazette makes the following remarks:

"Some time since, when the fall fever raged violently in the neighborhood of a canal, then in a state of progress, numbers of the workmen engaged on it cat plentifully of garlic, and wholly escaped, while those who abstained from the use of this article were severely afflicted by the disorder. That this may have been accidental I freely admit; but garlic may, nevertheless, be a specific against autumnal fevers. If so, it is an invaluable article in the Materia Medica. Persons in the neighborhood of canals and stagnant waters generally, are advised to make trial of this article, in the course of the succeeding fall, and communicate the result."

FOREIGN.

LATEST FROM EUROPE.

The ship *Thomas Fowler* arrived at this port on the 3th inst. bringing London papers to the 5th of April, and these containing Madrid dates to the 19th March. One body of the Spanish insurgents with their leader, had surrendered to Gen. Ballasteros, who granted them an entire pardon. Two superior officers from Aqueniza have also made proposals to the Constitutional general for a capitulation. Mina continues to organize his army, which is devoted to him. The French army was not expected to move at present. It is said they have no means of conveyance, and that they will find none after entering Spain. An article, dated Stock Exchange, London, April 5, states, that "The well informed positively assert that the invasion of Spain is deferred to the 16th." Some of the papers, however, declare that the war will soon be prosecuted with great vigor.

Constantinople.—The Janizaries are in a state of great fermentation, and the numerous Musselmén, who parade the street in arms, commit great excesses.—They broke into Christian houses, and murdered several persons, among whom were two Frenchmen and a German. It is reported that peace will probably be continued between the Russians and the Turks, and that the latter were making great preparations to repossess themselves of the Morea.

Capture of the Pirate Schooner Zaragocana.—Kingston (Jam.) papers of the 13th ult. contain an official account of the capture of that vessel, by the boats of the British, in which the marauders had 10 killed, and 15 wounded; 16 were taken by the Spaniards on shore, and 23 carried into Port Royal for trial.

Three days later.—By an arrival at New York, London dates have been received to the 8th April. There has been a report published in the London Sun that the French declaration of war had been received by the English government. This, however, turns out to be a mere stock-jobbing hoax. The French are still delaying their threatened attack on Spain, and expectation, who has so long stood on tip-toe, may as well set her feet down, and leave off gaping after bloody news, which, it is hoped, she never may have occasion to swallow. A corps of the *Army of Faith*, after having been clothed and armed by the French, have added good works to their creed, by joining their brethren, the Spanish Patriots. The *Duchess of Angoulême* has left Paris for Bordeaux, it should seem to take an active part in the crusade. Whether this noble Amazon is to display the Banners of Beauty in front or rear of the

French army, rumor does not say. Perhaps she will present some of the ensigns in the French service with appropriate colors, a speech, &c. after the manner of our American ladies. And, possibly, his Majesty of Spain has promised to requite the favor with an "*unbrodered petticoat*" of his own manufacture. On the whole, the French councils appear to be as feeble and vacillating as their cause is unjust, and the terrible is giving place to the ridiculous in all their late movements.

DOMESTIC.

The Governor and Council have examined the returns of votes for Senators from the several Districts, and it appears that 33 are elected—22 democrats, and 16 federalists. There is one vacancy in Essex and one in Bristol.

The election of Representatives to the General Assembly took place in this city last Monday. Twenty-four federalists were elected by an average majority of about one hundred votes; and there is one vacancy. It is expected there will be a democratic majority in the House of about fifty.

Peter O. Thacher, Esq. has been appointed by the Governor and Council, Judge of the Municipal Court for this city, vice Judge Quincy resigned.

On Wednesday night last, Louis Debois, a Frenchman, of genteel appearance, about 40 or 45 years old, was apprehended in the office of Mr. Samuel Dana, while in the act of attempting to open the money vault with false keys. Mr. Dana, suspecting that attempts had before been made to open his vault, procured two constables to watch for the night in his office. About 11 o'clock the rogue came, unlocked the outer door, and was inserting his key in the lock of the vault, when he was seized by the constables and secured.—He had about him a number of keys of curious construction, suited to open a variety of locks.

Dreadful Accident.—On the 9th inst. at New York, the boiler of the Steam-boat Patent burst, and scalded six men. The accident cannot be accounted for, as the boiler had borne more steam than it appeared to have at that time, and the presumption is that there was some stoppage in the steam gauge. Three of the men were so badly scalded that it is feared they will not survive. [Five of the unfortunate men who were scalded have since died, including Mr. Dodd, of New Jersey, the Engineer.]

Agriculture encouraged in Nova Scotia.—The Legislature of Nova Scotia has granted \$4000 the present year for the encouragement of agriculture. A handsome sum for a province whose revenue and resources are small. It has also granted \$600 to a Steam Boat Company.—*N. H. Patriot.*

An Ox was lately exhibited at Baltimore, which is stated to have weighed nearly 4000 lbs.

Large Hogs.—Some of the most extraordinary swine that have ever been raised, have been exhibited at Mr. Graves' Cattle Yard in Sixth, opposite Noble St. It is supposed that one of them, when killed and dressed, will weigh 1000 lbs. Its age is only twenty-two months. Another supposed to weigh, in like manner, 700 lbs. and a pig of five months, between 200 and 300 lbs. are also presented to public curiosity.—*Phil. pap.*

Mammoth Bean.—We saw yesterday a dried *Bean Pod*, (full of large beans,) which measured thirteen inches in length and four in circumference. It is in the shape of a Turkish sabre, of a yellowish hue, and beautifully seamed on both sides. This singular vegetable grew in Florida, and was sent to a gentleman in this town, who will endeavor to propagate it.

Providence paper.

A suit has been commenced against the Corporation of Washington for the highest prize drawn in the fifth Class of the Grand National Lottery.

The libel suit, Mathews vs. Buckingham, which has been so much talked about, we understand has been dropped by the Plaintiff.

Sale of Eastern Lands.—Seventeen townships of land, situated in Maine, on the Penobscot river, being a part of the land assigned to this State in a late partition with the State of Maine, were sold at auction on Thursday, from 5-12 to 20 cts. per acre. 331,035 acres were sold, amounting to \$22,000. A further sale will take place some time next summer or autumn.

Fire at Natchitoches.—Intelligence received at New Orleans states that a fire broke out in the Catholic church at Natchitoches on the 30th of March, which destroyed that edifice with about 40 dwelling houses and stores in the most commercial part of the town.

A Yankee Trick.—The American schooner *Cutler*, from Bath, Maine, in order to avoid the duties imposed by the British Navigation Law, on *live stock*, has arrived at Barbadoes with a cargo of *dead meat*, consisting of quarters of beef, mutton, &c. packed in ice.

TREE BRUSHES.

FOR SALE, at the Agricultural Establishment, No. 20, Merchants' Row, opposite the east end of the Old Market, a few of those highly and much approved TREE BRUSHES, for destroying Caterpillars, and which have been so highly recommended by the Hon. Timothy Pickens, in his communication to the Essex Agricultural Society. May 10.

ART OF PRUNING WALL TREES.

Behold new grafted trees in spring,
Ere the first Cuckoo tries to sing;
But leave four swelling buds to grow
With wide diverging arms below;
Or fix one central trunk erect,
And on each side its boughs deflect.

In summer hours from fertile stems
Rub off the supernumerous gems;
But where unfruitful branches rise
In proud luxuriance to the skies,
Expect the exuberant growth, or bind
A wiry ringlet round the rind;
Or seize with shreds the leafy birth,
And bind it parallel to earth.

When from their winter lodge escape
The swelling fig, or clustering grape,
Pinch off the summit-shoots that rise
Two joints above the fertile eyes;
But when with branches wide and tall
The vine shall crowd your trellis'd wall,
Or when from strong external roots,
Each rafter owns three vigorous shoots,
Watch, and as grows the ascending wood,
Lop at two joints each lateral bud.
So shall each eye a cluster bear,
To charm the next succeeding year;
And as the spiral tendrils cling,
Deck with festoons the brow of spring.

Where crowded growths less space allow,
Close lop them from the parent bough;
But when they rise too weak or few,
Prune out old wood, and train in new.
So, as each tree your wall receives,
Fair fruits shall blush amid the leaves.

Menage has this acute observation on the writings of love and religion:—"Books of devotion and those of love are alike bought. The only difference I find is, that there are more who read books of love, than buy them; and there are more who buy books of devotion, than read them."

There are many things in this world which can be learned only by experience, and therefore the most brilliant and acute genius in most cases ought to pay some attention to an old man who has learned wisdom by age and experience.

There are two things which ought to make us think but meanly of human glory; the very best have had their calumniators; the very worst their panegyrists.

From Las Cases' Journal.

The Emperor Napoleon shaves in the recess of the window nearest the fire-place. His first valet-de-chambre hands him the soap and razor, and the second holds before him the looking-glass of his dressing case, so that the Emperor may present to the light the side that he is shaving. It is the business of the second valet-de-chambre to tell him whether he shaves clean. Having shaved one side, he turns completely round to shave the other, and the valets change sides. The Emperor then washes his face.—After he has finished shaving each side of his beard, he sometimes good humoredly looks his valet in the face for a few seconds, and then gives him a smart box on the ear.

From the Portland Gazette.

MR. SHIRLEY.—While taking a journey some time last winter through the country, I stopped at a village where, for the want of a tavern, I was obliged to call at a store to procure refreshment for my horse. Among the numerous notices and advertisements that decorated the fire place, as is usual in such cases, I noticed one of a singular character, and which, as soon as I stopped for the night at my next stage, I endeavored to note down, as nearly to the original as my recollection served me. If you think it worthy of notice in your paper, please to give it a place.

A SUBSCRIBER.

THE WET TAX.

A true statement of Mr. Ichabod Booz's wet tax for the year 1822, viz:

One day spent each week at the store,
equal to 52 days, which at 4s per day
amounts to \$31 67

Parts of other days spent at the stores
every week, besides the above, say in
all 20 days, at 4s 13 33

One gill new rum drank on each of those
days, say 90 gills in all, at 4 cents, is 3 60

The same quantity bought to treat his
brother, Obadiah Booz, and other
good friends by way of reciprocal ci- 3 60

Twenty-five glasses of brandy, bought
occasionally, to stimulate the system,
give an appetite, and brighten the
spirits, at 8 cents 2 00

Thirty glasses of gin and molasses, to
counteract the evil effects of the bran- 1 80

Losses sustained by reason of his being
absent from home, viz:

Damage to three tons of hay by rain, it
not being got in season—good hay half
spoiled, 3 tons, at 4 dolls. 12 00

Damage to the corn by brother Obadiah's
cattle, that broke in while the boys
were gone a fishing—about 20 bushels
lost 10 00

Loss on a yoke of steers which he was
obliged to sacrifice to get money to
pay his other taxes, worth \$40, sold
for \$30, 10 00

Bill of cost paid on a suit by Capt. T. the
trader, for his rum score for 1821 5 68

Total amount of Mr. B.'s wet tax, for
1822 \$96 68

An equal stake.—A delegate in Congress offered to stake his reputation against a cent on the propriety of a certain measure which he had himself proposed. A gentleman in opposition pronounced it the most equal bet he had ever heard of.

High Living.—A certain physician, whenever he visited his wealthy patients, always went into the kitchen, to make his compliments to the cooks, saying, "My good friends, I owe you a thousand thanks for all the good services which you render us physicians; without your art of poisoning, the faculty would all be soon in the poor house."

A gentleman being asked to make a pun, requested to know on what subject. "The candle," said a lady present. "What, madam, said he, do you wish to make light of my puns?"

AGRICULTURAL ESTABLISHMENT,
NO. 20, MERCHANTS' ROW,

(At the East End of the Old Market.)

FOR sale as above, a variety of the most approved single and double mould board Ploughs, C. Howard's improved cast iron mould board, with wrought Shear and Coulters, Cast iron do. do. do. J. Seaver & Co's. do. do. Bigelow's wrought do. do. Warren's much approved common Ploughs, Sinclair's side hill do. do. Howard's much improved Cultivator, an implement highly esteemed for its use and utility in drill cultivation,

Beatson's Scarifier, Bennet's Broad Cast, Seed Sowing Machines, calculated for large and small seed,

Eastman's improved Straw Cutter, Safford's new invented Straw Cutter, much improved Common hand Straw Cutters, An English Vegetable Cutter, Stevens' patent steel spring Hay and Manure Forks, Steel spring Potatoe Hoes, English cast steel broad Hoes, Common and steel do. do.

A great variety of Garden and other Agricultural Implements.

Tree Brushes, for destroying Caterpillars, an article highly recommended for that purpose, by the Hon. Timothy Pickering, whose communication on this subject appeared in the New England Farmer, April 26, page 303.

May 3.

AGRICULTURAL & HORTICULTURAL SEEDS

JOSEPH BRIDGE, No. 25, Court Street, has just received, per London Packet, a variety of

GARDEN AND FIELD SEEDS,

which added to his former extensive assortment, make the most complete variety, probably in the U. States. Among them—300 lbs. Carrots, 200 lbs. Beets, 50 lbs. Mangel Wurtzel, 200 lbs. Ruta Baga, 30 bush. Peas, 100 Raddish, of sorts; Lettuce, Cabbage, Cauliflower, Kale, Broccoli, Sweet Marjoram, Thyme, Summer and Winter Savory, Sage, Hyssop, Fennell, Dill, Salsific, Scorzenera, Endive, Red and White Clover, Red Top Fowl Meadow—with an extensive collection of Flower Seeds, Bird Seeds, &c.

GARDEN TOOLS, viz: Pruning and Budding Knives, Pruning Saws, Transplanting Trowels, Garden Reels and Lines, Edging Irons, &c. Flower Pots constantly on hand. May 3.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLAR per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the Publisher) until arrearages are paid.

Complete files from the commencement of the paper in August can be furnished.

Agents who procure seven subscribers, and become responsible for the payment, will be entitled to copy gratis, and in the same proportion for a large number.

NEW ENGLAND FARMER.

PUBLISHED BY THOMAS W. SHEPARD, ROGERS' BUILDINGS, CONGRESS STREET, (FOURTH DOOR FROM STATE STREET.)

VOL. I.

BOSTON, SATURDAY, MAY 24, 1823.

No. 43.

The following "Report, delivered before the Provincial Agricultural Society," in Nova Scotia, will, we trust, be found interesting and useful, as well to the statesman as to the Cultivator. It was obligingly sent us in a pamphlet (of which it composes a part) entitled "An Abstract of the Proceedings which occurred at the two Meetings of the Provincial Agricultural Society, during the session of 1823." The author of the report, JOHN YOUNG, Esq. is Secretary to that Society, and has obtained much, and well merited celebrity, by his writings entitled "*Letters of Agricola*," which we have frequently quoted in the progress of our editorial labours, with those marks of approbation to which they appear to us to be entitled.

REPORT.

DELIVERED BEFORE THE

PROVINCIAL AGRICULTURAL SOCIETY.

It is an observation verified by a long and uniform experience, that all the arts, whether of name or utility, are of slow growth. The inventor generally sketches nothing more than a rude draught which, though bold in the design, is likely to be inelegant in the execution; and his humble race of imitators follow the track pointed out without a single spark of that divine fire which threw the first light on the path of their labours. At times a genius arises, brighter or more fortunate than the rest, who makes some small advances either in facilitating the mode of operation, or in mastering some of the difficulties with which it is beset; and in this way, the art, from trivial beginnings, proceeds by a series of steps to some degree of excellence. But this is all the work of time. The progress throughout its whole length is distinguished by many pauses or intervals: and what begun in one age, continues unfinished and imperfect in the next. It often takes many generations to carry the system to its ulterior pitch of improvement, and to conquer the various impediments which are successively presented. The justness of these views could be shown only by a reference to the history of the element arts, which have at once delighted and benefited mankind, and given grace and stability to social life. But it would be idle to wander so far, when we can arrive at the same illustration by a plainer and more direct road: for the mechanic arts have been as sluggish in their progress as the ornamental; and among these none has taken a longer period in growing up to maturity than that of agriculture. Though it sprang up in the very infancy of civilization, and has been more or less cultivated in every age and country, it is still very far from perfection; and in it there are questions of great moment, both speculative and practical, which have not been, and which perhaps cannot in the present condition of human knowledge, be satisfactorily solved.

Tillage and cultivation have not only had to surmount the obstacles which are common to all the other pursuits of life, but they are encompassed with extraordinary difficulties, and are kept back and checked by some peculiar causes of retardation. Thus, if any remarkable discovery were to take place in architecture, in ship-building, in steam navigation, in road making or

in any of the common manufactures, these in a short time would diffuse themselves over the world, and be adopted by all nations; but very different hitherto has been the reception given to the real improvements which have originated in husbandry. Here prejudices of a most unyielding temper are arrayed against the progress of melioration; and nothing has been found more impracticable than to change or abolish any practices which have once taken root in a country. Husbandmen of all others are tenacious of what has been transmitted by their forefathers. The methods of cropping—the structure of the implements—the species of the cattle—which have come down to them impressed with the seal of antiquity, are regarded with a sort of sacred reverence; and it has always been an extremely hard task to clear the way for any innovation. This adherence to existing forms has rendered the inventions of one country not easily transferable to another, and has caused, in different States, almost as wide a dissimilarity in the systems of agriculture, as in the plans and maxims of government. Hence the Roman plough, which had but one handle and no mould board, and which on these accounts was faulty in the construction, maintained its ground from the origin of the republic till the final extinction of the empire in the middle of the fifteenth century—a period of nearly two thousand two hundred years. And since too the introduction of summer fallow into Scotland was of no earlier date than the reign of Queen Anne, although it had long before existed in the South of Britain, in the Low countries, and in France—places with which the Scots had frequent intercourse, particularly after the accession of James to the English crown.

If agriculture, as has been now represented, be so tardy in its movements—if its prejudices be of so stubborn and immutable a nature—and if its discoveries be so difficult of transmission from one place to another, whence happens it that the brief annals of our agricultural career present appearances so utterly at variance with those which have occurred in other countries? by what friendly agency have we been propelled forward at a rate of progression so prodigiously different from that of other people? and how comes it to pass, that innovation on received opinions and established practices have encountered here so little effectual resistance and trampled on every obstacle? Before answering these questions let me recal in a hasty manner the events of every successive year since the establishment and incorporation of this Society, during which our whole system has undergone in some of its parts a partial, and in others a total revolution.

In the Session of 1819 the first grant of £1,500 was given to the Central Board—a portion of which was laid out in the encouragement of summer fallow, of liming, and in the erection of oat-mills. Although little was effected in these objects during the currency of that year, much attention was drawn to them, and a more than common zeal evinced to follow up the directions of the Society. The minds of men were aroused, as it were, from a fatal lethargy—the eye

of curiosity and research was cast round on every quarter to explore the resources of the country—and some few essays were made in the plans recommended, but with a visible distrust of the doctrines and reasonings on which their efficacy was assumed to rest. The farmers passed the year rather in speculation than in action; and amused themselves, some in defending, others in attacking and vilifying the new order of things. The spring of 1820, when the second grant of £1000 was obtained, opened under better auspices. The trials of the past year, imperfect and scanty as they were, had partially dispelled some of the doubts which shed a malignant influence on exertion; and a faint idea began to be entertained, that Nova Scotia with industry might possibly prove independent in bread-corn. The erection of oat-mills gave some colour to the first dawns of hope; and the new scheme of prizes, by which was meant to be ascertained the quantity of white and green crops procurable from an acre, promised a fair opportunity of contrasting the fertility of our soil with that of other countries. You all know the issue of that comparison, and the elevation it communicated to the public mind. Oatmeal now came rapidly into repute, and obtained in the eastern districts. In the course of eighteen months, thirty one mills for manufacturing it were at once the reward and triumph of your labours; and for these altogether £260 only were offered in the shape of bounties. At the next meeting of the Legislature in 1821, the new system had begun to settle firmly in its foundation, and to present for the first time an air of stability. The theory had been put to the test, and partly grown into practice. The incredulous began to mistrust their former conclusions—the wavering gathered confidence, and waxed more and more confirmed. Manures, throughout the whole province, were collected with greater care, and every source was examined from which materials could be drawn to augment their quantity. The method of tilling was now perceptibly improved—the drilling of green crops was now coming into fashion—new implements were fabricated in several places, arable cultivation was obviously on the increase, and silently encroaching on the grazing husbandry. In the autumn of that year the effects of this fresh and growing energy became apparent in the superabundance of all sorts of vegetables and roots. Potatoes and turnips were poured into the capital in so full a tide as completely to inundate us; and these first fruits of plenty derived from our own territory were gladly hailed as a sure presage of that fullness in bread-corn which would attend the future labours of the plough. Under these circumstances the last grant of £800 was voted—a sum which has been found totally inadequate to forward the objects deemed more essentially connected with the present stage of our progress.

After this succinct account, the various steps of which are within your remembrance, it will be the business of this report to trace what may be considered as the causes of this rapid and singular change in Nova Scotia, and to mark such new occurrences of favourable omen as

have more recently developed themselves, and give reason to believe that we are approaching still nearer the goal to which our efforts have been directed. The causes that have led to the change are chiefly three:—The peculiar organization of our Board of Agriculture—The honourable zeal of our leading characters in all parts of the province,—and the mixed nature of our population drawn from distinct countries, and consequently divided amongst themselves in their maxims, rules and methods of cultivation.

All along since the revival of the provincial industry, the Central Board has been the sole organ by which the legislature has acted. To it the power of direction has been transferred, and through it the grants of public money have been distributed. It has been regarded as the fountain from which the liberality of government has flowed; and on that account it has gained and preserved a preponderating influence over the minor societies. This derived and delegated superiority which it possesses in consequence of its peculiar organization, has enabled it to wield an undisputed authority and to bind in one common plan of operation the jarring energies which would otherwise have disturbed and thwarted each other. Hence to one grand point has the attention of the country been directed year after year, and the joint labours of all have been infinitely more effective than they could have been, if irregular and divergent. The Board prescribed both the objects and rules of competition, and maintained consistency in the general efforts of the agricultural body. Had the separate societies been left free of choice in their particular schemes, these would have been of an incoherent and motley character, and could not likely have been made to harmonize into a common system. One would have directed their premiums solely to the improvement of live stock—a second would have abetted greatly the domestic manufactures—a third would have thrown out line and summer fallow as useless—a fourth would have considered oats as furnishing too coarse a meal for the delicate palate of their members—the drill machinery would have been despised by a fifth; and thus each following their own counsels and partial views would have chalked out a line of conduct that baffled and traversed that of the rest. All these evils have been prevented by the peculiar constitution of the Central Board. The Directors from the outset fixed their eye on independence in bread corn, as the main point in which all their measures should concentrate; and without any material aberration have proceeded towards it with an unwearied ardour of pursuit. Objects of minor importance were either neglected or thrown into the background, and this uniformity of plan has been the chief means of effecting so thorough a change in the provincial husbandry.

And this end has been also brought about by the authority and patronage of the leading men throughout the province. It is not my intention to pass an eulogy on their public spirit—a strain in which posterity much more than the present generation, will take delight in indulging; but it is worthy of notice, that wherever these men have shown themselves most zealous, there the societies were first founded, and their effects became most visible. Hence all the counties have not partaken equally of the bene-

fits of that new excitement, which wherever felt, passed like electric matter and was accompanied with sensations almost as quick and marvellous. In some the precepts of the new school were warmly received—in others they were listened to with indifference; and yet, it cannot be said that in any did they meet with a firm and inflexible resistance. This is nothing more than what might have been expected. No sentiment however popular, has ever inspired a whole people with the same degree of fervency; though if its foundation be in reason, and no violent opposition obstruct its progress, it will in the end work its way by a silent and imperceptible tendency. There are at present manifest and pleasing indications, that the more improved methods of managing land as well as the manufacture of oats are creeping westward; and it is more than probable that they will, before the lapse of two, or at most three years, insinuate themselves into every corner and cranny of the province.

But the third and main cause of the universality of that change which has taken place, lies in the mixed nature of our population. In old communities where society has gotten time to settle down into fixed habits, manners and customs, and into which there is little or no migration of strangers to disturb the accustomed course, all things soon come to wear one unvarying aspect. The style of living—the mode of dress—the religious opinions and the agricultural practices partake of a common character; and by such marks nations are usually distinguished. Nay further, so powerful is the principle of imitation when it has long time to act, that even in the same kingdom, men, occupying one particular district or county, are assimilated into a closer resemblance than are those who live beyond the verge of their immediate communion. Hence the method of cultivation in every separate county of England has some striking characteristics either in the plan of rotation—in the structure of the implements, or in the manner of harvesting; and thus in every district there is somewhat of relief to break the flat uniformity of the national agriculture. It is easy to see how a colony like this, composed of the original French, the Dutch and the Germans—the American refugees—the English, Irish and Scotch, and all these mostly brought together within the last seventy years, could not yet have reared up and cherished with much partiality any common system of husbandry. Every emigrant brought along with him the prepossessions of his native hill and valley; and the only feature in which this heterogeneous mass seems to have agreed, was a decided preference to grazing, above arable cultivation. In this state the Central Board at its establishment found the agricultural body. It was loose and disjointed; with much to amend, but with no antipathy at a stricter coalescence.

These may be justly specified as the favorable causes which have contributed to our success, and which deserve to be recorded and set in this conspicuous light, in order to inspire a just confidence in the measures which have been prosecuted, and to guard against any sudden or fitful deviation from them. The organization of the society by which it has been rendered the medium of all legislative aid to the farmer, and the honorable zeal of our public men from the noble founder of this Institution and his suc-

cessor in office down to the lowest gradation of rank, all co-operating heartily in one plan, have accomplished here a greater revolution in the space of four years, than the Board of Agriculture or the Highland Society, with their powerful means and influence, have been able to achieve in the English or in the Scottish practices. (Remainder next week.)

FOR THE NEW ENGLAND FARMER.

In the early part of the month of June, 1822 I planted a small piece of deep, rich and rather stiff soil in my garden with Mangel Wurtzel seed, or root of Scarcity. The ground had been dug or forked up well a few days before. The day of sowing I raked the ground over smooth and divided it into beds or strips as nearly two feet and three fourths wide as practicable, and hoed and cast them up into ridges four or five inches high, and raked and rounded over the same smooth. Upon each of these ridges I drew two equidistant furrows, about an inch and an half deep, with two pegs about five inches long set in a rake head ten inches apart. In each of these furrows I made a row of holes about two inches deep and five or six apart with a stick about the bigness of my finger, and dropped a single beet or bunch of seed into each hole, and just filled the holes by brushing along the surface with the hand or head of the rake.

The usual culture of culinary plants was pursued through the season. Some care was taken to have one healthy plant only in the proper place, by pulling up where they were too thick and transplanting in places where there were none. It must be observed that all that were transplanted were inferior to the others.

On the 23th October I measured with Gunter's chain the plot of ground where the Mangel Wurtzels were growing, containing six ridges of double rows as above, and found it to be in length forty-five links, in breadth twenty one, including a margin of four inches, comprising, consequently, an area or superficies of 94 square links, or $1\frac{1}{2}$ square rod and $7\frac{1}{2}$ square links, or $1\frac{1}{2}$ square rod and 3,267 square feet. I pulled them, cut off the tops, counted, measured and weighed them, and the result was 56 in number, measuring 20 bushels, and weighing 924 pounds, the average weight being nearly 1 lb. 10 oz. exclusive of the small ones given with the tops to the cows.

It will be seen by the above, that an acre of land, at the same rate, may yield of this excellent vegetable, in one season, with trifling labor, 60,160 of the average weight of 1 lb. 10 oz measuring 2133 $\frac{1}{2}$ bushels, and weighing forty four tons nearly, the estimate being made with out reference to the fraction of 3,267 square feet.

J. PRESCOTT.

Groton, May, 1823.

The following communication is from a person who is a stranger to us, but comes recommended by some of our subscribers, who are "desirous that it should be made public." We have always been somewhat incredulous as respects the doctrine of the moon's influence on vegetation, and have hitherto thought that plant never intermeddled with a farmer's concerns, any farther than now and then to overlook his fields as a quiet spectator. Men of science, have, generally, in modern times, denied the moon any other agency in subliminary matters than what is displayed in

the flowing and ebbing of tides in the ocean, and the atmosphere. The philosophers of antiquity, however, held very different opinions on this subject. To give a sketch of those opinions would be to fill a large volume. We shall merely quote a short article on the subject from Rees' Cyclopaedia under the head *Timber*. The ancients had a great regard to the age of the moon in the felling of their timber. If their rules avail ought they are these: Fell timber in the wane, or four days after the new moon; some say let it be the last quarter. Pliny orders it to be in the very article of the change, which happening on the last day of the winter solstice, the timber he says will be immortal: Columella says from the 20th to the 28th day: Cato four days after the full: Vegetius from the 15th to the 5th, for ship timber; but never in the increase, trees then most abounding with moisture, the only source of putrefaction."

Some modern scientific and practical men have likewise expressed opinions in favor of attending to the state of the moon in cutting timber. The Farmer's Assistant, p. 382, says, "We are assured from an experienced builder of some of the first rate bridges in the northern part of this country, that such timber as is to be exposed to the water, or to frequent wetness, should be felled during the increase of the moon; and that such as is to be kept dry, should be felled during the decrease of that planet."

Dr. Deane, Col. Pickering, and we believe nearly all scientific agriculturists of modern times, have denied the agency of the moon in this and many other matters relating to rural economy, in which certain effects are said to be produced by a certain occult influence of that planet. We have always been of the *anti-lunar* party, and have thought that the man who was watching the motions of the moon in order to ascertain the proper periods for performing the important operations of agriculture, might rank with the person designated by the inspired penman, who says, "He that observeth the wind shall not sow, and he that regardeth the clouds shall not reap." Still we think it improper that any preconceived theories or great authorities should induce us to turn a deaf ear or a blind eye to matters of fact. If we should refuse to believe all which we cannot comprehend, we must deny the powers of magnetism, electricity, gravitation, and many other important and daily occurring manifestations of Almighty agency.

—
FOR THE NEW ENGLAND FARMER.

INSTRUCTIONS FOR FARMERS.

Having lived to the age of seventy years and upwards, and having been the greater part of that time a practical farmer, and by attentive observation having acquired some valuable information with which the great body of farmers are wholly unacquainted, the subscriber is impressed with a belief that the following remarks relative to the raising of Fruit Trees and clearing New Land, may be useful to the rising generation and to posterity.

I was born at Taunton, Bristol county, Mass. in the year 1750. In the spring of the year 1772, I came into the District of Maine, and took up a lot of land at a place then called Sylvester, now Turner, in the County of Oxford, and was one of the five first settlers. I fell five acres of trees, and prepared them for burning; in the autumn following it appeared on examination that a part of them had begun to decay, the sap being considerably rotten, while others in the same piece and of the same kind of wood were perfectly sound. This was a mystery, which at that time I could not ex-

plain or understand. It seemed to be important to ascertain the cause, inasmuch as where trees were sap rotten I had an excellent burn, and where sound it was with great difficulty that the fire could be made to run; and it is from observation and repeated experiments that I am now enabled to explain, to the satisfaction of any rational man, what I once thought to be an inexplicable mystery.

It is a truth that the Moon operates upon this earth and every thing that grows upon it much more powerfully than is generally imagined. It is also true that the effects of her operation vary regularly as she passes through her orbit or monthly course. Timber cut in the wane of the moon will be much more durable than it would be if cut between the new and full moon. Her operations are so great and so different in the various parts of her orbit, that by cutting one tree three hours before the new moon, and another of the same kind six hours afterwards, and preserving them one year, a very striking difference in the soundness of them will be discovered. If I had known as much at the age of twenty-two years as I now do, relative to the subject, I am confident it would have benefitted me more than a thousand dollars, particularly in clearing hard wood land, and in getting durable timber for buildings of all kinds, and for sleds, carts, &c.

When a man is about to clear a piece of land around which he is calculating to make a log fence, he will find it much to his advantage to cut the trees around the piece in the wane of the moon, and if possible during the last quarter, but the remainder should be cut after the change. I have also found by experience, that fruit trees set out in the wane of the moon, and particularly on the last day of the last quarter, are more likely to live and be flourishing than when set out at any other time. Pruning should also be attended to when the moon is in that situation, because the sap is then in such a state of circulation that wounds made at the time will always heal without materially injuring the tree; but trees that are wounded between the new and full moon are liable to bleed, as it were, turn black, and frequently die. I would advise farmers who wish to have flourishing and profitable orchards, to pay particular attention to them in the month of May, annually, a day or two before the new moon. I have proved by experiments, for ten years in succession, that an apple tree limb or graft cut off in the month of May, about three hours before the moon changes, and carefully set out, will grow and do well. On mentioning this circumstance at a certain time to Deacon Chase, he said it made him think of one Hancock, of Martha's Vineyard, who was in the habit, at that season of the year, of going to his nursery and cutting off the small trees within about an inch of the ground, and grafting the stumps, and setting out the tops in other places. In one year from that time the tops took root so as to be in good order for grafting, which he was wont to cut off, graft, and set out as before. I inquired of the deacon whether he was particular in grafting with good fruit, and kept the secret to himself. The deacon thought it strange he should be supposed to be careless as to the kind of fruit with which he grafted, and should be private about it; but I, being a Yankee, guessed he meant to get his living by it.

My mode of grafting is different from that which is generally practised. I do not split the stumps, but take a graft of the common size, cut one side of it in the form of a wedge, as if it were to be put into the stump, taking care to cut the wood part considerably more than half off, and from the other side take off the bark only, making a square joint; in this situation I put the graft into the stump between the wood and the bark, thus giving, as will be perceived, a free opportunity for the sap to circulate. I then cover the stump with common earth several inches deep, in the form of a cone, in order to have it shed rain, letting the top of the scion extend above the cone about two thirds of its length. I consider this a valuable improvement in the art of grafting.

I have forgot the time to stick limbs into the ground, but I believe it is three hours before the full of the moon, or three hours after; yet as I am not certain I would recommend that a limb be stuck into the ground every day of the moon, in order to ascertain the fact by experiment. I have raised apples these thirteen years by taking limbs from a grafted tree and sticking them into the green sward, where they found roots sufficient for growth and support.

When you wish to procure durable timber fall your trees in the longest days in June and July, the day before the change of the moon; if you fall trees that you want should rot as quick as possible, fall them in April, that being decidedly the best in the year, and the first quarter is better than the last quarter after the change. The first day after the change is the best to cause the timber to rot quick; after this every succeeding day is less favorable to the prospect of rotting, even up to the full. The last day before the full it will not rot much faster than the first day after the full. Timber cut in the wane of the moon will grow better from the last day after the wane up to the full. March is as good as May, and a great deal better than June, for the purpose last mentioned.

GOODSELL'S FLAX AND HEMP MACHINE.

We the undersigned have attentively examined the operation of Goodsell's Flax and Hemp Machine, at Greenbush, opposite to the city of Albany, and are of opinion, from the simplicity and solidity of its construction, and from its cheapness, and the rapidity with which one man can perform three separate processes in cleaning flax perfectly, in less than a minute, on so small a machine, not exceeding 200 lbs. weight, that it will be of great public utility, and will tend to promote the extended culture of flax and hemp, in a manner to become leading staples in the northern and western States. We do therefore recommend to all farmers to cultivate largely both flax and hemp the present year, in a full belief that they may safely repose confidence in the facilities they will derive by the introduction of said machine into general use.

DAVID LITTLE'S STATEMENT—ON RUTA BAGA.

Newbury, November 18, 1822.

To the Trustees of the Essex Agricultural Society.

GENTLEMEN—The following is a statement of the cultivation and produce of two half acres of land, adjoining each other, cultivated with Ruta Baga, on my farm—No. 1 & 2. The soil is a light sandy loam. In 1821 it was planted with corn, and manured with about two cords of manure to the acre. The crop was small. June, 1822, the land was ploughed, harrowed, and furrowed three feet apart. Three and a half cords of yard manure was put in the furrows. The manure was covered with a plough drawn by a horse, by turning a ridge upon it. The seed was then sowed, one row on each ridge—one pound of seed. July 4th it was ploughed between the rows, and I began weeding and thinning, and continued at intervals till August 8th, leaving them 10 or 12 inches apart in the rows. They were twice ploughed and hoed. There were about forty four rows; ten of them were sowed with seed that I bought in New-York, represented to be of Cobbett's raising, but on account of age, or some other defect, but few vegetated. The 6th of July they were sowed over again; but it being late, and the season unfavourable, the crop amounted to almost nothing, though occupying the best part of the land.—The land was measured and staked off in two half acres—No. 1. and No. 2. Lot No. 1 was harvested Nov. 4, and produced 251½ bushels. No. 2 was harvested the 7th, and produced 227 bushels.

Expense of cultivating the above lot of ruta бага, calculating labour at 4s. per day.

DAVID LITTLE.

DAVID LITTLE'S STATEMENT—ON MANGEL WURTZEL.

Newbury, November 18th, 1822.

To the Trustees of the Essex Agricultural Society.

GENTLEMEN—The following is a statement of the situation, cultivation, and production, of a lot of land cultivated with Mangel Wurtzel, on my farm. The situation is as follows: a swell inclining southwesterly, and of a rich yellow loam; in 1821 was cultivated with beets, manured with about three cords of compost manure, and produced about five hundred and thirty bushels; 1822, May 9th, ploughed, 10th, harrowed and furrowed three feet apart, four and a half cords of compost manure was put in the furrows, and was covered with a plough, then a harrow was drawn lengthways of the ridges, to smooth the ground; the seed was then sowed, one row on each ridge, with four pounds of seed, (I think less than half would be sufficient); commenced ploughing between the rows, and weed-

ing, June 10th; continued weeding and thinning at different times till they stood ten or twelve inches apart in July 16th. The work was done principally by boys, estimating two boys to be equal to a man. Oct. 31st, and Nov. 1st, and 2d, they were harvested by men and boys, and produced nine hundred and seventy and a half bushels of mangel wurtzel, two bushels of carrots, and one hundred and nine cabbages. Six swine were mostly fed with the thinnings, from the beginning of weeding till about the first of October; there were fruit trees on the above lot, sufficient, in my opinion to produce twenty one barrels of fruit. The land, that I supposed to contain an acre, when it was measured by the surveyor fell short about ten or twelve rods, and I was obliged to make out the acre by taking a small piece which adjoined the same, which was sowed late in the season, and produced a small crop, and also a piece of about five rods which adjoined, were transplanted in vacant places among carrots, on account of which my crop was much less. The above lot you will see has been divided by the surveyor, staked off in half acre lots, No. 1, and No. 2.—No. 1 produced five hundred and twenty three and a half bushels. No. 2 produced four hundred and forty seven bushels of mangel wurtzel, two bushels of carrots, and one hundred and nine cabbages.

The expense of cultivating the above lot of mangel wurtzel, calculating labour at four shillings per day.

Ploughing, May 9th,	\$1.50
Harrowing,	50
Furrowing,	50
Manure,	9.00
Ploughing a ridge over the manure, and harrowing,	1.00

Your obedient servant,
DAVID LITTLE.

EBENEZER BERRY'S STATEMENT—ON DEEP AND SHALLOW PLOUGHING.

To the Trustees of the Essex Agricultural Society.

Having learned that you had offered a premium, the present year, for the most satisfactory experiment in ascertaining the relative advantages of deep and shallow ploughing, I have been induced to offer for your examination the following statement.

In the autumn of 1821, my field was ploughed by the teams that contested for the premiums of your Society. It was laid out in lots of one quarter of an acre each. The land is level, and free from rocks. The soil is gravelly, and shallow, and only of middling quality. It had been in grass four years previous, and never had been highly manured. The common burden of grass produced upon it was not more than one ton to the acre. The whole field ploughed contained two acres and a half, one acre of which was ploughed in the spring of the present year; and on this part was the best crop. That which was ploughed in the preceding autumn at the ploughing match, was well harrowed in the spring, and furrowed, eight rows to the lot, two

rods wide. Twelve ox loads of manure were put to the acre, in the holes. The manure was a mixture of the droppings of horses and neat cattle, in about equal quantities, taken from the barn yard. The ground was planted with Indian corn, from the 10th to the 12th of May. The eight rowed corn, and that which is commonly cultivated in this vicinity, was the kind planted. It was hoed three times in the usual manner. Every part was managed as nearly similar as possible. Each lot was gathered and accurately measured by itself. Lots No. 2 and 3, were the most gravelly, and most exposed to the drought; and the whole field suffered considerably for want of moisture. I am of opinion that it would have been highly beneficial to have cross-ploughed the land in the spring. The following is the product of each of the lots.

No. 1, ploughed by 23 furrows, 4½ inches deep, situate on the western side, yielded twenty and a half bushels of ears.

No. 2, ploughed by 23 furrows, 6 inches deep yielded nineteen bushels of ears.

No. 3, ploughed by 22 furrows, 8 or 9 inches deep, yielded twenty-three bushels of ears. This ploughing was apparently deeper than the soil; but in the latter part of the season the crop suffered much less by the drought than either of the lots; and had the soil been as good the crop would have been much superior.

No. 4, ploughed by 23 furrows, 6½ inches deep, yielded twenty-two and a half bushels of ears.

No. 5, ploughed by 23 furrows, 6 inches deep yielded twenty-one bushels of ears.

No. 6, ploughed by 36 furrows, 6½ inches deep, yielded twenty-two and a half bushels of ears. The soil of this lot was rather better than the other parts of the field.

From the result of this experiment, my opinion is decidedly in favour of ploughing our land much deeper than is usually practised by our farmers. Especially is it beneficial on lands liable to be injured by drought.

EBENEZER BERRY.

Danvers, November 19, 1822.

To promote the Growth of Forest Trees.

It is highly to be censured, the neglect of permitting ivy-twines, which grow to forest trees, to remain attached to them. Their roots entering into the bark rob the trees of much of their nourishment; they in a manner strangle their supporters, by impeding the circulation of their juices, and in time destroy the trees.—They should be torn up by the roots, for, if any part of them adhere to the tree, they will spread, as they obtain nourishment by their adhering roots.—*English publication.*

Cause and Prevention of the Dry Rot.

The cause of the dry rot in wood is moisture; and to prevent well-dried timber from decaying above or under ground, is by charring it well.—*ibid.*

Method of trying the Goodness of Timber for Ship Building, used in the Arsenal at Vienna.

One person applies his ear to the centre of one end of the trunk, while another, with a key, hits the other end with a gentle stroke. If the tree be sound and good, the stroke will be distinctly heard at the other end, though the tree should be an 100 feet or more in length.—*ibid.*

From the London Farmers' Journal.

SIR—You probably know that farmers are in the habit of Manuring land by the eye, and in that way are liable to mistakes. I have found, in the Complete Grazier, a valuable table, and resuming the calculation to be accurate, I think its publication may be very useful.

I remain, yours, &c. —

East Greenwich, March 27.

The following table for manuring land, is extracted from an English work entitled the Complete Grazier:

No. of heaps to load.	No. of loads per acre.							
	1	2	3	4	5	6	7	8
At 5 yards distance.	193	96	64	48	38	31	27	24
At 5 1-2 do. do.	160	80	53	40	32	26	23	20
At 6 do. do.	134	67	44	33	26	21	19	16
At 6 1-2 do. do.	113	57	38	28	22	19	16	14
At 7 do. do.	96	49	32	24	19	16	14	12
At 7 1-2 do. do.	86	43	28	21	17	14	12	10
At 8 do. do.	75	37	25	18	15	12	10	9

Explanation of the first two rows of figures in the preceding table.

The number of heaps, consisting of one load each, laid at five yards distance, is 193 to cover one acre; at two heaps to a load, 96; at three heaps, 64; at four heaps, 48; and so to the end. Each of the following rows is to be read in a similar manner.

NEW ENGLAND FARMER.

SATURDAY, MAY 24, 1833.

The Farmer's and Gardener's Remembrancer.

MAY.

INDIAN CORN.—In our last, page 334, we gave some observations respecting the best mode of planting this valuable article. We now propose to pursue the same subject. There has been some dispute among farmers whether it is best to plant it in ridges, or on single furrows. We will just give some authorities in favour of the ridge cultivation, and then state what has been urged against it. In the Reports of the Agricultural Society of New Haven County we have the following statements.

Mr. Mallet, of Milford.—“When I plough my land for Indian corn, I always lay it in ridges, whether it be sward or mellow, and plough the balks up to the ridges, and those ridges I never disturb by cross ploughing, while my corn is upon the land. I am fully convinced by my own experience, and that of almost all my neighbours, who pursue the same method, that one fifth more of corn, at least, will be raised in this manner than in any other upon the same land.”

Mr. Holbrook, of Derby.—“Upon experiment, I find the method of ploughing land for Indian corn, heretofore recommended to the Society by Mr. Mallet, to be the best I pursue. I lay all my land of every kind, in ridges, when I intend it for Indian corn, and plough the balks clean, lay them to the ridges, before planting; I never disturb those ridges by cross ploughing. Any person can see by looking at the part of my field, which I have treated in this way, and at another part, of the same field, that was cross ploughed, that the part lying in ridges has much the advantage. I have always had evidence the same way upon experiment.”

Judge Chauncy, of New Haven.—“I have planted two acres of Indian corn this year. I ploughed in the manner recommended by Mr.

Mallet. The land has been mowed for five years past, and the sward is very tough. My crop is better than any of my neighbours have; and they agree with me that this method has increased it one third. From three years experience of this mode of ploughing Indian corn, I am fully confirmed in the opinion that its tendency is highly beneficial.”

S. W. Pomeroy, Esq. in an able treatise on “Indian Corn, and its Culture,” expresses his opinion in favour of ridge cultivation as follows. “Having a large bed of Beets planted in narrow rows, or drills, in the usual way, and a severe drought ensuing, the leaves were observed, in the middle of the day, to wilt and fall down, in all but the out-side rows, which remained erect and flourishing; and when the crop was taken up, were nearly double the size of those from the centre of the bed. That a greater exposure to the atmosphere was the principal cause could not be doubted; and the idea immediately presented, that if they had been cultivated on ridges, so far apart as to permit a plough to pass, it would in effect, be making the whole crop out side rows: and for upwards of fifteen years since, all the arable crops upon my farm have been cultivated on ridges, with manifest advantage—as to product, labour, and the unquestionable improvement of the soil.”*

On the other hand, Judge Peters, of Pennsylvania, in his “Notices for a young Farmer,” first published in the “Memoirs of the Philadelphia Agricultural Society,” says—“Unless its situation and circumstances forbid lay your cornfield level rather than in ridges, that moisture, in light soils especially, may be retained, instead of passing away, and if necessary, draw water-furrows, to carry off accidental flooding, by rains or other causes.” Col. Powell, of Philadelphia, a very able practical as well as scientific cultivator, says, “Among the various practices into which we have been seduced by the plausible theories of the advocates of British systems of husbandry, there is none which appears to me more absurd, than that which has led us to drill, or dibble our crops on ridges. The English farmer wisely contends with the evils produced by too much rain—the American husbandman should as anxiously guard against his most formidable enemy drought. I am inclined to think there is no crop cultivated in this state, which ought not to be put upon a flat surface.”† In England, we believe the ridge cultivation is less used than formerly, notwithstanding the dampness of the climate.‡

Notwithstanding the above mentioned apparent clashing of opinions, we believe that both parties may be correct. An able writer of a “Treatise on Agriculture,” originally published in the Albany Argus, in discussing the question of the different modes of ploughing [level or ridge ploughing] which is to be preferred, observes that “This question admits of no absolute answer. Stiff, heavy, wet clays, and in our opinion, all ground in which clay predominates, whatever be the culture should be made to take this form;” [that of ridge ploughing] “because it powerfully tends to drain the soil and carry off from the roots of the growing plants, that superfluous water, which, left to itself, would seriously affect both the quality and the quantity

* Mass. Agricultural Repository, vol. vi, p. 156, 157.

† See page 277.

‡ See an article headed Mangel Wurtzel, New England Farmer, page 28.

of their products.* In sandy, porous, dry soils, on the other hand, level ploughing is to be preferred, because ridging such soils would but increase that want of cohesion, which is their natural defect.

“A loamy soil [which is a medium between these two extremes] ought, in a dry climate, to be cultivated in a flat way, that it may better retain the moisture; and in a wet climate, in ridges, that it may the sooner become dry.”

We perceive that some writers on this subject have confounded the distinction between the cultivation of corn in rows or drills, and in ridges. We have before observed that corn planted in drills will yield a greater product than that which is planted in hills. This fact was established by an experiment made by Oliver Fiske, Esq. and detailed in the Massachusetts Agricultural Repository, vol. vi, p. 224. Mr. Pomeroy says, “If the land is in good heart and the manure abundant, the kernels may be six inches apart [the rows being five and an half feet apart] or as many dropped together [in each hill] as to insure four stalks to remain two feet apart, [from hill to hill] in which case the manure is deposited conformably, either method will give the same number of plants to the acre; I think four stalks together afford support to each other against winds, and are not so apt to send up suckers as when single.† In putting the seed corn into the hills be careful that the kernels do not stand very near together lest the roots interfere too much with each other. Dr. Samuel Black, of Delaware, advises to plant corn in such a manner that the rows may run directly north and south. In Gen. Hull's mode as detailed page 265 of our paper, furrows were drawn north and south three and an half feet apart. No ridges were formed. Hills were then made with the hoe in these furrows two feet apart, not flat but descending to the south with a small bank on the north side of each hill for the purpose of giving the young plants a fairer exposure to the sun.

Mr. John Stevens, of Hoboken, N. Jersey, raised on an acre 118 bushels and two quarts: and was confident that he should have had a still larger crop, had it not been beaten down by a thunder storm. He ploughed his land three times before planting, and before the last planting, put on, (as report says) no less than 700 horse cart loads of street manure; and planted in double rows at 5½ feet between each set of double rows, and dibbled in each kernel in such a manner that the plants were 3 inches apart in the rows, and stood diagonally. In order to perform this with expedition he bored two rows of holes in a piece of board four feet long, so as to form equilateral triangles the sides of which were 3 inches thus

Into these holes he drove pegs about 3½ inches long, fitted a handle to the board, and, with this simple machine dibbled the holes, in which the corn was dropped. A man followed with a basket of well rotted dung, with which he filled the holes. Then came on the carts, out of

* “It has been objected to ridge ploughing, that it accumulates the good soil on the crowns of the ridges, and impoverishes the sides and furrows. These objections are obviated by narrow and low ridges, which alternate every crop with the furrows.”

† Mass. Agricultural Repository, vol. vi, p. 156

which the rows were sprinkled with a coat of street manure.

Mr. Lemuel Davis, in a communication to the Worcester Agricultural Society [see page 8 of the N. England Farmer] recommends to "furrow the ground four feet apart from centre to centre—to plant the corn in two rows, nine inches apart, diamond fashion. It is a very simple process, to level the manure when spread in the furrows, and take a pair of small wheels, with pegs in them, made for that purpose, put them on an axle-tree nine inches apart, which will dot the ground with accuracy, when drawn across the field so that a child of ten years may drop the corn without the least difficulty."

The distance at which the corn should be planted, either in hills or rows, depends on the size of the kind of corn you plant. In the southern states the corn is generally planted at the distance of seven or seven and an half feet from hill to hill in every direction, when four or five stalks are suffered to grow in each hill; or four feet apart, when two stalks only are permitted to stand in each hill. Mr. Cooper, of New-Jersey, a celebrated agriculturist says, "In every kind of soil I have tried, I find planting the rows six feet asunder each way, as near at right angles as may be, and leaving not more than three stalks in a hill produces the best crop."

Mr. Deane directed to let the ground be cut into exact squares by shoal furrows made with a horse plough, from three to four feet apart, according to the largeness or smallness of the kind to be planted, and to put five corns in the places where the furrows cross each other.

"Shell seed gently by hand that it may not be torn or bruised at all rejecting about an inch at each end of the ear. And if any corn appear with black eyes, let them also be rejected, not because they will not grow at all, the contrary being true; but because the blackness indicates either some defect in drying, or want of perfection in the grain.

"Some steep their seed. But in general it had better be omitted; for it will occasion it to perish in the ground, if the weather should not prove warm enough to bring it up speedily. If planting a second time should become necessary, by means of the destruction of the first seed; or if planting be delayed on any account till the beginning of June, then it will be proper that the seed should have boiling water poured on it. Let it not soak more than half a minute, and be cooled speedily, and planted before it dries. The corn will be forwarded in its growth several days. The seed should be covered with about two inches of earth." Judge Peters says "the seed should be wetted and rolled in plaster, or steeped in a decoction of Bellebore or opoponax: or what produces a surprising effect, a strong solution of salt petre; but do not soak or steep it too much. In dry weather, the germination is accelerated by the steeping injuriously; so that the plume and radicles perish; and in long wet seasons they rot."

There have been a variety of other methods recommended for preparing seed corn in such a manner as to preserve it from birds and insects. Dr. Deane directed to "steep some corn in a strong infusion of Indian poke, or refuse tobacco, and sprinkle it over the ground before the crop is up. White threads stretched over a field of corn, will prevent crows from alighting

upon it. But I doubt whether this will deter any other birds."

It has been often recommended to pour warm tar over seed corn, and stir it in such a manner that every grain may receive a coat of tar, and then roll it in ashes, or plaster of Paris. Seed dealt with in this manner will not be pulled up by birds, neither will it come up at all, unless it is well soaked before the tar is applied. The tar makes a coat or enclosure for the kernels, which will not suffer moisture to penetrate it so as to cause vegetation. It would be better, we imagine, to pour water over tar or turpentine, and let it stand two or three days, till it becomes strongly impregnated with those substances. In this water soak your seed corn, and then roll it while wet, and just before planting, in plaister. Supposing also you should boil a few elder roots in this water before you turn it on the tar.

The soil having been broken up from five to seven inches deep, or if more the better, requires shallow planting. When you plant on what is called green sward land, or grass land, merely turned over without ploughing, holes should be made quite through the furrows, and dung put into the holes. If this caution be not observed the crop will be uneven, as the roots in some places, where the furrows are thickest, will have but little benefit from the rotting of the sward. But if the holes are made through the roots will be fed with both fixed and putrid air, supplied by the fermentation in the grass roots of the turf.

REMEDY FOR WORMS IN THE HEAD OF SHEEP.

In our paper No. 26, page 205, may be found some account of this disorder, its causes, and its symptoms. We shall, however, in this place, give a brief recapitulation of them, and mention a simple preventive remedy which a gentleman assures us is infallible. The disorder is caused by grubs, a kind of bots proceeding from a large bee called by scientific writers *Oestrus Ovis*.—The bee lays its eggs in the nostrils of the sheep the last of August or first of September, where they soon hatch, so that by the 20th of the month you may discover in the cavity between the nostrils and the wind pipe, from 25 to 100 small white grubs, with black heads, and a black streak on the back. They obtain their growth in July or August of the following season. The symptoms appear towards spring, at which time the infected animal shows appearances of the disorder by a sickly countenance, wasting of the flesh, and apparent attempts to blow something from the nose. The wool stops growing, generally much of it falls off; many of the lambs are lost, and those which live are stunted by reason of the ewes being poor and sickly, and consequently giving but little milk. Sometimes the sheep affected lingers along, pining away continually, and dies in June or July.

These worms or sheep-bots are very tenacious of life, and will exist for some time in alcohol, sulphuric acid, spirits of turpentine, &c. The usual remedies are vinegar, a decoction of tobacco, assafoetida, &c. injected into the nostrils of the sheep. Dry snuff blown up the nose with a quill is likewise sometimes made use of. These are all troublesome and uncertain. The remedy recommended by our informant, who says he has had abundant experience of its efficacy, is to smear the nose of the sheep with tar. Apply it before the fly makes its appearance,

and continue its application till the time of its departure. It would, probably, be safest to begin to use it about the first of August, and continue its use till the last of September. We do not learn how often the tar should be put on but would advise to keep the nose constantly smirched so that it may be visible. Tar is likewise said to be an excellent remedy for consumption of the lungs, cough, rot, &c. in sheep. It promotes and confirms the health of the animals, and operates as a specific against nearly all the diseases to which they are subject.

The celebrated anatomist VERHEYN, who was buried in the public cemetery in Louvain, is said to have been worthy of the following epitaph, which was inscribed on his tomb:

PHILIPPUS VERHEYN,
Medicinar doctor et professor;
Partem sui Materialem,
Hic
In coemeterio condi voluit,
Ne templum dehonestaret,
Aut nocivis halitibus inficeret

TRANSLATION.

Here lies deposited the mortal part
Of one devoted to the healing art,
PHILIP VERHEYN, a sage who thought it best,
The dead should in their cemeteries rest,
Beneath some distant and secluded sod,
Not poison and pollute the HOUSE OF GOD.

Mortification.—Dr. Ainslie, of the British East India Company, has written a letter to the Editor of the Courier, stating, that he has discovered that the *Balsam of Peru* is a sovereign remedy to arrest the progress of mortification. The mode of using it is to dip a piece of lint in the balsam and lay it over the affected part the moment mortification appears; then to be repeated morning and evening until healthy granulations shall appear, then simple dressing will answer. The doctor says he was first induced to try the efficacy of the balsam in the torrid zone, in consequence of its antiseptic qualities, and its peculiar grateful odour, which so admirably conceals the fætor of putrefaction. He says it smarts a good deal for a minute or two and then feels quite grateful. It is a valuable discovery if it be found efficacious.

FOREIGN.

LATE AND IMPORTANT NEWS.

The Packet Ship Leeds, Capt. Stoddart, lately arrived at New York, brought files of papers from London to the 22d, and from Liverpool to the 24th April, sixteen days later than had been before received. On the 7th of April the French passed the Bidasso, the frontier river, and advanced into Spain. They, previously, had a skirmish with some straggling French and Italians, in which the latter were dispersed with the loss of fifteen killed and wounded. Four French officers were likewise wounded. At St. Sebastian the French received a check, with the loss, according to some accounts, of about 800 killed and wounded. A letter from Paris states that the French army goes on but slowly—they had experienced two defeats before St. Sebastian and Pampeluna. The constitutionalist fight with a desperation not expected by the French. The affair at St. Sebastian, according to private accounts, was very serious, and the hospitals were full of French soldiers. The royalists at Valencia, according to a Madrid article, have been defeated with the loss of 1600 killed and made prisoners. The Duke d'Angoulême has issued a proclamation, much in the usual style of such articles, in which the Spaniards are, in substance, informed that they are to be attacked for their own benefit. "I am about," he says, "to cross the Pyrenees, at the head of a hundred thousand Frenchmen, but it is to support the Spaniards who are the friends to order and the laws; and to aid them to

berate their captive King; to raise again the altar and the throne," &c. Flying columns of light troops move about between the Pyrenees and the Ebro. They over round the French, harass them and leave them nothing to eat. It is declared that the most determined spirit of hostility is every where prevalent throughout Spain against the French, and that no idea of submission existed. It is also said that Mina, at the head of a formidable body, had invaded France.

The French government, it is stated, acting on the principle that France is not at war with the Spanish sovereign and nation, but only with a faction, will not grant any letters of marque, nor permit any privateers to be fitted out.

All the Constitutional Spaniards in France are ordered to leave the Kingdom.

England appears to be determined to preserve a system of neutrality on certain specified conditions. In Parliament, on the 17th April, Mr. Canning and Mr. Brougham exhibited a rough outline of a quarrel, but before they could finish the sketch they were threatened to be taken into custody of the Sergeant at Arms. Mr. B. accused Mr. C. of "monstrous trucking for the purpose of obtaining office." Mr. C. replied, "I use to say that that is false." Certain explanations and modifications ensued, which brought about a reconciliation without the intervention of the weighty and conclusive arguments which are prescribed by the modern code of honor as necessary to settle such a controversy.

London, April 21.—Extract of a letter from Paris, dated Saturday evening: "The French frigate *La Guerriere*, has been taken almost in sight of Brest, by two armed vessels bearing Spanish colors, one of which was a brig carrying 15 or 20 guns. The frigate was peppered in high style. You may rely upon the truth of this."

In the British Parliament, April 14th, the promised statements were made relative to the diplomatic proceedings with the foreign powers. After giving a history of the negotiations, and the unavailing attempts to preserve peace, Mr. Canning communicated a copy of his last despatch to be communicated to the French government. This despatch states—

"That England does not expect France to establish military occupation of Spain, nor to force the King or any measures derogatory to his crown, or to his existing relations with other powers.

"That she expects the dominions of Portugal will be respected.

"That she expects no attempt will be made by France to bring under her dominion any of the American Provinces which have thrown off their allegiance to Spain.

"That a frank explanation upon these points was necessary, in order that England might maintain a strict neutrality."

Mr. Canning then stated that assurances had been received that no intention had existed in France of attacking Portugal. He further stated, that no hope had ever been held out to Spain that England would pursue any other course than a strict neutrality, which she was still resolved upon. He concluded by expressing a hope that Spain would come off triumphant.

From the Daily Advertiser.

THE STATE OF THE SEASON.

MR. HALE—I have for so many years given some account of the progress of vegetation, that I find my friends, in town and country, look for it. It is perhaps of as much use as the diaries of the weather, and common thermometrical statements. In some short remarks, which I sent you early in this month, I observed that, though the season was exactly one month behind the last, in the beginning of April, yet like the Siberian summer, it had advanced so rapidly, that on the first of May it had caught even the precocity of the last season. After that communication, long continued cold easterly and northerly winds set in. On the 6th of May ice was made in the country, sufficient to bear a

child of ten years of age, and all the appearances of the progress of vegetation ceased. The buds half started from their winter protection, remained for fourteen days, nearly quiescent—yet the season has advanced within a few days and has acquired an average rate of forwardness. Rains have been most abundant—springs which had been deficient for two years are amply supplied—the grass is well set, and the season promises abundantly as to all the fruits except apples. The shew of pear blossoms never was exceeded—the country is literally white with them. The apples will of course be less numerous, owing to the extraordinary efforts of the trees last year—yet there will be an ample quantity, and while less loss will be sustained by the cultivator, the consumer will feel no failure in the supply. If apples may be a little dearer, the more important article of hay will probably be cheaper. It will be impracticable to give a schedule of the progress of the various seasons without repetition—yet few persons preserve the statements of former years, and it is not possible to give a correct view without comparing many years. This will enable the curious to make useful remarks—and it will convince all, that however different the weather, and the progress of vegetation, we have a superintending Providence above us all, who regulates all seasons in mercy, and compensates by the heat or moisture at one moment, all that may be deficient in another.

The statements are made from the same tree or plant—in the same exposure, and situation, and therefore not liable to the variations which would appear from transient observations of passengers or travellers.

The Cherry—its first opening,

In 1813, May 10	In 1815, May 10
In 1816, May 6*	In 1817, May 6
In 1818, May 17	In 1819, May 6
In 1820, May 2	In 1821, May 9
In 1822, May 1	In 1823, May 7

* This was the most disastrously cold year afterwards.

The Pear—its first opening,

In 1813,* May 20	In 1815, May 20
In 1816,† May 12	In 1817, May 7
In 1818,‡ May 24	In 1819, May 17
In 1820, May 9	In 1821, May 13
In 1822, May 4	In 1823, May 13

* Cherries opened this year on the 10th of May, but cold winds kept back the pears to the 20th.

† This was an exceedingly cold season afterwards.

‡ This season deserves notice, for though so late it was a fine one.

The Apple—its first opening,

In 1813, May 23	In 1815, May 25
In 1816, May 13	In 1817, May 12
In 1818, May 25	In 1819, May 19
In 1820, May 11	In 1821, May 13
In 1822, May 9	In 1823, May 19

I will add the Lilac, the ornament of our Election day.

In 1817, May 19	In 1818, May 27
In 1819, May 25	In 1820, May 20
In 1821, May 20	In 1822, May 12
In 1823, May 22	

Thus it will be seen, that the present season is about an average one in point of forwardness, while it is far above the average in its verdure and promise.

N. B.—There is some danger, that seeds of squashes and other tender plants committed to the ground early in May, have rotted and will require replanting. It is, we know, the fact in some places.

A ROXBURY FARMER.

Roxbury, May 22, 1823

Irish Trick.—The Marquis of Wellesley, in an official despatch, gives the following statement of Irish cunning, which is quite up to any yankee trick we have heard or read of. In speaking of the burning of stacks of grain by the white boys, or Irish rebels, he observes:

"It is a curious circumstance, however, in the character of these transactions, that, in several instances, the grain had been actually separated from the straw, and had been sold by the proprietor of the stacks for its full value, and that the same proprietor had destroyed the stacks of straw by fire, with a view of recovering from the barony the full value of corn already sold. These cases were not unfrequent. The incendiary was of course undiscoverable. The fact of such numerous and frequent conflagrations was alleged to be an indisputable proof of general combinations, until the vigilance of the military and police actually detected a considerable number of the stacks of straw cleared of the grain, and prepared for the fire, and thus discovered the whole mystery of this double fraud."

Of the numbers of the N. E. Farmer already published, only forty sets remain on hand, and they are daily called for. Those, therefore, who wish for the first volume complete, must apply immediately. May 24.

AMERICAN SKETCHES.

THE FARMER'S FIRE-SIDE.

Shade of immortal Burns! where'er thy home,
On Scotia's misty hills, or fixed on high,
Beyond the star-lights of the welkin dome,
Too holy, and too bright for mortal eye,
Mid amber streams and murmuring melody,
Great bard of lowly life! propitious bend,
And while the rustic song, unskill'd, I try,
Thy love of truth and independence lend.
And with its warblings wild, thy master spirit blend.
The world I've search'd, and it has many a rose—
But, ah! the thorns beneath them that remain,
Proclaim the world not destitute of woes,
And, when I look'd for pleasure, give but pain.
No more amid its scenes my soul restrain;
Back to my boyish days! Let memory guide
The tired and flagging spirit once again.
To scenes most dear—to hill and rolling tide,
And that old cottage, once that grac'd its verdant side.
Meekly arose its moss-besprinkled wall,
One ancient beech magnificently bore
Its branches o'er it, overshadowing all
The space around its hospitable door;
Within, might one behold its little store,
The plates well rang'd, the shelves that neatly grac'd,
The chairs of oak upon the sanded floor,
The wheel industrious in its corner plac'd,
The clock, that hourly told, how life runs on to waste.
Once more the pensive eye with silent tread
Returns to hush the noisy world to peace;
Once more the Farmer seeks his humble shed,
Glad from his daily toil to gain release;
His task accomplish'd and his heart at ease,
He hails betimes the Fireside of his cot;
And there, as from the hills the shades increase,
"The world forgetting, by the world forgot,"
He tastes the simple joys, that sooth his quiet lot.
His patient herd, ere set the beams of day,
With lowings oft, alarm'd the neighboring plain,
Now penn'd within the well-known bars, they pay
Their milky tribute to his pails again.
His flocks upon the distant hill remain,
Their tinkling bells sound in the passing wind;
Though his be not the lordling's wide domain,
Yet fails he not a due supply to find,
From lowing herd and field, and from the bleating kind.
To greet him home, the crackling faggots burn,
The housewife, busy round the blazing fire,
Cheers, with her smiles her Farmers lov'd return;
His children climb around their honor'd sire,
And to his fond caress once more aspire;
Inquisitive, they ask of each fair field,
Whether its hills, than their own cliffs are higher?
What wonders there of cascade are reveal'd?
What flowers enchanting bloom, what gifts the moun-
tains yield?
Her father's kine, his Bertha soon surmounts,
Around his neck her tender arms she throws,
His Bertha, from whose eyes like diamond founts,
The living fire through locks of ebony glows.
Nor she alone; he on them all bestows
Alike his kisses and alike his tears,
Who bloomed (on autumn's bosom, like the rose,
'Mid cold and storm its loveliness that rears,)
To cheer his ripper age, and deck his rarer years.
To him, how bless'd the closing hours of day!
His wife, his children, those that love him, near!
How sweet his cot's own hospitable ray!
How kind its welcome, and its joys how dear!
The cricket chirps, the sacred scene to cheer,
The embers half illumine the humble hall,
The shaggy mastiff sleeps, devoid of fear,
The playful kitten round and round the ball
Urges with active sport, unmindfully of all.
The children mingle in Grimalkin's mirth,
And laugh and busy prattle do not spare,
Such cheerful sport, the chirper in the hearth,
Scenes, which ere returning doth repair,
Charm from the Farmer's bosom carping care,
And banish it to "blank oblivion foul."
Hark! loud and startling through the misty air,
The prowling wolf resumes his nightly howl,
And from the hollow oak is heard the muffled owl.

How oft I've sought that distant, lonely cot!
A grandam dwelt there, when my days were young,
And there, when Christmas logs blazed red and hot,
And wintry blasts their nightly descant sung,
My soul delighted on her lips was hung,
As spoke she oft of dreadful deeds of yore,
How stern Wahiawa, like a tiger sprung
Upon a lonely cot, and tides of gore
Were shed, as when the clouds their vernal treasures
pour.

Her hands were withered, as an autumn's leaf,
Her cheeks were like a parch'd and shrivel'd scroll,
In truth, though human life at best be brief,
She witness'd eighty years their circuits roll,
And friends and kindred reach'd their earthly goal;
And sitting by her busy wheel to spin,
While swift the hours at evening onward stole,
We treaz'd her oft some story to begin,
And as she mov'd in sooth her old projecting chin,
She told of Mogg, Madockawando, all
From Hopewood down to Paugus' frantic yell,
And, as her lips the bloody deeds recall,
And, as with upturn'd gaze we heard her tell,
Unconsciously the chrystal tear-drops fell,
For, from our infancy, we'd heard and read
Of Chiefs from Canada, and knew full well
Of Sachem's wrath, that feasted on the dead,
And shook the haughty plume and arm with life-blood
red.

My native hills, my loved, my honored land,
Ye vallies dear, how cling my thoughts to you!
Long as my footsteps tread this earthly strand,
The throbs that heave my bosom shall be true,
To all the witching scenes that childhood knew;
'Tis joy, 'tis heaven to breathe one's natal air,
To climb the hills, deck'd in the morning's dew,
And bending o'er our fathers' graves, to swear
No tyrant shall disturb the dust that slumbers there.

Such scenes, such tales, such homebred ties, can fill
With fervid ecstasy, the raptur'd mind,
And teach with patriot glow the breast to thrill,
And beat to all that's noble, generous, kind;
One evening to that cot my steps inclin'd,
The giant beech-tree wav'd before its door,
The distant clouds were driven before the wind,
The mountain cataract was heard to roar,
Paler the tranquil moon, than foam on ocean's shore.

There too, a soldier bent his nightly way,
Who'd borne his rifle in the old French war,
And mingled oft in many a bloody fray,
And bore upon his visage many a scar;
Weary his step, his own lov'd home was far,
The locks upon his silver'd head were few,
His eye was like the winter's clouded star,
The arm, that once the glittering broad sword drew,
Was nerveless now with years, yet much he'd seen
and knew.

The staff, that in his dexter hand he bore,
Was parted from an oak, whose branches spread
Near wild Cowheco's oft remembered roar;
And bending to the Farmer's cot his tread,
He gave one rap, and well his purpose sped;
The Farmer hail'd him to his lone abode,
Gave him a portion of his cup and bread,
And soon, forgetful of the tedious road,
How fields were lost and won, the aged soldier show'd.

In Fifty-nine, on Abraham's blood-red plain,
(The veteran thus pursued his warlike tale.)
When heroes fell, like summer drops of rain,
When rival standards flash'd upon the gale,
And shouts were heard, triumphant songs and wail,
Where Cadaraqui holds his giant way,
I fought with Wolfe, call'd from the dear-lov'd vale,
And dark Piscatawa's glades of green array
To cross the mountains blue to distant Canada.

Hard was the tug of war, severe the strife,
Plumes, swords and ensigns swept along the field,
Full many a warrior, prodigal of life,
Too bold to flee, too proud of soul to yield,
His valor with his dearest life-blood seal'd;
Slow bowed in dust, fell Lewis of Montcalm,
To neither host was triumph yet reveal'd,
Oh, wither'd be the soul that wrought such harm,
Soon Wolfe falls, bleeding, low, nerveless his mighty
arm.

A soldier lifted up his drooping head,
Dim grew th' ethereal flashes of his eye,
And from his breast the streams gush'd darkly red,
And every gush heav'd forth a blacker dye;
High rose the clamorous shout, "they fly, they fly!"
'Who fly?' arous'd to life, the hero cried,
A thousand lips awake the joyous cry,
'The foe, the foe!'—the gallant Wolfe replied,
Clasping his hands in praise, "I fall content," and died

Thus spoke the soldier! peace, ye mighty dead!
Be yours both peace and glory, chiefs of yore!
Who clad in armor generously shed,
Where clashing steel met steel, roar answer'd roar,
For home and liberty your bosom's gore!
Thanks be to Him who our brave fathers nerv'd,
Boldly to stand, when fiery floods came o'er,
From honor's upright path, who never swerv'd,
To ages then unborn, who freedom, bliss preserv'd.

And tho' such tales were heard with many a tear,
And memory, fancy, feeling, all possess'd,
Yet soon, in truth, the gaiety and cheer,
That ever animate the youthful breast,
By solemn thoughts, unconquer'd, unsuppress'd,
Awoke in sports anew; the slipper's sound,
By youth and village maiden, ne'er at rest,
Was driven through the circle round and round,
And every cheek did smile, and every heart did bound

Then the old soldier felt his bosom thrill
With memory of scenes, that erst he knew;
The visions of the past his spirit fill,
And as around the room the younglings flew,
At blind-man's-buff, he would have join'd them too
But age to youth will not wing back its flight;
To sit and smile was all that he could do,
And bravely cry out, "wheel, and left, and right,"
To him who blinded was, and caught them as he might

At blind-man's-buff, who hath not often play'd,
At pledges oft the moments to beguile,
When sober evening lends her peaceful shade;
When heart replies to heart, and smile to smile?
The hearth is burned with the oak's pile,
Such as New Hampshire's forests well can spare;
Still flies the slipper round; a few meanwhile
The warriors of the chequer-board prepare,
The garrulous old folk draw round the fire, the chair.

But now the white moon, thro' the clouds reveal'd,
Doth tread the topmost arches of the sky;
The farmer's cot, the cultivated field,
The brook, the plain, the mountain soaring high,
Beneath her beams in wild profusion lie;
The dog upon the ground hath laid his breast,
Forgotten his howl and sealed his restless eye,
The sturdy wood-cutter hath gone to rest,
The flock is on the hill, the bird is on the nest.

Farewell, thou cottage, for 'tis late at eve,
Farewell, ye scenes to memory ever dear,
Now old, and youth, and maiden take their leave,
Their kerchiefs wave, and with adieu sincere,
The rural company soon disappear,
Some thro' yon scatter'd woods that skirt the moor,
Some to yon mountains, craggy, bold and drear,
And by the Cottage Fireside once more,
Devotion lifts her voice, as she was wont of yore.

The patriot Farmer reads the sacred Book,
Then with the wife and children of his heart,
With solemn soul and reverential look,
He humbly kneels, as is the Christian's part,
And worships Thee, our Father, Thee, who art
The good man's hope, the poor man's only stay,
Who hast a balm for sorrow's keenest dart,
A smile for those, to Thee who humbly pray,
Which, like the morning sun, drives every cloud away

Thou Lord of heaven above, and earth below,
Our maker, friend, our guardian, and our all,
The Farmer keep from every want and woe,
Nor let the thunderbolts, that most appal,
Of righteous vengeance dreadful on him fall;
With him, preserve his dear, his native land,
A cloud be round her, and a fiery wall,
With thy displeasure every traitor brand,
And centuries yet to come, oh, hold her in thy hand.

VOL. I.

BOSTON, SATURDAY, MAY 31, 1823.

No. 44.

REPORT,

DELIVERED BEFORE THE

PROVINCIAL AGRICULTURAL SOCIETY.

(Continued from page 338.)

The second and the last part of this Report was to take notice of any circumstances which have transpired during the last year, either to encourage hope in the ultimate accomplishment of our independence, or to suggest the need of wise precautions against the evils with which it may be threatened.

The only circumstance of this latter description, worthy of regard, has been the disturbance of the relation naturally subsisting between the prices of bread corn and of meat. When we consult any tables of the rates of provisions either in Britain, France, Germany, or other European countries, we shall find this rule to hold universally, that butcher meat is double the price of flour, and butter double that of meat; as for instance, when flour is quoted at 2d per pound, beef is at 4d and butter at 8d—the second being double, and the last quadruple of the first; and that these rules have obtained not at one time and in one place, but as far back as there are authentic annals, and in every nation where statistical accounts have been preserved.* It cannot be denied that these relations are perpetually disturbed by the operation of demand and supply; but still, whenever any of the articles rise above, or sink below the assumed standard, there is a tendency in the prices to adjust themselves at the points of equilibrium.

* As the proportion of prices here stated to exist between flour, meat, and butter, may be considered as purely hypothetical, I shall present some tables, constructed on minutes taken by Arthur Young in France and in England. Just before the breaking out of the revolution, that gentleman landed at Calais, for the purpose of taking a survey of French husbandry; and in the prosecution of his plan, noted down every thing relating to wages, provisions, the methods of cultivation, the nature of crops, manures, and in short all sort of materials which might serve as data for the political economist. These minutes were taken in 1787 to 1789 in all the departments of France; for he traversed that kingdom by three separate routes, and therefore his general averages are fairly drawn. In looking into the particular minutes, I observe that the relation between the prices of meat, butter and bread is somewhat disturbed. In arable districts, for instance, bread is lower, and meat and butter are higher than the general average; and the reverse takes place in tracts fitted for pasturage; yet the ratio on an average of the whole kingdom, comes out with wonderful accuracy. Travels in France, vol. i, p. 441—under the article, Price of Provisions.

RECAPITULATION.

	French Money.	English Money.
Beef per lb. on average of 76 minutes	7 f.	3 1-2
Mutton do.	7	3 1-2
Veal of 72 minutes	7 1-2	3 3-4
Pork of 28 minutes	9	4 1-2
Butter of 33 minutes	16 3-4	3 1-2
Bread of 67 minutes	3	1 1-2

A pound of bread, notwithstanding the labor of baking it, is always cheaper than a pound of flour, because the former is to the latter as 36 to 26, that is to say, 20 lbs of flour will, after adding water, salt and yeast, make, in all ordinary cases, 36 lbs of bread. Flour, therefore, in France, could not be less than 2d per lb. when bread was at 3 sous. The proportions then in France, from these numerous and extended minutes

brim. The great reason for this difference of value lies in the cost of production. A farmer can raise a pound of oatmeal or flour much more easily than he can raise a pound of beef or mutton; and therefore he should be rateably paid for his labor. But moreover, meat is more nutritious, or capable of sustaining the body longer, quantity for quantity, than bread corn; and on this other account an effective demand will always exist for the former at double the prices of the latter. Amongst us during this last year the relation subsisting between these two articles of farm produce has been entirely subverted. Beef during the greater part of winter could be purchased at 1 1/2d or 2d per lb. while oatmeal commanded 17s 6d, and flour 20s per cwt. At the present moment beef is worth 3d in the market, and superfine flour at 9 dolls. per barrel—that is at 2 1/2d per pound. This is a complete subversion of the order which holds in Europe, and demands the most serious and grave deliberation, as involving the prosperity of our rural economy. One grand error in this country has been the want of arithmetical calculation, in reckoning up the cost of the different sorts of produce which are brought to market. Few have any just idea of what it takes to rear a pig, a lamb, or a calf. Our farmers are thus ignorant, in a great measure, of relative prices dependent on the expense of production, and they conduct their sales under the guidance of the blindest chance. No man surely dare affirm that a given quantity of meat can be raised as cheap as a given quantity of flour, and yet so it is that the former during the whole of last winter has been lower than the latter. In England, where agriculturists put down every item of expense under its appropriate head, and keep books on as correct principles as does the merchant, it is recognized as an invariable rule, that unless beef fetch double of flour, the occupier should break up his grass lands and bring them under tillage. The relation in price between these two produces a perpetual oscillation between pasturage and tillage, and determines the farmer in the destination of his fields.

may be justly quoted as follows—Flour at 2d, meat on an average of all the sorts nearly 4d, and butter at 8 1-4d per lb.

By the same writer, and in the same place, it is said that in England the prices in 1790 were

Beef	at 4d. per lb.
Mutton	4 1-2
Veal	4 1-2
Pork	4
Bread	1 3-4 equal to flour at 2 1-4 per lb.

In further corroboration of these relative prices, see Young's Tour, East of England, performed 20 years before, in 1770, vol. iv, p. 302.

Beef, average of 57 places, 3 1-2d per lb.
Butter do. 6 1-2
Bread do. 1 1-2 flour being 1 3-4 lb.

See also his Tour in Ireland in 1776 to 1778, vol. ii, page 149.

Beef on an average of the Kingdom	2 1-2d per lb.
Mutton do.	2 3-4
Veal do.	3 1-2
Average of the above 3 meats is a fraction short of 3d.	
Butter	5 3-4

The price of Bread is not mentioned, because the peasantry lived chiefly on potatoes.

He tills more when bread rises above, and less when it descends below its proper level.*

I have been at the more pains to set this proposition in a plain light, because of its vital importance connected with our present condition and future prospects. The opinion has been long popular, that the province was fitted to be a pastoral rather than an agricultural country; and this has been received without much examination, and gained an almost universal assent. It has not failed to produce a strong effect on rural industry, and to create a corresponding bias towards the hay culture.—On this account our finest lands have been laid down to grass, and our marshes, which under the French were fruitful of corn, and were alternately under fallow and wheat, have ceased

* It will be found by recurring to our last *Price Current*, p. 343, that superfine Flour is about \$3 a barrel, which contains 196 lbs. and will give 4 cents 1-10th nearly per lb. Beef, best pieces, from 8 to 9 cents, and lump Butter from 18 to 20 cents. That is, butcher's meat is about double the price of flour, and butter double that of meat, which, according to the author of this report, are about the same relative proportions which these articles of provision bear in "Britain, France, Germany, or other European countries." It would seem, therefore, that in New England, there is no reason, to be derived from the state of the market prices of these articles in Boston, for any "oscillation between pasturage and tillage." The relative prices which are given for rye-meal and Indian-meal, compared with the price of flour, appear to us to be about correct, and prove, so far as the rules of the able author of the Report ought to influence our tillage, that New England farmers have, as a body, decided not improperly in "determining the destination of their fields."

There are, moreover, a variety of considerations to be taken into view, as respects the most profitable kind of culture. If a farmer lives at a great distance from market, butter, beef & pork will perhaps be found most profitable, because most easily conveyed to the place of sale. The nature of the soil, the facility of procuring manure, the price of labor, &c. &c. are items of importance in determining between grain and grass cultivation. In the neighborhood of large towns, where manure can be had cheap and in any quantity, and the soil is suited to arable cultivation, Indian corn and other grain may be raised and sent to market to greater profit than in the interior, because the transport is not so serious an item of charge. Besides, it may be said of farms situated at some distance from populous places, without cattle you will have no manure, and without manure, no grain. But in the neighborhood of a large town, manure, and of course grain, may be had without cattle.

In Great Britain, according to Sir John Sinclair, the grain cultivation is carried to an extreme. He says, "It cannot be doubted that if one-fourth part of the land, which at present is sown with corn [grain] were properly laid down in grass, for the purpose of feeding stock, it would be of the greatest benefit both to the farmer and the public, as the other three-fourths would be better manured, more easily cultivated, and would produce as much for consumption as the whole now does."—*Ed. N. E. Farmer*.

to be considered as arable, and been well fitted set apart for the exclusive support of live stock. This practice has been one of the chief sources of the depression of our agriculture, and has served too long to perpetuate distress, embarrassment and poverty. The very reverse of this favorite opinion will, I apprehend, turn out to be correct; namely, that this Province is much better calculated for agricultural than for pastoral purposes.

In corroboration of this novel statement, it may be stated that a cwt. of oatmeal or flour can be raised at less expense in Nova Scotia than in Britain. To pave the way for our concurrence in this position, we may boldly refer to the comparative fertility of the two countries; and we can be justified on the best documentary evidence, if not to exalt our own above England, at least to set it on a footing of equality. Our acre will yield as much as theirs, if cultivated with like skill and capital. Should this be granted, the point at issue is no longer doubtful; because the burdens affecting land are here light and trivial compared with the taxation which the English farmers must bear. Tithes, poor rates, direct and indirect taxes, jointly contribute to swell the charge of production and add to the first cost of their bread corn. In all these points of view ours have confessedly the advantage; and are only inferior to them in a higher rate of wages.

But if the balance be in our favor with respect to the raising of meal and flour, it inclines against us with regard to the cost of rearing beef and mutton. The British farmer can bring these latter to market at a lower rate than the Nova Scotian, and this he accomplishes by the mildness of the winter and the nature of the feed. The sheep both in Scotland, England, and Ireland, are allowed to range their native hills throughout the whole year, and to pick up a subsistence from the decayed herbage, heath, and wild plants, which are but seldom covered with snow. The cattle again are fed in the foldyard for not more than two or three months, and in the more temperate districts for less than the half of that time. The straw of white crops with a moderate supply of turnips is the species of fodder which supports them, and its principal value is always estimated by its conversion into manure. A heifer is usually taken for wintering at the rate of 20s.—a sum which here would not pay above the third of the hay which must be consumed during the long and dreary six months when our cattle must of necessity be shut up. If these data be correct, it would appear that the English farmer raises his meal and flour at a greater, and his meat at a less expense, than these can be respectively produced in Nova Scotia; and yet in order to reimburse his outlay, he requires a difference between them of double the price; whereas our farmer during the last year has been supplying the butcher, weight for weight, either at or below what he could obtain, for his bread corn. That region can never be destined by nature for pasturage, where the domesticated animal must be fed by hand for more than half of the year; and where, on account of the extraordinary quantity of hay needed, the very best lands must be devoted to their use. It is this capital mistake which has so long borne down the agricultural interest, and led our landholders to pursue that branch of rural economy, where

they will ever be attended with indigence and pecuniary embarrassment. The cost of rearing a pound of meat will always in this country be somewhat more than the half of producing the same weight of oatmeal and flour; and therefore the natural relation subsisting between the prices should be adjusted at a higher level correspondent to the capabilities of the climate.

If France and England, notwithstanding the temperateness of their winters and their superabundance of straw for fodder, require that meat be double the price of flour, it is perspicuously manifest that in Nova Scotia, beef, from the expense and trouble of raising it, should be elevated a little above that standard. What that proportion of rise should be is no easy matter to determine; yet the principle itself on which it depends is neither hidden nor uncontrovertible. In all the branches of a free trade, where labor and capital are not fettered by any impolitic or arbitrary restriction, they ought to have the same profit, and they will tend to this equality whenever men understand their own interest clearly. The remuneration derivable from an hundred pounds in live stock, should be equivalent to what the same amount yields in tillage; and therefore the prices of butcher-meat and bread should here assume a relation resulting from the greater or less expense of production.

These views strongly inculcate a lesson of practical utility that deserves to be earnestly taught and deeply studied. Our countrymen have persevered in the hay husbandry to the obvious disadvantage of themselves and of the community; and it is now high time that they be cured of the strange infatuation. They have been selling beef at a price much below its fair and natural level, and consequently drawing from their lands a return less by the one half than these could have yielded under arable management.

And I believe that our farmers are beginning to open their eyes to their true interests. The rage for grazing is gone by, and better and juster sentiments are succeeding in its room. Our peasantry are a shrewd and intelligent race, and will not fail, in the long run, to discover the best and most advantageous methods of employing their labor and capital. Their own calm reflections and their mutual reasonings are gradually removing the prejudices which clouded their understandings, and are enabling them to descry the respective benefits of pasturage and tillage. Since the origin of this Society, there has been a progressive increase of arable cultivation, and from present appearances it is not yet on the wane. Very considerable quantities of country flour have been weekly, I had almost said daily brought to Halifax during the last three months, and this event marks a new era in the records of our agriculture.

It will be recollected that when I had the honor of last addressing you in this place, I then stated, "that the prizes which had been offered for bringing a supply of flour to Halifax had baffled expectation, that three parcels only, amounting to 2 tons, 16 cwt. had come from the interior, and that it would be vain to continue those prizes, because our husbandry seemed to have reached that point in which it could about meet the internal consumption," "but had nothing to spare for the capital."—We are now advanced a step further; and with-

out the least encouragement from the Legislature, native flour has come in all this winter as regularly as the other articles of agricultural produce. What the whole quantity may have been, it is impossible to ascertain; we know, however, that it has been bought up as fast as it appeared, by merchants, bakers, and householders; and the supply is not yet stopped, but continues flowing with a steady current.

From some inquiries which I have made among the principal purchasers, there is evidence that about forty tons* have passed into their hands, besides the small parcels which have gone to housekeepers, and which could not be traced with any accuracy, but may be safely reckoned at ten more.

This town too is not the only place where native flour has been exposed for sale. Pictou is now trading in it to a great extent; and oatmeal and flour are received there by the merchants in payment of debts, and in the exchange of commodities. Even Liverpool, according to a late letter from the Secretary of its Agricultural Society, had gotten fifty barrels by the 22d January last, from Brookfield and Caledonia, where three years ago the settlers began to cut down the forest.

But though we have no means of reckoning the sum total of all the domestic flour raised by our farmers above their own immediate consumption, we can refer, with the view of casting some light on this subject, to the books of the Custom House, and learn whether our imports on the whole have been diminished in 1822. When we appeal to this testimony, the information is of a most gratifying and exhilarating description. In every article of agricultural produce there has been a signal reduction of imports during the last year, and in oats and barley we have obtained an export for the first time.

At the desire of his Excellency the Governor, an account of the Imports and Exports for the years 1818 and 1819 has been obtained from the Custom House in order to ascertain the agricultural state of the province before the existence of the Provincial Agricultural Society; but it is unnecessary minutely to go into all these particulars, as it would too much complicate the details now presented, to carry the comparison so far back. This Society began its operations in the spring of 1819, and can be supposed to have influenced but slightly the agricultural produce of that season. I shall just observe, that although the imports of both these years fall short of those of the succeeding, they swell greatly beyond those of 1822. In the first of those years we imported 51,095

* Since the date of this Report, March 12th, a regular weekly supply has continued to come in from the country, and the whole quantity, now April 1st, cannot be less than 50 tons, as one individual, Mr. Wm. Macara, has brought from his farm several tons. Eighty tons flour are equal to 914 barrels; and these being added to the imported stock on hand will, it is believed, meet the consumption of the town till the navigation of the St. Lawrence opens again the Canadian market in May. But if our agricultural improvement were to be calculated solely by the above quantity, we would run into an egregious blunder; for it is matter of observation and of fact that the sleds and waggons returning from the town are not, as formerly, loaded with foreign flour; and therefore our tillage is now equal to the wants of the country, and has in part arrested that destructive trade carried on by our farmers since the first settlement of Halifax.

barrels and 1181 half barrels of flour; and in 1819 the further amount of 50,716 bbls. 2013 half bbls. and 350 bags, with bread, wheat, Indian corn and meal in proportion.

These statements should suffice to banish all despondence about our future prospects, and to inspire an unhesitating confidence in the capabilities of a country, which has repaid our efforts with so much liberality. They should also have a due effect on the guardians of the public expenditure,—inasmuch as undoubted proofs are furnished that the former grants have neither been unprofitable nor misapplied, and that every shilling taken from the treasury has been a mean of lessening our imports, and of thus saving our circulating medium; to say nothing of the great addition made to the provincial wealth. To sum up the whole, I am inclined to believe, that in the history of domestic improvement, no parallel can be found to the prodigious advances we have made in the short space of four years; and that if the mechanism now in motion, by which this province is ascending so fast to independence in corn, be neither broken down nor materially clogged in its operations, we shall soon rise superior to all our difficulties.

JOHN YOUNG, *Secretary.*

Halifax, March 12th, 1823.

FOR THE NEW ENGLAND FARMER.

CATTLE SHEDS.

J. H. Farm, West Newbury, May 27.

MR. EDITOR,

I wish through your valuable paper to request a description of the best possible way of making a Cow House—as to the width; depth of the trench; space between each cow; whether to have partitions or not; how to fasten them; whether a rack is necessary or not; and every thing that is convenient or useful. I have for sometime calculated on making an alteration, and have taken pains to ascertain the best way, and thought I had a perfect plan; but unfortunately for my plan, I saw one possessing more conveniences the other day, which induced me to think if I made the inquiry through your paper, some of your many respectable patrons would be willing to give a description of those on their farms; or if theirs were in any way defective, to alter their descriptions to their present views, which will much oblige yours, &c.

ARATOR.

FOR THE NEW ENGLAND FARMER.

REMEDY AGAINST THE HESSIAN FLY.

MR. EDITOR,

SIR—Wheat is so important an article of food that every farmer should make all possible improvement in its cultivation. It is like the other precious things of this world, the more valuable, the more difficult to obtain. Many of our farmers in this quarter begin to despair of success in this crop for the present, in consequence of the ravages of the Hessian Fly the last season, which, they say will have its course and destroy our Wheat for several years, after which we may again venture to sow it. A neighbor of mine has lately informed me of a remedy, or rather a preventive to the effects of this destroyer, which to me is new, and may be so to others, and I therefore hasten to communicate it to you, knowing that if it be worthy

of notice you will give it publicity, and not otherwise.

My neighbor states that his brother, in an adjoining county, sowed a field of wheat the last season, which came up well and grew rapidly for a short time, when he discovered that the fly had laid claim to the whole field by depositing its eggs in the first joint of every stalk. Immediately on this he turned his sheep into the field, who soon cropped the whole to the ground, and after they were removed the wheat again grew rapidly, and from this field he harvested a remarkable fine crop of good wheat.

I leave this simple fact to the consideration of yourself and your subscribers.

Yours, respectfully,

B. Buckfield, Maine, May 20, 1823.

From the Massachusetts Agricultural Repository.

I do not expect to impart any thing new to the intelligent farmers of our country, but still as the crop of hay must ever be an important subject to the cultivator; and as the success of the following experiment was very gratifying, I am induced to submit it for publication. If it induces others to drain their low lands, and make them more productive, I shall reap much satisfaction therefrom.

I have on my farm a flat piece of low land, of about twenty acres. This has been to me, and to my predecessors of more than half a century, of less value than has been expended in mowing the alder and other bushes, which had overrun the ground. The difficulty of draining, for want of a sufficient descent, had discouraged any thing being done to effect any improvement. Although I had occasionally seen some instances of low land thrown into beds, by intersecting ditches, yet the universal practice of this mode of taking off the water, and producing forward vegetation on the banks of the St. Lawrence, and its apparent good effect, induced me to make the experiment. I accordingly, in a dry time, in the fall of the year 1814, broke up about four acres of this land. The soil was of a black meadow mould. The under stratum sand and clay mixed, making a hard pan. As the furrows turned over very smooth, except in some places where it was strong, the land was left till the next year, 1815. When it became sufficiently dry, the sod was found more rotted than was expected. About twelve bucks of manure to the acre were carted on and spread, and the harrow was, at different times, passed over the ground during the summer and fall of the year. The usual wetness of the soil had discouraged the expectation of raising any crop from the ground. In the latter part of the fall a large central ditch was opened through the whole piece, corresponding to the descent therefrom. Furrows were then ploughed at suitable distances, and the ground from them thrown upon the beds, which were made about 20 feet by 60. This admitted a more early ploughing in the summer of 1816. It was then laid down with herd's grass and clover seed. About half a bushel of the former, and four pounds of the latter to an acre. A few oats were sown therewith, which gave a common crop, and were cut for fodder. As the land had not been highly manured, and the experiment promised very favorably after taking off the oats, a coat of manure was put on, of about 12 bucks to the acre; and, it being an

object to prevent the evaporation of the manure (as this was done early in the dry season) as well as to have the land left smooth, and descending towards the ditches, they were ploughed anew, and the earth in them thrown upon the beds. In the spring of 1817, the grass made an appearance of most exuberant fertility; the herds' grass became very thick, and, before mowing, measured, much of it, over five feet. The clover was well set.

Several of my neighbors, thinking the crop greater than they had seen, wished to have the produce ascertained. I accordingly had three parts, or pieces, in no respect differing essentially, if at all, from the rest, measured by a careful surveyor, Major C. Adams, of Needham, and the crop therefrom was sent to the town's scale and weighed. The hay was perfectly well made, and the result was 16,152 square feet, equal to 59½ rods, produced 1 ton, 10 hundred, and 3 quarters of hay, equal to 4 tons, 2 hundred, 3 quarters, and 2 pounds to the acre.

I am, Sir, with much respect, yours, &c.

JOHN WELLES

From the American Farmer

TO TAKE HONEY.

MR. SKINNER,

There is a gentleman in the lower part of your native county, who knows much better how to take honey from bees than the German mentioned in your paper (No. 48, vol. 4,*) and with less expense than Blake's patent hives. I was once an eye-witness of his taking it, and partook of the nice dainty. He has no need of cap, mask or gloves—so far from shielding himself, he rolls his sleeves up above his elbows, and goes at it when the sun is at its meridian, knowing that the bees are all at that time from home. The brighter the sun the better, and the month of August is his honey harvest.—When he goes, as before mentioned, at mid-day, he takes off the top of the hives and takes out as much honey as he thinks proper; nails on the top and goes on to another, and another, until he is done. The honey is as nice and white as it can be. The bees will immediately fill up the vacant place, and the next year you have nice new honey again, as the gentleman informed me.

A LOVER OF HONEY.

May 11th, 1823.

* See N. E. Farmer, pp. 322 and 331.

WHEAT HARVEST.—Our accounts are various, but generally very unpromising. On both the south and north sides of the James River, for a considerable distance above this city, and for 20 miles below it, there has been much injury already done—at some places the fly alone, at others the chinch bug, and in some fields both insects are at work. We have heard that the bug has already attacked even some of the oats, and some spots of the young corn. The rich lands, even in this district, however, may produce good crops of wheat. On the lower parts of Pamunkey river and on to the Rappahannock, the crops as yet appear very fine. The chinch bug is certainly this year in extraordinary numbers—for within the last week many have been seen flying in our city, an object of curiosity rather than of dread. It is a small speckled fly, that derives its name from its smell when mashed between the fingers.—*Richmond Enquirer.*

From the London Farmers' Journal.

On feeding Sheep with Mangel Wurtzel.

Heredfordshire, Jan. 25, 1822.

SIR—It is rather unusual for a man to write on a subject which he professes to be totally ignorant of; and in addition to this, your correspondent Mr. Thorpe, in his letter of January 3d, seems disposed to doubt the veracity of one who has planted and used mangel wurtzel for several years past; however, it is done openly, and in an inoffensive manner, therefore I freely forgive him.

I have neither leisure nor inclination to enter into a controversy with Mr. T. but I deem it necessary to answer his letter of the 3d inst. and to repeat, for his satisfaction, if he pleases, that "I weighed five wether sheep, and put them into a barn, as stated in my letter of the 12th ult. and in that situation they were regularly supplied with 25 lbs. of mangel wurtzel, (less than three roots) and five lbs. of good hay during every 24 hours, for each sheep, and this continued for five successive weeks, at the expiration of which time they were weighed out, and had gained upon an average eight lbs. per quarter." It seems to strike Mr. T. with wonder, that animals should gain so much more than he states they would gain, when at grass in the month of May and the following months; but when it is considered that the sheep were penned up in a warm barn, and without the possibility of exercise, they were much on a footing with pigs in a sty, fed on barley meal and pease, or like unto turkeys, if crammed with the best Carolina rice. It is not at all extraordinary for animals having an aptitude to fatten, to make still greater progress when fed on such a sweet succulent root as mangel wurtzel, corrected with a little good hay. Mr. T. pleads his being a novice in the cultivation and general knowledge of the root; therefore, under such circumstances, it may be difficult for any one to convince him of its extraordinary properties; it is possessed of greater specific gravity than that valuable root, the Swede turnip. Perhaps Mr. T. is unacquainted with the fact, that during the reign of that enterprising man, Bonaparte, he passed a law, that all farmers in Flanders should set apart a portion of their farms for the cultivation of this root, for the purpose of making sugar, and which experiment more than equalled his most sanguine expectations. Good sugar was produced at one shilling per pound, when at the same time West India sugar was selling in France at five shillings per pound.* This circumstance will give Mr. T. some idea of the nutritious quality of the mangel wurtzel. With regard to the manner of cultivation, I must leave that to the able hand of your correspondent Mr. Addams, who has, I think, promised to give it to us in detail; but as the method I pursued last season may be additional information, I will briefly state it.—The land (a sandy soil) was prepared as for Swede turnips, good rotten dung placed in drills 18 inches distance in the rows, and my plants were full 12 inches apart; the seeds were planted the last week in April, not exceeding two inches under the surface, with a small planting stick, taking care not to put more than one pod (which contains more than one seed) in each

hole; the plants make their appearance in about 21 days; and when about the size of cabbage plants, care was taken that only one plant remained in a hole; they were kept clean by a single horse hoe in the rows, and hand weeding between the plants; after having had immense quantities of the large leaves taken from them during the last four months they were in the ground, they were pulled up about the end of November, (but this greatly depends on the season) and placed in heaps in the open ground and covered with straw and earth similar to potatoes; some I placed in an out-house, but I think it matters not which. What remained in the month of April following, were as fresh as when taken up; but what adds greatly to the value of this root is, that it is taken up in time to put in wheat, and the land is in very high tilth to receive it. It gives me pleasure, Mr. Editor, to be the means of drawing forth observations on the cultivation and use of a root that promises to be of incalculable value to the United Kingdom, provided we have equal protection with the trading and commercial interests.

I remain your well wisher.

From the American Farmer.

ON THE VARIOUS WAYS OF PREPARING AND EMPLOYING INDIAN CORN.

There are many things the rich have no need to think of, which would be of infinite advantage to the poor, if they had the knowledge necessary to turn that product of their labor they have most in their power, to their own comfort. You may perhaps smile when you perceive this preamble is to usher into notice the virtues of *Indian Corn*. I will allow you to do so, if you can find in my enumeration one use to which I put that valuable grain, worthy of being more generally known. In order to swell the list, I mention some of the purposes for which it is used, that are known to every one, before I enter into the detail of preparing a dish which I consider the best, healthiest, and most palatable food we have. I will begin with it before the seed is perfectly formed; it can then be made, if properly done, a *fine pickle*. We all know how delicious *roasting ears* are: when fit for this use it will make a superior *starch*; if scalded and dried you may have *roasting ears* in the middle of winter. When the grain is hardened, you have food for all the domestic animals in the shocks, tops, &c. The leaves of the shock or husk, by slitting them finely, make excellent *mattresses* or under beds. The flour or meal of the grain is the most wholesome we use; I need only mention a few of the ways in which it is managed in this state, for I should never have done were I only to give you the receipts for making the various kinds of corn bread common in this part of the country. A favorite way of making corn bread with us, is to make a batter with meal, milk, eggs, and a little shortening,* about the consistence of that for pound cake, which it resembles in appearance when baked in tins commonly used for that purpose. In making light bread by mixing the wheat flour and yeast with mush, we consider it adds much to the sweetness and wholesomeness of the bread; we likewise in all griddle cakes, mix meal with wheat flour as tending

to make them lighter, with fewer eggs than they would take with wheat flour alone—in short, we use corn meal on all occasions either with or without wheat flour—not because we have not flour sufficient, but because we prefer meal. I can assure my fair countrywomen they need not apply to quacks or perfumers, or (I forget what they call them.) I mean those foreigners who vend poisons, under the pretence of rendering those that use them more beautiful; and recommend them, because a few worn out old women have made out, by attending to nothing else but the application of various arts to hide their deformity for a short time, who having no beauty to endanger, cannot fear the consequences. I say those who do believe in the virtues of cosmetics will find my favorite corn meal superior to all the washes, de Maienton, &c. &c. It will render the skin smooth, transparent and white—and withal it is perfectly safe. Only let them try it instead of going to one of those vendors aforesaid, and spending two or three dollars for a nostrum, which at best will only be of transitory benefit, leaving a lasting ill effect; let them put over the fire a pint of water, when it boils stir in as much fine corn meal as will make it the consistence of paste—when cooling they may add a spoon full of honey and a little rose water, though the latter articles are not necessary—let them use this paste, or as I vulgarly call it, *mush*, instead of soap every time they perform their morning and evening ablutions, or, in other words, wash themselves. I venture to affirm their complexions will derive more advantage from the application of this paste, than any of those washes which they pay so high for.

I come now to the preparation of the grain, which I believe is not as generally known as it ought to be, considering its excellence. It is what we call *lyed hommony*; we likewise have the best *hommony* and *small-hommony*, both of which are common, are fine dishes, and superior to rice, when properly managed; but the *lyed hommony* is preferred by every one who is accustomed to it, as being more wholesome and more palatable. It is prepared by boiling the white field corn in ashes and water, until the husk or skin of the grain is loosened, which will be the case in a few minutes, and it is necessary to pay attention that it does not remain too long in the ashes, as it will by that means taste of the lye; so soon as the husk is loosened, it must be washed and rubbed through the hands in cold water until the grain is cleansed from the ashes and skin; it may then be dried or make use of at any time, or boiled immediately if wanted. When ready to be cooked for the table, it must be scalded and put over to boil in plenty of water, observing always to keep sufficient hot water ready to add to it as the first boils away. The grain bursts open into a white ball and becomes soft when sufficiently done. This is the manner we boil it to eat with milk or cream, either warm or cold. It is also used in this country by the Indians and Creole boatmen, who prefer it to any thing else in a soup, by putting the corn over with a piece of beef or pork, leaving the water in it which makes the soup—in the other case the grain is taken out of the water. A yankee acquaintance of mine who knew nothing of hommony, has become so fond of this dish as to declare *lyed hommony* and milk to be preferable

* See that entertaining work Radcliffe's Agriculture of Flanders.

* A word in Domestic Cookery which implies that butter, lard, or oil may be used.

the best sweet meats and cream that can be had, and I doubt not some there are who would sink the same, were they equally to make the trial. I have been induced to write the preceding.

A MISSOURI FARMER'S WIFE.

A GREAT CONVENIENCE FOR GOOD HOUSEWIVES.

Daniel Richardson, an ingenious and respectable mechanic, has brought to great perfection the REFRIGERATOR, or Portable Ice House. Good housewives can only calculate the many useful and economical purposes to which this contrivance may be applied. The improvements made by Mr. Richardson, have so far perfected the refrigerator, that it may now be fully relied upon for keeping butter, milk, meat, eggs, fruit, vegetables, or any article of household consumption, perfectly cool, fresh and pure. All the above named articles may be preserved in these machines as long as desirable, perfectly sweet, clean and free from taint. The Refrigerator may be deposited in the cellar, in the garret, in any part of the house, or even in the open air, without any perceptible injury to the contents; it does not require to be replenished with ice, more than once in three days, during the hottest season; and it is attended with another advantage—complete security against every species of vermin, to which it is totally inaccessible, and in winter it will keep any article from freezing, that is deposited in it. Every family ought to have one—the price is from 15 to \$25, according to size—and the manufactory is in East street, Baltimore.—*ibid.*

NEW ENGLAND FARMER.

SATURDAY, MAY 31, 1823.

The Farmer's and Gardener's Remembrancer.

JUNE.

FIELD CULTURE OF CABBAGES.—Mr. A. Young has observed that Cabbages “flourish to very great profit on all good soils, and have the particular property to enable the farmers of clays and wet loams, to winter more cattle than those of lighter lands can effect, by means of that excellent root, the turnip. The great evil of clay farms used to be the want of green winter food, which confined their stocks to hay alone, and consequently prevented their reaping those extended articles of profit that arise from numerous heads of cattle; and, besides the immediate benefit from the cattle, they lost also the opportunity of raising large quantities of dung, which can never be effected so well as by keeping cattle. But all these evils are by the cabbage culture remedied.” There is another advantage attending cabbages which make them highly eligible on all farms, which is their lasting for sheep food longer in the spring. Ruta baga, together with some sorts of cabbages, are in perfection in April, and last even to the latter part of May, the most pinching period of the year. Turnips, it is said, will not last so long.

The author of “Practical Agriculture” advises, that “as the roots of the plants run deep and stand in need of a large portion of nourishment, the soil should be well loosened to a good depth. As near as possible to the time of planting, the ground should be well harrowed over, and a suitable proportion of good stable manure applied, as from fifteen to twenty-three horse cart loads to the acre; or where composts are

made use of, from twenty to thirty.” We have been told by a gentleman, who says he speaks from experience, that ashes, lime, and plaster of paris, mixed with stable or other manure, and spread on land designed for cabbages, will prevent a disease in the plant called the fumble foot, in which the roots swell and become knobby, and the plant attains but a small and imperfect growth. Cabbages are said to grow well in drained swamps, without any manure. Hog manure is recommended by Dr. Deane, but we have been informed that it is apt to harbor insects and cause the fumble foot, unless it is mixed with lime or ashes.

Some drop the seeds in the hills where the cabbages are to grow, by which means they escape the trouble of transplanting, a process in which they are in some measure stunted.—Mr. Bordley relates an experiment, in which he “compared cabbages transplanted with others not once moved. The unmoved grew, and were better than the moved.” Dr. Deane, on the contrary, declares, “I have tried both ways, and on the whole I prefer transplanting.” Mr. Cobbett says, that “to have fine cabbages of any sort, they must be twice transplanted. First they should be taken from the seed bed, (where they have been sown in beds near to each other) and put out into fresh dug well broken ground, at six inches apart every way. This is called *pricking out*. By standing here about fifteen or twenty days, they get straight, and stand strong, erect, and have a strait and stout stem. Out of this plantation they come *all of a size*; the roots of all are in the same state, and they strike quicker into the ground where they stand for a crop.” The expense and trouble of this operation (even if there are no other objections to it) will probably prevent its general adoption in the United States. Rees’ Cyclopaedia informs that “another practice adopted by the late Mr. Bakewell, and since employed by other cultivators, by which the inconvenience of waiting for a suitable moist time for setting out the plants, and the danger of their not succeeding under other circumstances, are avoided, is that of drilling the seed in where the plants are to remain at the proper seasons, as April, May or June, and the following month.” We do not believe there would exist any necessity for transplanting cabbages, in order to make the stems “straight and stout,” according to Mr. Cobbett’s directions, if the plants were not originally sown too thick, or were properly thinned at an early period of their growth. An English writer says, “Much injury frequently arises to young cabbage plants from the seed being sown too thick; care should therefore be taken to have them properly thinned out whenever they come up in too thick a manner.”—Probably if the plants were sowed in the hills where they are intended to grow for a crop, and thinned out in due season, they would grow as straight and as stout as if they had been several times transplanted.

Mr. Francis Winship, of Brighton, Mass. in the year 1820, raised thirty-two tons and two hundred weight of cabbages from one acre of land. The following is his account of the mode of its culture:—“The land on which the cabbages grew, is the same on which the ploughing match took place in the year 1817, was cultivated with corn and potatoes in the year 1818, and with potatoes in the year 1819.—

This last spring it was ploughed once. In June it was ploughed again, and struck into furrows from $2\frac{1}{2}$ to 3 feet apart. I then dropped leached ashes into the furrows, one shovel full making 3 or 4 hills 15 or 20 inches apart; it was then mixed with the loam and covered; a boy followed with the seed, and penetrated the hill with his thumb and finger, and deposited three or four seeds. This was performed the latter part of June. They were afterwards weeded and thinned as convenience suited, probably equal to three dressings.”* This would have been called a large crop in England, where twenty-five tons to an acre is considered an average crop.

Although it might be as well, perhaps, to sow the seeds of cabbages where the plants are expected to obtain their growth, yet as transplanting them is most customary, and in some cases most expedient, it may not be amiss to give some observations on this mode of cultivating this vegetable. Mr. Cobbett has the following directions for conducting this process:

“Dig the plants up, that is, loosen the ground under them with a spade, to prevent their being stripped too much of their roots. The setting stick should be the upper part of a spade or shovel handle. The eye of the spade is the handle of the stick. From the bottom of the eye to the point of the stick should be about nine inches in length. The stick should not be *tapering*, but nearly of equal thickness all the way down to within an inch and an half of the point, where it must be tapered off to the point. If the wood be cut away all round to the thickness of a dollar, and iron put round in its stead, it makes a very complete tool. The iron becomes bright, and the earth does not adhere to it, as it does to wood. Having the plant in one hand, and the stick in the other, make a hole suitable to the root that it is to receive. Put in the root in such way as that the earth, when pressed in, will be on a level with the butt-ends of the lower, or outward leaves of the plant. Let the plant be rather higher than lower than this; for care must be taken not to put the plant so low as for the earth to fall, or be washed into the heart of the plant, nor even into the inside of the bottom leaves. The stem of a cabbage, and stems of all the cabbage kind, send out roots from all the parts of them that are put beneath the surface of the ground. It is good, therefore, to plant as deep as you can without injury to the leaves. The next consideration is the *fastening of the plant in the ground*. The hole is made deeper than the length of the root, but the root should not be bent at the point if it can be avoided. Then, while one hand holds the plant, with its root in the hole, the other hand applies the setting stick to the earth on one side of the hole, the stick being held in such a way as to form a sharp triangle with the plant. Then pushing the stick down so that its point go a little deeper than the point of the root, and giving it a little twist, it presses the earth against the point or bottom of the root. And thus all is safe, and the plant is sure to grow. The general, and almost universal fault is, that the planter, when he has put the root into the hole, draws the earth up against the upper part of the root, and if he press pretty well there, he thinks that the plant is well done. But it is the point of the root against

* Mass. Agricultural Repository, vol. vi, p. 257.

which the earth ought to be pressed, for there the fibres are; and if they do not *touch the earth closely*, the plant will not thrive. To know whether you have fastened the plant well in the ground, take the tip of one of the leaves of the plant between your finger and thumb; give a pull; if the plant resist the pull so far as for the bit of leaf to come away, the plant is properly fastened in the ground; but, if the pull bring up the plant, then you may be sure that the planting is not well done. The point of the stick ought to twist and press the earth up close to the *point of the root*; so that there be no hollow there. Pressing the earth against the *stem* of the plant is of little use.* The same writer directs to "choose a dry time for your transplanting, for this reason; if your plants are put into wet ground, the setting stick squeezes the earth up against the earth in a *mortar like state*; the sun comes and bakes this mortar into a hard glazed clod; the hole also, made with the stick is smooth upon its sides, and presents an impenetrable substance to the roots and fibres of the plant, and thus the vegetation is greatly checked; but when plants are set in dry earth the reverse of all this is true, and the fresh earth will supply moisture under any degree of drought."

In procuring seed for raising young cabbage plants, great care should be taken that it be obtained from the most perfect plants of the different kinds, and such as have seeded without any other variety of the same tribe blowing near them. The plants intended for seed should therefore be set out by themselves, at a distance from others. New seed should be preferred, as it vegetates quicker, and is more to be depended on.

Cabbage plants are very liable to be attacked by insects. The grub, or black worm, in the night, eats off the stalks just above the ground, and buries itself in the soil as soon as the sun rises. Dr. Deane says a little circle of lime, or rock-weed round the plant, will preserve them, and recommends digging for the worm near the place which shews the marks of its ravages, and destroying it. Some recommend whipping the plant with green elder bushes. Scalding the hills, and then enclosing them with boards, bark or shingles, would be an effectual but a troublesome mode of securing the plants. The *Economical Journal of France* gives the following method, which it states is infallible, to guard not only against caterpillars, but all other insects which infest cabbages or other vegetables. "Sow with hemp all the borders of the ground where the cabbage is planted; and, although the neighborhood be infested with caterpillars, the space enclosed by the hemp will be perfectly free, and not one of the vermin will approach it." A gentleman told us that he preserved his cabbage plants perfectly free from worms, bugs and flies, by dibbling small holes in the ground near the plants and tilling the holes with water which had been poured boiling hot on elder leaves and suffered to stand till cool. If this is always effectual, nothing cheaper or easier of application can be devised. The following is recommended by a foreign journal. "Take a pound and three quarters of soap, the same quantity of flowers of sulphur, two pounds of pul balls, and fifteen gallons of water. When the whole has been

well mixed, by the aid of a gentle heat, sprinkle the insects with the liquor, and it will instantly kill them. Salt, sowed over the ground in moderate quantities, will destroy insects and prove beneficial to vegetation. Too much salt will injure vegetation and render the ground barren for several seasons, and so will *too great a quantity of dung*, or almost any other manure. Sir John Sinclair says that salt in small quantities is useful as a preventive against insects; and it was ascertained by a series of experiments by the Rev. Dr. Cartwright, detailed in communications to the Board of Agriculture, that a mixture of salt and soot was preferable to any other manure. Eight bushels to an acre has been applied in England on sour rushy land with a beneficial effect. One half that quantity would probably be sufficient in most cases, and we have no doubt would prove an effectual antidote against insects of all kinds.

CLEANSE YOUR CELLARS.—If you wish to live out half your days, be careful not to be in the habit of breathing the gasses of putrefaction, vegetable or animal. We do not pretend to say whether a parcel of rotten and rotting potatoes, cabbages, turnips, and other vegetables, decaying in a cellar will produce what is called *yellow fever* or not. But a kind of fever may be manufactured from vegetable or animal putrefaction, which may prove as fatal, though perhaps not quite so rapid in its progress, as the genuine plague of the West Indies, or the Levant. Beef brine, or pork brine, suffered to stand too long, becomes very offensive, and whatever offends the sense of smelling is injurious to the health. We have been assured by physicians of eminence, that they have every reason for believing that bilious or typhus fevers of a malignant and fatal kind, have originated from sources of this description. Dead rats or mice, in a wall or ceiling, are detrimental to health, as well as offensive. We very much doubt whether any thing effectual can be done to counteract the effects of their effluvia, unless the substances themselves can be come at, and removed. The following has been recommended as an effectual mode of freeing a room from the offensive smell occasioned by a dead rat or other animal:—"Take a small earthen vessel or gallipot, into which put a little salt petre, more or less according to the size of the room; pour upon this a sufficient quantity of sulphuric acid [oil of vitriol] so as completely to saturate it, and shut the room up closely for an hour, in which time it will be found to be perfectly free from the offensive smell."

Dr. Thomas Cooper gives the following directions for purifying apartments of noxious air: "Some common spirit of salt may be kept in one bottle, and some manganese in another; the manganese may be strewed on a plate or large saucer, and this may be placed over boiling water, a chafing dish of coals, or a small lamp; the spirit of salt may be poured on the manganese, when the chlorine gas will be extricated by the heat. It will be prudent to go out of the room and avoid the fumes, which bring on very obstinate coughing. After a short time, the room may be ventilated, and then washed, and white washed."

COL. JAKES' BREED OF CATTLE.

In our paper of the 19th ult. p. 302, we took some notice of the *improved breed of cattle*, own-

ed by Col. Jaques, of Charlestown, and the sale of a bull, which formerly belonged to that gentleman, to the Montreal Agricultural Society for the sum of \$300. The Canadian Courant of the 3d inst. has copied the notice alluded to and accompanied its insertion with the following remarks, which shew that the introduction of that species of stock into Canada is considered as an acquisition to the Province.

"The attention which is paid to select the best breed of stock, wherever they can be found will render very great advantage to the country; it is true neat cattle are plentiful, but they are very light, and a small ox requires the same care to raise and fat as a large one, but cannot yield the same profit. Therefore it is but justice to remark that the efforts of our Agricultural Society to import so fine a Bull of the short-horn or Teeswater stock, with a view to improve our breed of cattle, deserve great commendation. Time has demonstrated that the farmers must turn their attention to raising of good stock, and give up the idea of a continued aration. If a view is taken of the article imported into this Province, which can be furnished by the farmers, it will be perceived that the most profitable part of farming is engrossed by the Americans, the duration of which depends on our own exertions."

Since writing the above, we have seen an article in the same paper of the 10th inst. setting forth the good qualities of this breed of cattle, from which we extract the following:

"This animal has by far exceeded in appearance, and apparently good qualities, any expectation of them that could have been anticipated and as it may afford some gratification to those who feel an interest in the object contemplated by his introduction into the country, to be made acquainted with his pedigree, they offer the following as a statement of it, which they believe, from the most particular inquiry, to be perfectly correct.

"Eclipse was sired by the full blooded English bull Cœlebs, the property of Samuel Jaques Esq. and is out of the English cow Flora, both of which were imported from England, when young, by Cornelius Coolidge, Esq. in 1818.

Eclipse was calved 3d July, 1821; he is the third calf from Flora, and obtained the first premium from the Massachusetts Agricultural Society, at the Brighton Show, in October last, then only 15 months old, and weighed 1243 lbs.

Cœlebs is a direct descendant from the first blood in England; his grandsire was the famous bull "Comet," that was sold at the public sale of Charles Collings, Esq. at Ketton, in 1810, six years old, for 1000 guineas; his sire the "Hercules," from a first rate Holderness Cow* of Mr. Mason's, of Darlington; his grandame from Sir H. Vane's stock; his dame got by the noted bull Wellington, the property of Mr. Collings."

The breed is remarkable for its mildness of temper, and possesses the three most desirable qualities, viz. in affording the greatest quantity of Beef, Tallow and Milk.

*The Holderness breed is celebrated for giving a great quantity of Milk, and the cows generally give from 24 to 36 quarts per day.—*Rees' Cyclopaedia*.

Col. Jaques has still on hand, for sale or to let, at his residence in Charlestown, three half-blooded bulls, one year old this month, from first rate native cows, sired by Cœlebs.

* American Gardener, par. 261

LONG WOOLLED SHEEP.

Four fine ewe *Sheep*, of the long woolled breed, milar to the Bakewell, Dishley, or Leicester breed, have lately been imported from the Netherlands, by Capt. David Low, of Boston, and are now owned by Col. Jaques, of Charlestown. Sheep of this kind are highly valued in Europe for their heavy carcasses for mutton, and the length and excellent qualities of their fleeces, which are absolutely indispensable for the production of worsted manufactures. They are of the same sort with those imported by the Hon. Thomas H. Perkins, for which that gentleman received a premium at the last Cattle Show at Brighton.

HESSIAN FLY.

The remedy for the Hessian Fly, suggested by our correspondent B, page 347, of this day's paper, deserves attention, and repeated experiment. It has been tried in the Southern States, and we believe without success. A writer in the American Farmer, vol. ii, p. 127, says, "I am of opinion that the fly deposits in the central blade in a few days or hours after the wheat comes up, and is surely moored in its fast hold before the wheat would bear grazing; and that they continue to deposit as long as they live I have no doubt. In our section of the country, wheat, if attacked by the fly, evidently declines at the time the blades make their appearance. This idea he correct, grazing can have no other than a destructive tendency. I am not acquainted with any stock, except sheep or horses, that can bite a blade of wheat at that early stage of its growth below the egg of the fly; nor do I believe that grazing would in the least insure any benefit, if every blade in the field could be swallowed, with all the eggs on them, unless the stock were so fortunate as to take into their mouths at the same time, all the eggs at work."

Dr. Isaac Chapman, in a communication read before the Agricultural Society of Bucks County, Penn. says that there are two generations of these flies. The first lay their eggs the latter part of April and beginning of May; and the second generation lay their eggs the latter part of August, and in September to the 20th. The wheat, by being cropped, or bitten close autumn, should escape the fly during that season, it might, notwithstanding, suffer in the ring, unless the cropping was continued till the fly disappeared. And it is to be feared that much cropping would weaken the plants to such a degree that the remedy would prove as bad as the disease. Still, if experiments in Maine have proved the utility of grazing wheat and as a security against the fly, the practice could be continued; for fact should prevail over theory. We have always understood that the best remedies against the fly are rich and well manured soil, and top dressings of soot, ashes, plaster, &c. which, by giving a rapid growth to the wheat, soon put it out of the way of the insect.

Parsnips may be raised to great advantage as a second crop to peas; the seed to be sowed when the peas are in. The writer of this has been in this practice for several years, and has generally found the crop of parsnips thus raised quite as large, and frequently larger, than those raised in beds by themselves. The parsnips select them from the sun when small.—*Commun'd.*

MASSACHUSETTS LEGISLATURE.

The Legislature of this Commonwealth assembled at the State House in this city on Wednesday. The Hon. Nathaniel Silsbee, of Salem, was elected President of the Senate, and William C. Jarvis, Esq. of Pittsfield, Speaker of the House of Representatives. The Governor and Lieut. Governor, together with the Council and the two branches of the Legislature, were escorted in procession to the Old South by the Independent Cadets, under Lieut. Col. Otis, where the annual Election Sermon was preached by the Rev. Dr. Thayer, of Lancaster. After the exercises at the Meeting House were concluded, the procession returned to the State House, and the two branches adjourned. On Thursday the votes for Governor and Lieut. Governor were counted, and were for the Hon. Wm. Estlin 34,402; Hon. H. G. Otis 30,171; scattering 754. The votes for Lieut. Governor were about the same with those for Governor, and the Hon. LEVI LINCOLN was elected by about the same majority. Both Houses adjourned at an early hour, in consequence of the death of the Hon. John Phillips, a Senator from Suffolk.

FOREIGN.

It is almost as difficult to extract truth from the mass of matter with which we are presented in our imported and manufactured journals, as it would be to obtain sunbeams from cucumbers, according to the recipe of Swift. The French despatches represent that the progress of the invaders is scarcely interrupted by a show of opposition; but by what we can learn from other sources, we are led to conclude that the French meet with very serious losses in their progress. In the first attack of the French on the fortress of St. Sebastian, the soldiers are said to have distinguished themselves to such a degree, that the Duke d'Angouleme distributed crosses of honor to them with his own hands. The Spaniards having observed them from their fort, ordered forward a 24 pounder, but they were so slow in mounting it that the Duke had time to leave the ground. When fired off the ball passed thro' a house and struck a platoon precisely on the spot where the Duke had been distributing his decorations, and killed and wounded fifteen men.

Portable Army Mill.—Baron Cagniard de Latour, who has already made some interesting discoveries in physics and mechanics, has exhibited to the King of France a Portable Army Mill, which, though it weighs no more than eight pounds, and hardly requires a moment to put it in motion, will grind in the course of the day, grain enough to feed about a hundred men.

New Hampshire Celebration.—On Wednesday, the 21st inst. the second Centennial Anniversary of the first settlement of New Hampshire was celebrated in a splendid style at Portsmouth. Prayers were offered by the Rev. President Tyler, of Dartmouth University. An Oration by Nathaniel A. Haven, Jr. Esq. was delivered; and a Poem, by O. W. B. Peabody, Esq.—These performances, we are told, were elegant, chaste, classical, and replete with information. An elegant and convivial entertainment was given at Wildes' tavern; and in the evening was the most splendid ball ever witnessed in that place. Judge Story, of this town, Hon. Mr. Webster, of Boston, and many other eminent characters, both of New Hampshire and other states, were present at this celebration, which calls up the memory of our heroic and worthy ancestors.

Salem Gaz.

The donations to benevolent societies in our country the last year, were between two and three hundred thousand dollars. Of this sum \$59,000 were received by the American Board for Foreign Missions; and 17 thousand by the American Education Society.

Mineral Spring.—We learn that a mineral spring has lately come into notice, which is situated in Bradford, East Parish, Mass. about a mile from the Merrimac Academy. The waters of this spring are evidently impregnated with iron and sulphur, and have given considerable relief in cutaneous eruptions and bowel complaints.

Astonishing Accumulation.—In England, a pound of crude iron costs a half penny; it is converted into steel, that steel is made into watch springs, every one of which is sold for a half guinea, and weighs only the tenth of a grain; after deducting for waste, there are in a pound 7000 grains—it therefore affords steel for 70,000 watch springs, the value of which, at half a guinea each, is thirty-five thousand guineas.

Of the numbers of the N. E. Farmer already published, only forty sets remain on hand, and they are daily called for. Those, therefore, who wish for the first volume complete, must apply immediately. May 24.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the Publisher) until arrearages are paid.

Complete files from the commencement of the paper in August can be furnished.

Agents who procure seven subscribers, and become responsible for the payment, will be entitled to a copy gratis, and in the same proportion for a larger number.

ODE TO INNOCENCE.

'Twas when the slow declining ray
 Had ting'd the cloud with evening gold;
 No warbler pour'd the melting lay,
 No sound disturb'd the sleeping fold.

When by a murmur'ing rill reclin'd,
 Sat wrapt in thought a wand'ring swan;
 Calm peace compos'd his musing mind,
 And thus he rais'd the flowing strain:

"Hail, Innocence! celestial maid!
 What joys thy blushing charms reveal!
 Sweet as the arbour's cooling shade,
 And milder than the vernal gale.

"On thee attends a radiant choir,
 Soft smiling peace, and downy rest;
 With love, that prompts the warbling lyre,
 And hope, that soothes the throbbing breast.

"Grant, Heavenly Power, thy peaceful sway
 May still my ruder thoughts control;
 Thy hand to point my dubious way,
 Thy voice to soothe the melting soul.

"Far in the shady sweet retreat,
 Let thought beguile the ling'ring hour;
 Let quiet court the mossy seat,
 And twining olives form the bow'r.

"Let dove-eyed peace her wreath bestow,
 And oft sit list'ning in the dale,
 While night's sweet warbler from the bough
 Tells to the grove her plaintive tale.

"Soft as in Delia's snowy breast,
 Let each consenting passion move;
 Let angels watch its silent rest,
 And all its blissful dreams be love!"

From the Charleston Courier.

THE SPANIEL AND THE MILLER'S DAUGHTER.

The only daughter of a wealthy Miller of Spoletto, while playing with a large Spaniel, fell into the Tiber without the accident being perceived. The dog jumped immediately into the water—reached the little girl, and seizing her strongly by her garments, strove to bring her ashore; but her dress was too weak, and yielding to the water, the courageous dog was obliged to abandon his prize.

Unable to succeed in an effort beyond his power, the desolate creature ran immediately to his master. Unfortunate man! he was yet ignorant of his calamity. The dog informs him of it by the most intelligent sign. Guided by a species of reason, he bore in his mouth the bonnet of his little mistress, and laid it with most piteous cries at the feet of his master.—The wretched father, overwhelmed with awful presentiments, exclaimed, at the distressing sight, "Alas! my daughter." Not, however, losing presence of mind at the calamity which his mute interpreter had so eloquently revealed, he rushed to the bank of the river and threw himself precipitately into the stream. The faithful dog accompanies and guides him the distance of several hundred yards. Prodigious power of instinct! Singular and happy preservation! The Miller, once more a father, has again in his arms his beloved child, already carried far by the progress of the waves. She is rescued from death almost at the moment of expiring. Having reached the mill, with the father carrying the child in his arms, the Spaniel exhibited an equal anxiety with his master for the fate of the girl; and when he saw her

restored to life, he fawned upon her with caresses and joy. From that time he followed her always, and regarded her with a look of content, which indicated that this sensible animal rejoiced in the benefits it had afforded.

From the Baltimore Federal Gazette.

BEG BUG SOCIETY.

At the last annual meeting of the "Female Society for the extirpation of Bed Bugs, and for ameliorating the condition of those who are interested with them," held on the 5th inst. at the sign of the Buggaboo, Mrs. Priscilla Pillow was called to the chair, and Miss Sally Scratch was appointed Secretary pro tem. The annual report was then read—

When on motion of Mrs. Sackingbottom, that the society do now proceed to the election of officers for the ensuing year, seconded by Miss Betsey Bedcord, the business was entered upon forthwith, and on counting the ballots it appeared that the following officers were duly elected:

Mrs. Rachel Ratsbane, President,	
Mrs. Bridget Bedpest,	} Vice Presidents,
Miss Susanna Sheets,	
Miss Charity Coverlid, Cor. Secretary,	
Miss Sally Scratch, Rec. Secretary,	
Mrs. Rose Bloodgood, Treasurer.	

MANAGERS.

Mrs. Priscilla Pillow,
 Mrs. C. Sublimate,
 Mrs. Lovey Whiskey,
 Miss Tacy Torpentine,
 Susan Soapit,
 Hannah Brush,
 Harriet Huntin,
 Dorothy Drownem.
 Patience Pinchem,
 Mary Mashem,
 Prudence Stopem,
 Ruth Rotem.

On motion of Miss Maria Mite,

Resolved, On account of the multiplicity of business which the members have on hand, in consequence of belonging to so many useful societies, that the Monthly and Quarterly meetings of the Board be dispensed with.

After some desultory conversation on a *very delicate subject*, which it would be improper to publish, it was

Resolved, That in order to *keep peace at home*, the Treasurer be authorised to offer a premium of one hundred cents, for the best model of a machine for Darning Stockings, which may render the superintendence of the ladies of the family, both old and young, unnecessary, to be decided on at the next annual meeting.

SALLY SCRATCH, Rec. Sec.

The common method of drawing cylindrical wire, consists in forcing the metal through circular openings in plates of iron, steel, or some other metal; but it is soon observable that the hole gets worn or deformed, and that the wire then ceases to have the desired regularity. Mr. Brookendon, of London, has nearly remedied this inconvenience by passing the metallic thread through conical holes made in diamonds, rubies, sapphires, or other hard gems. It appears to be unimportant whether the wire be introduced at the large or the small opening of the conical hole, but the best results, upon the whole, are obtained when the wire is entered by the smaller base, and drawn through the larger one.

LAST WEEK'S OMISSIONS.

Imported Bull.—The ship Magnet lately arrived at New York, has brought out a yearling bull of the short horned Durham breed. This animal was bred by Mr. Smith, of Dishley, Leicestershire, is descended from the celebrated bull Comet, sold in the year 1810, for one thousand guineas, and belongs to Mr. J. Brientnal of Woodbridge, N. J. This bull is of the same stock from which originated the bulls Denton, owned by Stephen Williams, Esq. of Northborough, and Coeleb belonging to Col. Jaques, of Charlestown.

Indian Corn preserved from Crows.—An experienced farmer in Connecticut states that pieces of cloth dipped in sulphur and grease, and placed upon poles about every 10 or 12 rods, through a piece of corn, will effectually secure it from the ravages of crows. He has practised this method with success the last seven years.

Hessian Fly.—The National Intelligencer states that this insect has made great ravages in the wheat field in the counties of Frederick and Shenandoah, Va.

Commodore Porter has addressed a letter to the Editor of the N. York Evening Post, complaining of abuses in the newspapers, and declaring that there have been no piracies committed since his arrival on the coast, and that our commerce has been effectually protected by his squadron.

The Robert Fulton, arrived at Charleston, from Havana, brings dates to May 7. Every thing was quiet there. Com. Porter had visited Havana, but was not noticed, in any way, by the authorities.

Prize Question.—The Duke of Holstein Oldenberg has authorized the Medical College of Oldenberg to award the prize of 200 Holstein ducats for the best answers relative to the causes of yellow fever; whether in the United States it resembles that of the tropic climates; whether it is a specific disease, endemic, sporadic, contagious, and other points connected with its origin and results. The advertisement appears in the Philadelphia National Gazette. Dissertations to be transmitted to George Frick, Esq. Baltimore, a will be received at Oldenberg prior to the 1st day Oct. 1824.

Lightning.—On the night of the 8th inst. the dwelling house of Mr. George Miller, of Lyme, Conn. was struck with lightning and entirely consumed. Mr. his wife, and one other person were asleep at the time (about 11 o'clock,) and barely escaped, taking with them the beds on which they were sleeping.

Mr. Sheldon Clark, of Oxford, has recently presented to Yale College the sum of \$5000. This is the largest sum ever given to that Institution by any individual.

Rohberies and Murders.—The inhabitants of the southern section of Norfolk County, Vir. have been tremely harassed by runaway negroes, who hide themselves in forests, swamps, and other places difficult access, and shoot the citizens while attending to their rural occupations. They have thus murdered several individuals. The militia have lately been ordered to patrol the woodlands and swamps in pursuit of the banditti.

Extraordinary Haul.—Some men who were engaged in fishing for shad in the river Delaware, opposite Ticum Island, drew up one hundred and eleven sturgeon at one haul. These sturgeon (says the N. York Spectator,) probably made a mistake in their geography, and mistook the Delaware for the Hudson, and Philadelphia for Albany.

The celebrated Mr. Roscoe, of Liverpool, has recently published a valuable work on Penal Jurisprudence, in which he mentions that he has drawn liberally on American sources of information, and enumerates them. An interesting correspondence with W. Tudor, Esq. of Boston, is contained in the Appendix.

A great fire has taken place at Constantinople, the quarters inhabited by the Christians, including immense warehouses of the Franks, which are called the Treasure of the East, were a prey to an ocean of flames. A great number of Christians, of all sects, were cruelly massacred by the Janissaries and the Mussulman populace.

FACTS AND OBSERVATIONS RELATING TO AGRICULTURE & DOMESTIC ECONOMY

BY THE EDITOR.

ON FARMS, FARM HOUSES, WATER, BARNS, &c.

The sacrifices of the ancient Romans, shew how attentive they were even in the choice of the ground they encamped on; much more were they so in that of the situation and nature of the place where they laid the foundation of their lasting buildings. They examined the waters of cattle fed on the spot, when they offered them in sacrifice; and if these were livid or corrupted, they offered others, as the unwholeness of the first might be owing to some usual distemper; but if they were often found to be morbid, they concluded that the air, water, or food, which the place yielded, would have a like effect on human bodies, and therefore speedily left that ground to search for a better situation. If, after repeated trials, they found the livers good, they judged the air and food to be so likewise, and settled accordingly. It is said that the good effects of those precautions may be still observed in the healthy situations of the remains of Roman encampments; they preferred health to every other consideration.

The Romans had pleasure as well as profit in view, when they bought or stocked a farm; and therefore they laid it down as a rule, *that degree of fertility should tempt a man to purchase in an unhealthy country.* "Buy not too stily," said the wise Cato, "but view again the purchase you intend to make; if it be a good one, the oftener you see it, the better it will please you. Examine how the neighboring inhabitants fare. Let the country lie in be a good one; the ways to and from it good; and the air temperate. Let your field, if you can choose your situation, be at the foot of a hill facing the south, in a healthy situation, where a sufficiency of laborers, of cattle, and of water may be had. Let it be near a flourishing town, the sea, or a navigable river; bordering on a good and well frequented road. Let the buildings on your grounds be strong and substantial. Do not rashly condemn the methods of others. It is best to purchase from a good husbandman and a good improver."

Open places and campaign countries are judged to be healthy, where the soil is dry, not enriched or sandy, where wild thyme and other aromatic plants grow spontaneously, and which are not otherwise bare, but interspersed with trees for shade. A ruddy complexion, clear bite of the eye, quick hearing, and distinct voice, are set down by Palladius as marks of a place where these circumstances are met with in the generality of the inhabitants.

That water is known to be wholesome which is free from mineral in it, is perfectly clear, has no taste or smell, deposits no slimy sediment, leaves no spots or incrustation when boiled in copper or brass vessels, and which boils peas, beans, &c. soft in a short time. "Rain water," says Sir Thomas Elliot, in his *Castle of Health*, is the most subtle and pure of any other wa-

ter. The next is that which issueth out of a spring facing the east, and passeth swiftly among great stones or rocks. The third is of a clear river which runneth on hard pebbles and stones. There be divers means to try which is the best water; for that which is lightest in poise or weight is best; also that which will soonest be hot; also that whereof cometh the least scum or froth when it doth boil. Moreover, dip linen cloths in sundry waters, and afterwards lay them to dry, and that which is soonest dry, the water wherein it was dipped is the most subtle."

Light waters, other things being equal, are the best, purest, and wholesomest. That water is accounted best and wholesomest, which is not only the lightest and freest from earthy sediment, but that which is most spiritous. And these properties are usually found in pure rain water, which being naturally distilled from the ocean and rivers, or by the heat of the sun raised into the atmosphere from whence it is returned much after the manner of common distillation. If any mineral substance is mixed with the water it is not fit for the farmer's use. If it be hard, it is thereby rendered unfit for washing, and some other kitchen uses. This is the kind of water which gives flesh boiled in it a red color. But even the hardest water may be easily rendered perfectly soft and fit for any use, by mixing it with a small proportion of potash, soda, or for want of these the ashes of any burnt vegetables.

When water is tainted by animal or vegetable substances being mixed with it, the noxious qualities may be carried off by boiling, during which the putrid particles evaporate, and whatever else remains will subside when the water cools. Or it may be corrected by mixing with it acids, such as vinegar, juice of sour fruits, &c.

M. de la Hire observes in the *Memoirs of the Academy of Sciences*, that rain water, which has been purified by passing thro' clean sand, and is afterwards collected in subterranean reservoirs, will keep a long time without becoming putrid. He thinks this the best water that can be made use of either for drinking or for other economical purposes, because it is not impregnated with any mineral, as spring waters sometimes are. The only thing requisite in the construction of such reservoirs or cisterns is to have a place which will hold water, made of such materials as will not communicate any bad taste to the water, which is to remain there a considerable time.* The first water, which falls from the roofs of houses, when it begins to rain should be thrown away, as having served only to wash the roof, which in dry weather is always covered with dung of birds and other filth. He rejects snow water for the same reason, and likewise the water of rain brought by winds, which pass over places infected with ill smells, as large cities, sinks, &c.

Columella, who appears to have been very much of a gentleman farmer, and therefore solicitous for the accommodation and comfort of ladies, says "the farm house should be some-

what elegant, in order to allure the wife to take delight in it." Comfort, convenience, cheapness of construction and durability, are, however, the things chiefly to be consulted in erecting a farm house. No farmer, who has not a large capital, should begin with building a costly house, unless he wishes to see it sold at a sheriff's auction. His house, barns, &c. should be as near the centre of his farm as possible. If these are placed in the corner of a large farm, a part of the land will be liable to be neglected, less manure will be sent to it, and the expense of cultivation will be greatly increased, in consequence of the waste of time and labor of men and working animals in going backwards and forwards over the estate. This general rule should hardly be dispensed with, unless such circumstances as the impossibility of procuring good water, or the want of a good building spot, should require some deviations. When the case will admit, the farm house, barn, &c. should front the south, be sheltered from northerly winds, and the barn yard should enjoy the benefit of the rising sun in the winter.—The farmstead should be placed on ground a little elevated above the farm in general. This is not only more healthy, but carts will bring home the grain and other products of the field with less waste when proceeding over land a little ascending. The manure from the farm yard will be conveyed down hill to the fields in the most cheap and expeditious manner; and what wash or drainings from the yards are suffered to escape, (which should be as little as possible) may be disposed of to better advantage than from a yard situated in a low corner of the farm, where perhaps they serve to manure the highway or a neighboring brook. Besides, when the house is built in an elevated situation the farmer may have a chance to see what is going on all around him.

There is something so pleasing in the appearance of neatness and cleanliness about a dwelling house, that even a stranger, transiently passing by, cannot help being prepossessed with a favorable opinion of those within. He passes along with the idea fixed in his mind of prosperity and happiness presiding within those walls. How different the sensation felt on viewing a contrary scene:—a house dismal and dirty, the doors and walls surrounded and bespattered with filth of all denominations, and fragments of broken dishes and dirty dairy utensils scattered in all directions impress on his mind the idea of misery and mismanagement.

It adds greatly to the beauty and neatness of a dwelling house to have a little plat of garden ground or shrubbery before it. This not only contributes to keep every thing neat and clean in front, but is often more easily managed than a garden behind the house.

It is a common practice, and with many a general rule, to build the farm house adjoining, and perhaps in contact with the sheds, barns, and other out houses. When the buildings are thus all situated in one clump, if one takes fire the whole will probably be consumed. Besides it is disagreeable and unwholesome to live too near manure heaps, and as it were in the midst

* For observations on the construction of cisterns, see p. 204, of the *N. E. Farmer*.

of your herds of cattle and swine. The barn should therefore be placed at a convenient distance from the dwelling house and other buildings; but as near as may be without danger of fire. Too low a spot will be miry in spring and fall. Too high an eminence will be inconvenient for drawing in loads, and on account of saving and making manures. If other circumstances permit, it may be best to place a barn in such a manner as to defend the dwelling house from the force of the coldest winds.

FOR THE NEW ENGLAND FARMER.

DURABILITY OF TIMBER.

In No. 39 of your paper, I published the remarks of two respectable characters of great experience, relative to the duration of timber; and will now relate my own observations.

In June, 1790, I built the first saw mill in this place; the timber was all white oak, and most of it fell and hewed in the month of February, when hard frozen. The millwrights came in June and altered my plan of the frame, and hewed some long timbers of white oak when the bark peeled. The saw mill stood firm for twelve years; then the timbers fell in June began to fail, and in fourteen years were perfectly rotten, and the frame beginning to fall. In 1816 it was all pulled away, and a new mill built in the place. Many of the timbers that had been fell in February were perfectly sound and made use of. I observed that all such had been young thrifty timber, of large growths; and pieces of brush wood, and small growths had become dotted and rotten in 26 years; and so far as respects white oak timber, I am fully satisfied that Alexander Brown's theory, as mentioned in No. 39, is perfectly correct.

The same rule will not hold good in regard to some other kinds of timber, more particularly *Hemlock* and *Hickory*, in which I have made some observations. In the year 1790, I was anxious to hire hands to cut and peel hemlock logs for a log barn in the fore part of summer, before the bark set fast, but was advised by an old man from Rhode Island, to adjourn cutting such logs until the bark would again peel in the month of October, with the fall of the sap; then, he said, *the logs would last forever*. I had no experience in hemlock timber, and took his advice. The logs were cut, peeled, and the barn raised in October; and, as yet, the logs appear as sound as when they were first raised, and show no disposition to rot. Some years since I built a house of hemlock logs, cut in midsummer, when the bark would not peel, and the logs rotted in a few years.

In the year 1797, I built a house of hemlock logs, cut and peeled in the month of June. It is yet standing, but the logs much rotten.

White pine timber should be felled in the winter, when hardest frozen, and the bark hewed off; then the sap part of such logs will remain white and sound several years. If the bark is left on them the sap part will turn black, and the logs be worm eaten. If green white pine logs are cut in the summer when the bark will peel the sap part turns black, the boards mildew and soon rot, as will the logs. A green white pine tree chopped down, will last but a few years, unless fell when frozen, and the bark hewed off. A white pine tree blown up by the roots some ages or centuries ago, is the most durable timber we have. The sap part rots.

and the turpentine retreats into the solid wood, so that it appears greasy, and will gum up the mill saw. Such fallen trees, in time, coat over with moss and shew no inclination to rot.

In September and October, 1790, I made use of some such old and mossy logs, with green ones for weather boards and shingles. Those made of the green logs are on the decay;—those of the old logs shew no further sign of decaying, only they grow mossy.

I am clearly of opinion that formerly timber was more durable than latterly, and for the following reasons:—In the neighborhood of my nativity, (Bucks county, Penn.) there are three log buildings yet standing, much older than any person living. The one a large log barn built by my mother's father. The logs are peeled hickory. It belonged to my uncle. I have thrashed many days in it, for him, and frequently heard him say it was built by his father before his memory. If he were now living, he would be upwards of 100 years old. The other two are dwelling houses; and all three within a mile of each other. In one house the logs are peeled hickory; the other oak, with the bark on. Four years ago, I paid, perhaps, my last visit to the place of my nativity, and went to see all those old buildings. They did not appear in the least decayed; had been shingled a number of times; and one age or more had rolled away since any person living could remember the building of either, or which was oldest.

During the revolutionary war, there was a large log barn built in the same neighborhood, and in plain sight of those three old buildings. I was at the raising, did the chopping at one corner, and well remember the logs were all peeled hickory, and were very slippery to stand on. The barn soon rotted, and fell down, and twenty years ago I furnished the lumber from my mills at this place for a stone barn on the same spot.

Notwithstanding I had seen those old buildings within four years, as I have a younger brother in that neighborhood, since writing my publication of April 10th, I wrote him to go and examine those three old buildings, and write me the particulars of their condition, &c. He has done it. He says *they are all standing sound, and occupied as heretofore; and from any thing he could discover may stand as much longer*.

I have, some thirty-five years ago, been much employed in making roads through this part of the country called *Beech Woods*; and from my several observations am fully convinced that the quality of the soil has had no more to do with the kinds of timber, than the soil of Great Britain with the invasion of Julius Cæsar. One instance I will mention. In crossing a ridge, there appeared formerly to have been a great wind fall, all the trees lying tops to the north; the logs all coated over with moss; some very large. I avoided them what I could, and in cutting into them they were perfectly sound in the middle, and were white oak, yellow poplar, and hickory of large growths. There were none of either of those kinds to be found growing; all the standing timber was beech, sugar maple or hemlock. They appeared to have grown up since the wind fall. By cutting some of the largest they were found to be upwards of 200 years old.

New England has produced more very old

timber than the warmer southern states, and perhaps many such are yet living who have made useful observations on the properties and the duration of timber. All such observations should be published, as it is an important subject that will increase in consequence for future generations.

SAMUEL PRESTON.

FOR THE NEW ENGLAND FARMER.

POTATOES.

MR. EDITOR,

If you think the following article worthy of insertion in your valuable paper, after correction, you have it at disposal.

Potatoes, which are the most useful and profitable roots the farmer can make use of, are often spoiled and lost for the want of a little attention in planting, and securing them in autumn. It has been the custom of many careful farmers to plant their potatoes very early in the season, in order that they might dig them before frosts in the fall. Others think they better to defer planting them until late in the spring. Be that as it may, I will give you my way of raising and securing them. If they are to follow corn, which is my usual practice, plough the ground late in the fall, very deep, and let it lie until spring, when I manure properly, say ten cords of manure to the acre if in good heart; if not, I put on more. About the 20th of May, after the manure is even spread, I run it over with a plough just so as to cover it. I then, with a horse plough, mark out the land in rows, three feet distant one way, and about two the other—then take the second of my large potatoes and place them in the corner with the cut side down, with two pieces in each hill. This being done, I take two or three pieces of the cob of Indian corn and plant in each hill: then I cover them with earth. After they are up a hand full of Plaster of Paris or leached ashes dropped on every hill is essential service.

When the potatoes are ripe in the fall, this is, when the vines are dead, I dig them and put them into a pit, dug on a knoll, with a trench two feet deep, leading from the pit out, which I place a common pump log, with the end to the edge of the hole. After placing boards over the hole, cover the whole with a thickness of earth sufficient to prevent the frost from reaching them. In this way any quantity can be put together without danger of the heating. Care should be taken to prevent the mice from getting to the hole through the log by nailing a piece of tin with holes punched in it on the outer end.

A FARMER.

FOR THE NEW ENGLAND FARMER.

REMEDY AGAINST WEEVILS.

MR. EDITOR,

In your paper a few months since it was observed by one of your correspondents that Weevils did not migrate. It was but a few days before I saw that paper, that one of our most careful and experienced farmers made the same observation to me, giving as an illustration that some years since they got into one corner of his garret, in which he had always kept his corn, and were troublesome to him there for two or three years, but never got across to the other part of the garret. And he further o

erved that he had ultimately destroyed them, having in the part of the garret where they are a few plants of tobacco when first cut in a fall; and that from his own experience, and the observation of others, he believed this would generally prove an effectual remedy against them.

My own observation justifies me in the belief that they have but little disposition to emigrate, and if this be the fact, it will show the importance of not moving grain in which they are, to other parts of buildings; and suggests many easy ways of destroying or greatly diminishing them.

P.

From the American Farmer.

AGRICULTURAL PROSPECTS—REVERSED.

Wheatland, May 19, 1823.

DEAR SIR—In No. 7, of the American Farmer observe an extract from my letter to you of the 23d ult. and a corresponding one from another correspondent, giving the most favorable presentation of the state of our crops in this section of the country; as I conceive it to be of importance that the community should be kept correctly informed as to our "agricultural prospects," and as these prospects are most woefully and fatally changed since the date of the above communication, I deem it to be my duty to apprise you of the melancholy fact, to guard against the evils that might arise from erroneous impressions on this interesting subject. In consequence of the general failure of crops for three preceding harvests, together with the reduced prices of the staples of the country, a body of our farmers had become awfully embarrassed in their pecuniary circumstances, and they laudably determined to make an extraordinary effort last fall to relieve themselves in their difficulties by putting in much larger crops of small grain than usual. The rye harvest, been previously committed to the earth, the seeding of wheat commenced early in the month of September; and many of the largest crops were put in, and finished by the first of October. During the ploughing season not a drop of rain fell, and that operation was consequently performed in the best possible manner. At the latter end of September the rains set in—the heat was brought up finely, and being liberally nourished by a continuation of the most genial seasons, vegetation advanced with a rapidity and vigor never before experienced, and our fields by the month of December were abundant, and the growth as luxuriant, as generally in the month of April. The winter was considered to be unfavorable. Vegetation continued to advance with unprecedented rapidity during the early spring—and our fairer prospects received no check, until a few days after the first of May, when the wheat was discovered to be at a stand; this was at first attributed to the May-weed which sprung up in our fields a thousand fold thicker than was ever known; but as this weed is very short lived, and had heretofore been regarded as harmless, no apprehensions were entertained that as soon as its ephemeral growth was over, our crops would revive and flourish without farther interruption. Delusive hope! From that time the crops were perceived to decline daily and rapidly, and the farmer soon became assured that his hopes were blasted by the ravages of an enemy whose powers of desolation are unbound-

ed, and against whose assault he possesses no means of resistance. The havoc committed by the *Hessian Fly* is without example, and surpasses all description. Our fields are literally laid waste, and cattle are turned on many of them, which three or four weeks ago promised an ample remuneration to the industrious farmer for his anxious and toilsome care. His late hopes, so bright and so buoyant, are converted suddenly into black despair. I have already said that our people are generally in debt.—This misfortune exists to an alarming and awful extent. What they will now do under this new and severe calamity I cannot tell. It is known only to Him who in his inscrutable wisdom dispenses it!—Our clover has wholly failed for the two last seasons, and its place occupied with innumerable weeds of the most pernicious kind. The rye crops are remarkably good.

I have given you, my dear sir, a gloomy, but a faithful picture—rest assured it is not exaggerated.

With sincere regard and esteem,

Yours truly,

H. S. TURNER.

N. B. Great complaints, as usual, of the grub or cut-worm, in the early planted corn. Even mine has been severely attacked under circumstances that have resisted its effect uniformly for many successive years.

The following is copied from an English publication, but whether it will answer the purpose pretended, we cannot say. A trial might be made at a trifling expense.

DESTRUCTION OF FLIES.

Most of the fly waters, and other preparations sold for the destruction of flies, are variously disguised poisons, dangerous and even fatal to the human species; such as solutions of mercury, arsenic, &c. mixed with honey or syrup. The following preparation, however, without endangering the lives of children, or other incautious persons, is not less fatal to flies than even a solution of arsenic. Dissolve two drachms of the extract of quassia in half a pint of boiling water; and adding a little sugar or syrup, pour the mixture on plates. To this enticing food the flies are extremely partial, and it never fails to destroy them.

Best method of making common Sirup of Sugar for general use.

Dissolve one pound and three quarters of powdered double refined sugar in a pint of water, by means of what is called the water bath, or *balneum marie*; that is, by setting the vessel which contains it in a saucepan, kettle, or copper of water, over the fire, till the sugar be thoroughly dissolved, and the sirup properly formed. This, besides other advantages, prevents the danger of the sugar's boiling over, which is much to be apprehended in the common mode of boiling sirup in large quantities. After it has stood a few hours, take off the scum, and pour the sirup into a stone jar or bottle for use.

To make Broth without Meat.

Boil a small quantity of mushroom catsup in very thin gruel with a few leaves of stewed parsley, and a little salt. The mushroom more than any other vegetable substance, perhaps,

approaches the nature and flavor of wholesome animal flesh. Walnut liquor will by no means answer this purpose.

From Niles' Weekly Register.

Something Strange.—The two following articles are from late British papers. We give them as we found them, frankly confessing that we cannot understand what seems so gravely asserted—yet it seems probable that some great improvement in the art of printing is about to be brought into use.

From a London paper of March 2.

Dr. Church is now at Birmingham, preparing his new printing press. The compositor has only to set down at this curious piece of mechanism, as he would at a piano-forte, and as he strikes the keys, the types all fall from the case into their proper places, with a velocity that keeps pace with the most rapid speaker. The form having been worked off, the type moves into the melting pot, from which it is returned, re-cast in its original state, without any diminution of the material, and thence distributed into the case quite new. One of these presses, placed at the bar of the House of Commons, would always insure a correct report of the debate. Dr. Church, the inventor, is a native of Boston, in New England.

To the editor of the New Globe.

SIR—Permit me to correct an article which appeared in your paper of Monday, under the head of "extraordinary inventions," relating to Dr. Church's *printing apparatus*, which, as it there stands, conveys a wrong impression respecting it. The printing press that has been constructed, having flat surfaces, and though rapid in giving off the finest impressions, is in no way connected in its operations with either the composing or type founding machines.—Neither has Dr. Church asserted or even anticipated being able, by his composing machine, "to keep pace with the most rapid speaker," as is there stated; but he has been enabled, on a single machine, to set up more types, and with more correctness, than four compositors could do in the same time.

It is correctly stated, that little or no loss of metal takes place in casting the types, as the atmosphere is excluded from the metal when in a fluid state, and the only connexion there is between the composing and type founding machine is this—the type founding machine deposits the types in the case, in the order they are required by the composing machine, to which the case is afterwards taken, when required for use.

It is also true that the *form*, after being used, is returned to the melting pot, and the types re-produced anew; as this mode of *distributing* is much more rapid than the present method, and besides insuring a *perfect distribution*, also insures a new and perfect arrangement of the types in the order required for the composing machine, as well as producing a perfect letter. From the machinery he has already constructed, and the experiments made in the various branches of the printing apparatus, the most complete success may, with confidence, be anticipated.

Dr. Church is now at Birmingham constructing his machinery.

VERITAS.

London, March 18, 1823.

From the United States Gazette.

ANALYSIS OF CORN.

Dr. Gorham, of Harvard University, has made some experiments upon corn, in order to discover its constituent parts. According to his analysis, yellow Indian corn, in the common and dry state, is composed as follows:

	Common state.	Dry state.
Water	9 0	
Starch	77 0	84 599
Zeine	3 0	3 296
Albumen	2 5	2 747
Gummy matter	1 75	1 922
Saccharine matter	1 45	1 593
Extractive matter	3	3 879
Cuticle and ligneous fibre	3 0	3 296
Phos. carb. sul. of lime & loss	1 5	1 618
	100	99 980

The powder of the corn is hygrometric, and the quantity of water in it varies with the state of the atmosphere. Sometimes it would lose 12 per cent. on drying, at other times not more than half that quantity. In some experiments on the coloring matter of the different colored varieties of Indian corn, it was found to be soluble in both water and alcohol, and to become green by alkalis and red by acids.

A spirituous liquor may be obtained from Indian corn, in consequence of the changes which take place in its saccharine matter.

POLISHING POWDER FROM CHARCOAL.

Mr. J. Thompson, of Glasgow, turned his attention, some time ago, to the property possessed by charcoal, of giving a fine polish when rubbed on metals. This property is not possessed by charcoal in general, but has been found to belong only to particular pieces; no means were known by which such charcoal could be distinguished, except actual trial, nor was the cause of the superiority of some pieces over others, at all understood. Mr. Thompson, in consequence of being informed that the Dutch rush used in polishing wood, owed its powers to silex, was induced to suppose that charcoal, made from wood, growing on sandy soils, would have the property required, and on trial this was found to be the case. It frequently happens, that turners meet with wood which very rapidly turns the edges of their tools. Mr. Thompson procured some of this wood, and having converted it into charcoal, tried its polishing powers. They gave great satisfaction; and hence Mr. T. recommends, that turners, cabinet makers, &c. should lay aside such wood when they meet with it, as a source of charcoal to the copperplate workers, &c. to whom it is of more value than to the former, and who are constantly in want of polishing charcoal.

It may not be amiss to add, that the ashes of our Lehigh and Schuylkill coal has been employed with great success in polishing brass furniture.—*ibid.*

The following methods of making yeast for bread are both easy and expeditious: Boil one pound of good flour, a quarter of a pound of brown sugar, and a little salt, in two gallons of water for one hour; when milk warm, bottle it and cork it close; it will be fit for use in 24 hours. One pint of this will make 18 pounds of bread.

To a pound of mashed potatoes (mealy ones are best) add two ounces of brown sugar, and

two spoonfuls of common yeast; the potatoes first to be pulped through a cullender and mixed with warm water to a proper consistence. Thus a pound of potatoes will make a pound of good yeast. Keep it moderately warm while fermenting. This recipe is in substance from Dr. Hunter, who observes that yeast so made will keep well. No sugar is used by bakers, when adding the pulp of potatoes to their rising.—*ibid.*

PRESERVATION OF GRAIN, &c. FROM MICE.

Mr. Macdonald, in the Hebrides, having suffered considerably from mice, put at the bottom near the centre, and at the top of each sack or mow, as it was raised, three or four stalks of wild mint, with the leaves on, and never had any of his grain consumed. He tried the same experiment with his cheese and other articles kept in store and often injured by mice, and with equal effect, by laying a few leaves, green or dry, on the article to be preserved.—*ibid.*

NEW HAMPSHIRE CELEBRATION.

On the 21st ult. the settlement of New Hampshire was commemorated in a mode which has received, and doubtless merited, much applause. As ours is not, properly speaking, a news paper, we shall give but a brief outline of the proceedings, abridged from the Dover New Hampshire Republican.

After an appropriate Prayer by President Tyler, an Oration was pronounced by Nathaniel A. Haven, Jr. Esq. of Portsmouth. Of this performance it is sufficient to say that the speaker equalled the expectations of his friends. His discourse was classical, ingenious and eloquent; containing much valuable information, and indicating a liberal and cultivated mind. The Poem by Mr. Peabody, of Exeter, was a vigorous and spirited performance: that gentleman proved to the public that he possesses fine talents, and a knowledge of the history and antiquities of the country, scarcely less rare than the possession of such talents. Of both these performances, we shall only say at present, that we join in the general wish that they may be given to the public.

Some appropriate Odes, written for the occasion by the Rev. Thomas C. Upham, of Rochester, were sung in very fine style, by the members of the Handel Society in Portsmouth.—The exercises were about three hours long, yet probably no person perceived their length; every one regretted their conclusion. After the exercises two hundred gentlemen dined together in Jefferson Hall. Hon. John F. Parrott presided at the dinner, assisted by Edward Cutts Jr. Benjamin Penhallow, Enoch G. Parrott, and Samuel Larkin, Esq's. of Portsmouth, Colonel Chadwick, of Exeter, and Colonel Pierce, of Dover. Among the strangers present, were Judge Story of the Supreme Court of the U. S. Rev. Mr. Palfrey, Daniel Webster, Geo. Blake, and Nathan Hale, Esq's. of Boston; President Tyler, and Professors Adams and Haddock, of Dartmouth College, together with many of the Rev. Clergy, and gentlemen from the adjacent towns.

The dinner was chiefly of Fish, of all known names, and cooked in all possible variety. After the cloth was removed, the following Toasts were drunk, and many fine songs finely sung—copies of which we hope soon to obtain.

1. The planting at Pascataquack "in the spring" of 1623, and the rich harvest it has yielded.

2. "The goodly forests, fair vallies and chrysal hills of Laconia."

3. The heroes of Louisburgh—an earnest New Hampshire prowess.

4. Major Sullivan and Captain Langdon—our delegates to Congress in '75; who supplied Bunker Hill with powder from his Majesty's fort at Pascataquack.

5. The New Hampshire regiments in '77 at Bennington, Stillwater & Saratoga; Gen. Blandin and Monmouth.

6. Meshech Weare, at once Speaker of the House—Chief Justice, and first President of the State.

7. The Fisheries—the first interests of the first settlers of New Hampshire.

8. The absent sons of New Hampshire, who have made her name abroad to be respected let us at home with gratitude remember them.

9. Our literary and religious institutions—Monuments erected to the memory of our ancestors by their own hands.

10. The surviving Patriots of the revolution—a few bright stars yet adorn the horizon.

11. Our Fathers two hundred years ago, at our descendants two hundred years hence—May there be no weak link in the great chain that connects them.

12. The cause of '76 all over the world—May it have the spirit of '76 to maintain it.

VOLUNTEERS.

Hon. D. Webster being called upon for toast, remarked that although not at home, he hoped he should not be considered entirely a stranger; he reminded the company—of whom none had forgotten—that he was a native of New Hampshire; he briefly but eloquently remarked that this was the land of his birth—of his education and of his dearest associations; the pleasures of the day were not a little heightened by the consciousness that those were present who directed his studies in youth, and assisted him with their counsel in manhood; he said he could not better express his feelings than by the words of the Poet:

NEW HAMPSHIRE.

"Where'er I roam, whatever realms I see,
My heart untravell'd fondly turns to thee."

Hon. Judge Story remarked that although not a native of this state, he was yet a citizen of New England; and he adverted to those circumstances which did excite and which ought to excite throughout New England a similarity of feeling and sentiment, as they produced unity of interest. He then called the attention of his auditors to that country from which New England was settled, and gave

ENGLAND.—The land of our forefathers, at the land of their descendants—May it ever enjoy with us, a common learning, a common religion and a common liberty.

By George Blake, Esq. of Boston. This day a thousand years hence—May it find our posterity as free, as prosperous, and as happy as has found us.

By the Rev. Mr. Palfrey, of Boston. The two May flowers—the one which bore the Pilgrims to New England, and the other the strawberry blossom, which met the first settlers of N. Hampshire on the banks of the Pascataquack.

By Rev. Mr. Burroughs, of Portsmouth. *Dr. Belknap*, the historian of New Hampshire.

By Hon. John F. Parrott, president of the day. The manners and principles of the first settlers of New Hampshire: Bold in enterprise—persevering in action—intrepid in danger—patient in adversity:—May a double portion of their spirit rest on their descendants to the thousandth generation.

By Mr. Moore, of Concord. The Orator and Poet of the day.

By Edward Cutts, Jun. Esq. *The Fisheries*, and *John Quincy Adams*, their modern defender.

By Judge Hale, of Barrington. The Militia of New Hampshire.

By Alexander Ladd, Esq. The distinguished guests who have retired.—It is not among the least of the honors of the day, that it has been honored with the countenance and company of such men.

In the evening a very superb ball was given at Franklin Hall, in which it is supposed there were present nearly four hundred ladies and gentlemen. The walls of the room were entirely covered with portraits of eminent persons who flourished in this state before the revolution—the Wentworths, Jaffreys, Warners, Sparhawks and Atkinsons of old times. After spending the evening in innocent gaiety the company separated at a seasonable hour; every one was pleased with the transactions of the day;—the most perfect order and good conduct were manifest in every particular—there was no confusion and no disappointment: the sentiment was universal, that every thing which could have been done, was done, and every thing that was done was well done.

NEW ENGLAND FARMER.

SATURDAY, JUNE 7, 1823.

The Farmer's and Gardener's Remembrancer.
JUNE.

ATTEND TO YOUR FRUIT TREES.—The ground immediately about fruit trees should be kept loose and free from weeds. Where the best orchard cultivation is practised the soil around the fruit trees is dug at least twice a year, in spring and autumn. While the trees are young, you may raise arable crops, such as potatoes, Indian corn, cabbages, &c. but be very particular not to injure the roots of your trees by ploughing too near them. When you have completed your ploughing, dig up the grass which the plough leaves. If you find that your trees are infested with lice (a sort of vegetable barnacles, which look like half a kernel rye, and ascend apple trees some time in this month) you may destroy them, as we have been told, with a swab and hot water. Mr. Cobbett, speaking of these insects, says, "As to the diminutive creatures that appear *as specks in the bark*, the best, and perhaps the only remedy against the disease of which they are a symptom, consists of good plants, good planting and good tillage."

WATERING PLANTS.—All the books of agriculture and horticulture which we have ever read, with the exception of Mr. Cobbett's work on Gardening, recommend the occasional watering of plants. Mr. Cobbett, however, says, "Watering plants, though so highly recommended in English Gardening Books, and so much in practice, is a thing of very doubtful utility in any case, and, in most cases, of positive injury.

A country often endures present suffering from long drought; but, even if all the gardens and all the fields could, in such a case, be watered with a watering pot, I much question whether it would be beneficial even to the crops of the dry season itself. It is not, observe, rain-water that you can, one time out of a thousand, water with. And, to *nourish plants*, the water must be prepared in clouds and mists and dews. Observe this. Besides, when rain comes, the earth is prepared for it by that state of the air, which precedes rain, and which makes all things *damp* and *slackens* and loosens the earth, and disposes the roots and leaves for the reception of the rain. To pour water, therefore, upon plants, or upon the ground where they are growing, or where seeds are sown, is never of much use, and is generally mischievous; for the air is dry; the sun comes immediately and bakes the ground and vegetation is checked rather than advanced by the operation. The best protector against frequent drought is frequent *digging*, or, in the fields, *ploughing*, and always *deep*. Hence will arise a fermentation and dews. The ground will have *moisture* in it, in spite of all drought, which the hard unmoved ground will not. But always dig or plough in *dry weather*, and, the drier the weather, the deeper you ought to go, and the finer you ought to break the earth.—When plants are *covered by lights*, or are in a *house*, or are covered with cloths in the night time, they may need *watering*, and, in such cases, must have it given them by hand.*

We do not wish to vouch for the correctness of all Mr. Cobbett's theories, nor can we say how much confidence is due to what we have just quoted. We believe, however, that many people water their plants, when they would do better to let them alone. Perhaps the question of watering or not watering plants admits of no rule not liable to a vast many exceptions. The kind of plant, the period of its growth, the nature of the soil, and the degree of drought which is prevalent, are all circumstances to be taken into consideration. Dr. Deane, whose authority, in questions relative to American Husbandry, has at least equal weight with that of Mr. Cobbett, says, "Vegetables that are newly transplanted, as they have their roots more or less diminished, or otherwise injured, often need watering till they have taken new root. But this should be done with caution. If a dry season follow the transplanting, let them be watered if they appear to droop, only on evenings, and in cloudy weather, and with water that has been exposed one day at least to the shining of the sun; not with water directly from a well, or a cold spring, as it will give a chill to the plants. Only a small quantity should be applied at once, that it may have an effect similar to that of a refreshing rain. For water, applied too plentifully, sometimes washes away the finest of the mould from the roots, or makes little cavities about them which admit too much air.

"In a dry season, whole gardens sometimes need watering; and in doing it the above precautions are to be regarded. They are happy who have a piece of standing water in their garden, or a rivulet near at hand, from whence the garden may be watered without much labor."

* American Gardener, par. 197.

Mr. McMahon says that "newly planted fruit trees will be greatly benefited by occasional waterings, which should always be given in the morning, and frequently over the branches as well as about the roots; this will be of great service in washing off any dust and filth which their leaves may have contracted, and in opening their pores for the reception of atmospheric moisture."

"Watering with common water proves very beneficial to trees infected with insects; especially if thrown against them with some force, by means of a small water engine. This will not only displace caterpillars and many other insects, but greatly refresh the trees, especially in dry weather; and if often repeated where insects appear, it will considerably diminish their number, and prevent their spreading.

"The most eligible engines are such as have the pump and discharging pipe fixed in the vessel for containing the water; of which some are of a moderate size for carrying about by hand, but larger ones are fitted upon a low light, three wheeled carriage, for the more convenient removal from place to place. This engine may be conveniently used for watering different parts of the garden in dry weather."

We have heretofore adverted to the practice of Swiss and Flemish farmers, of leaching or washing manure, and applying the liquid part to their growing crops. If your soil is not very rich, it may be well, whenever you water your vegetables, fruit trees, &c. to use liquids of this kind, or such as may be obtained by leaching ashes, soot, &c. or a mixture of all these substances. At least those who have but little land and much leisure may employ themselves very philosophically in making experiments of this kind. A little soap, tar or turpentine, and extract or decoction of elder superadded to your liquid would be as it were taking a bond of fate to destroy your insects. Thus you may answer three valuable purposes at once, viz: 1st. Water your plants or fruit trees—2d. Manure, do.—3d. Kill off the insects which infest them. But it may be advisable, 1st, To decant or strain your liquid before it comes in contact with the buds, leaves or flowers of vegetables, lest it should close the pores and stop or check perspiration: 2d. Apply nothing too corrosive or stimulating, such as lime water, strong lie, or a strong solution of salt directly to growing plants: 3d. If your soil is rich, probably pure water, or at least water impregnated alone with some substance which is hostile to insects, such as elder, or tar may be preferable.

WATERING WITH SEA WATER.—Salt has been highly recommended both as a manure and as an antidote to insects. Some writers, however, condemn it, and in large quantities we know that it totally destroys vegetation. So a small quantity of salt will, it is said, hasten putrefaction, but a large quantity puts a stop to it. We have not merely the authority of books, but we have been told by farmers in this vicinity, that they have experienced great and decided advantages from salt used as a manure. Sea-water is undoubtedly to be preferred, as a manure, to common salt, as it contains many substances favorable to vegetation, which do not enter into the composition of common salt.

Dr. Deane observed that "In the year 1786, one hundred hills of potatoes near the shore were watered with sea-water, about two quart-

in a hill, being one hour's work for a man.—The crop was half as much again as in the same number of hills adjoining. The water was applied to the sod just after planting the sets, which I suppose to be the best time of doing it, as there can be no danger of burning the young shoots, and as the salt will be mixed with rain and the moisture of the earth, before shoots are produced.

"In the year 1787, alternate rows were watered in the same manner with sea-water. The result of this experiment was uncertain; because by ploughing off and on between the rows, the earth of the watered and unwatered rows was blended together. But altogether a good crop was obtained.

"The same year a piece of flax was, in the month of June, very short and yellow on one side of the piece; but of a good color on the other and much taller. This induced the owner to water the poor side from the sea. In ten days it was equal in length and color with that on the other side, though very little rain fell in the time. At pulling, the watered side was evidently better grown than the other. This was a sufficient demonstration of the advantage of sea-water, when the land lies adjoining to the sea shore, so that the labor of applying it is inconsiderable. The above experiments were made in a clayey soil.

"In a sandy soil, the same year, watering the ground where French turnips were just sown, had an excellent effect. Though it was a spot where the turnips had been destroyed by insects several years successively, they generally escaped this year. Not more than one painful was applied to a drill row two rods in length, wetting the ground over the seeds soon after sowing.

"Salt water applied to tender plants, most commonly proves too strong for them, if applied when the ground is dry. But if it be wet, the strength of the water is abated by mixing with the juices of the soil, before it is taken up by the roots, and thus it is rendered innocent and safe, as I have found by experience. The seeds bear the application of the sea water better than the young plants do."

The Farmer's Assistant gives the following directions relative to the use and application of sea water as a manure. "Sea water might be carried from the sea some distance on the land, to advantage, in the following manner: Take a one horse cart, and suspend a tight box, rightly shaped, under the axle-tree, the box having a valve in the under side; drive the cart into the water, and the valve opens and lets that fluid into the box; and, when the cart is driven out, the valve closes and holds the water.

"When the cart is driven out to the ground on which the water is to be spread, this operation may be performed in the manner we shall next describe: A tube is to be provided, say twelve feet in length, with small holes bored into it at the distance of six inches apart, and the ends of the tube closed; attach this to the under side of the box, cross-ways, at either end, so as to be out of the way of the wheels of the cart.

"When you come to where the water is to be spread, it is to be let out of the box into the tube, by an aperture for that purpose; and as the cart moves along, the water runs out of each of the small holes in the tube, and thus

sprinkles over a piece of ground of twelve feet wide, till the whole is exhausted.

"With the next load, begin where the water ceased running before, and thus continue the watered strip across the field. Then take another strip of twelve feet wide adjoining that already watered, and thus proceed till the whole has been gone over.

"In this way a man would carry out, say forty cart loads a day, at the distance of half a mile, or half that number if a mile: as but little time need be spent in loading or unloading.—About ten loads of a hundred gallons each would probably be sufficient for an acre at one time."

There can be no doubt but the application of sea-water would prove fatal to cock-chafers or grubs, cut-worms, &c. Liquid manure of any kind may be expeditiously applied in the way above mentioned. The water from drainings of dunghills, or that which is collected from reservoirs of liquid manure, or from stagnant pools, &c. might well be applied in this way, and answer useful purposes.

SEA SAND, SEA MUD, &c. may be put into corn and potatoe hills in some situations to good advantage. Mr. Wm. Moody, of Saco, Maine, in a letter to the Hon. Josiah Quincy, published in the Massachusetts Agricultural Repository vol. iv, p. 353, says, "I am persuaded, from experience, that sea sand, put under corn or potatoes with manure, or spread on the land, will go far, if not wholly, to the total destruction of those destructive worms [wire worms, which are small red worms about an inch long, the bigness of a large needle] on which nothing else seems to have any effect. It has a beneficial effect spread on land before ploughing, or even after land is planted with corn or potatoes, not only to destroy the wire worm and other insects, but to increase the crop. With my neighbors a load of sea sand is considered preferable to a load of their best manure, to mix in with their common barn manure, or to spread on their gardens and low flat land."

Fastening for Doors and Window Shutters.

We have understood that a person in East Bradford, (Mass.) has invented a contrivance, which is very simple in its nature and effectual in its operation, to fasten window shutters and outward doors, both back and when closed.—This implement becomes fast of its own accord, and will be found to conduce much to the ease and comfort of those who may be inclined to adopt it. The expense hardly exceeds that of a common hasp. It is not a patented machine, and has already been put in operation in several buildings, and perfectly answers the purposes for which it was intended.

THE GREAT RACE.

Perhaps nothing has ever occurred in the United States which has given so violent a fillip to public curiosity, and set expectation so decidedly on tip-toe, as the wonderful horse race lately enacted at Jamaica, on Long Island, between the super-superb N. York horse ycleped Eclipse, and the extra-eminant Virginia courser known by the appellation of Henry. The race ground was crowded with spectators, some say not less than from 10 to 50,000, some of whom, if fame does not tell fibs, came no less than five

hundred miles to be witnesses of the contest between the glory of the North, and the pride of the South! Mr. Niles, editor of the Weekly Register, says, that "the cost of travelling and other expenses of the strangers, may be fairly estimated to have been a million of dollars—and the value of the time and money of all, wasted or expended, cannot be supposed at less than two millions. The amount of the bets can only be guessed at—it is very possible that they exceeded a million; for the "sporting world," from the extreme East to the extreme West, and the extreme North to the extreme South of the United States, was engaged in this affair! Few have gained much by it—but many have lost what should have went to the payment of their just debts, and are ruined."

According to the best authenticated accounts of this most memorable matter, Henry beat Eclipse the first heat by about half a length. The second heat Henry took the lead the first and second mile, but in the third Eclipse passed him and came out several lengths ahead. In the third and decisive trial, Eclipse led between two and three lengths. In the third mile Henry came up within about half a length of his rival, but in the fourth and last mile Eclipse maintained his ascendancy, and came out a length and an half ahead, thus winning forty thousand dollars, the principal bet, besides nobody knows how many bye-bets, and about as much renown (more or less) as the Duke of Wellington won at Waterloo.

The following is stated to be the time of running:

First heat	7 minutes, 40 seconds.
Second do.	7 do. 49 do.
Third do.	8 do. 24 do.

This is said to be the greatest speed on record for a long time. Goldsmith says, (Animated Nature, vol. i. p. 132,) "An ordinary racer is known to go at the rate of a mile in two minutes; [probably for a single mile] and we had an instance in the admirable Childers of still greater rapidity. He has been frequently known to move at the rate of 82½ feet in a second, or almost a mile in a minute; he has run also round the course of New Market, which is very little less than four miles, in 6 minutes, 40 sec. But what is very surprising, few horses have been since found that ever could equal him; and those of his breed have been remarkably deficient."

ARTILLERY ELECTION.

On Monday last the Ancient and Honorable Artillery Company, commanded by Brig. Gen. Lyman, celebrated its 135th anniversary. At noon the company escorted his Excellency the Governor, and numerous officers of the State Government, and that of the United States, to the Church in Chauncey Place, where an eloquent and appropriate Discourse was pronounced by Rev. Dr. Gardiner. After the religious

exercises, the assemblage moved to Faneuil Hall, where an excellent dinner was provided, of which more than 300 persons partook. After having drank a number of appropriate toasts, the company marched to the common and elected their officers for the ensuing year.

AGRICULTURAL PROSPECTS.

We learn from a number of sources of information, as well as from personal observation, that the summer has commenced with a flattering appearance of a fruitful season. The plentiful rains, together with an atmosphere in general somewhat chilly, has caused grain and grass to set well, or be very thick at the bottom. The tardiness of Spring has kept back the budding and blossoming of fruit trees till the season has made such progress that frost will not be likely to destroy the blossoms or fruit; and, should the smiles of Providence be continued, this year will be crowned with more than customary plenty.

MASSACHUSETTS LEGISLATURE.

Hon. James L. Hodges was chosen Senator to supply the vacancy in Bristol county. Rev. Mr. Jenks, of Boston, was elected Chaplain of the House of Representatives, and Rev. Mr. Walker, of Charlestown, Chaplain of the Senate.

A committee of the Senate reported a resolution, which was unanimously accepted, expressing "the high sense they entertained of the urbanity, integrity, and wisdom of their deceased colleague," Hon. John Phillips, "and of the great respect which is due to his memory for long and valuable services in many public offices of great responsibility and honor, and more especially for the distinguished ability with which for a series of years, he has discharged the duties of President of the Senate of this Commonwealth," &c.

In Convention, the following gentlemen were elected Counsellors, viz: William P. Walker, Esq. Jesse Putnam, Esq. Hon. Marcus Morton, Nathan Chandler, Esq. David Cummins, Esq. Hon. Thos. Weston, Hon. Solomon Smead, Ebenezer Fisher, Esq. and Abraham Lincoln, Esq. who have accepted and been qualified.

George Sullivan, Esq. was elected Senator to supply the vacancy in Suffolk District.

On Wednesday, pursuant to assignment, the two houses met in Convention for the purpose of receiving the communication from his Excellency the Governor. The Governor and Lieut. Governor, attended by the Council, the Secretary of the Commonwealth, and the Sheriff of Suffolk, then came in, and his Excellency delivered a speech from the Chair. The Convention then separated.

FOREIGN.

A late arrival at New York, has brought London dates to the 23d of April, one day later than had before been received. The head quarters of the Duke d'Angoulême, according to accounts from Bayonne of the 20th of April, were at Vittoria. The French had captured Pancorbo, and found in that place 31 pieces of cannon, with bombs, shot, &c.

In the British Parliament, the unwarrantable conduct of the invaders of Spain was animadverted upon with much severity, and motions were made for papers and information relating to the aggression. On the 22d of April, Mr. Canuing declared that he knew of no agreement entered into by the Allied powers at Verona, to assist France in carrying on hostilities with Spain, and did not believe that any instrument was

signed for that purpose. In the House of Lords, on the same day, Lord Liverpool stated that if Portugal was attacked without provocation on her part, England would be obliged to assist her; but if Portugal provoked an attack, Great Britain was under no obligation to interfere. Lord Liverpool likewise stated that there was a prospect that Austria would make arrangements to pay a part, if not the whole, of a great loan made to her some years since by England. The Emperor, he observed, has become a bankrupt, and intends making a composition with his creditors; but he had not seen his name in the Gazette. Of course he cannot be entitled to a certificate, according to law in such cases.

Ireland is in a state of great commotion. A large proportion of the lower orders appear to be making war on society at large, and to have sworn hostility against all kinds of property. Having suffered for want of provisions, they now destroy every thing they can lay their hands on, which might otherwise serve for food for man or beast. They are like petulant children, that quarrel with their bread and butter. If oppression has driven this wise people mad, their oppressors have much to answer for. Burning houses and stacks of grain, killing cattle, and laying waste the country, seem to be the order of the day, and the amusement of the night; and the equality which is aimed at appears to be that dead level of misery, in which all are consummately and equally wretched.

The Pirates exterminated.—Havana letters of the 17th May, announce that the troops sent into the interior, and on the coast, to destroy the pirates who had taken shelter there from American and British cruisers, and renewed their depredations on land, have been very successful, and have swept the haunts of those marauders.

DOMESTIC.

Four Milch Cows.—The cow which took the premium at the Cattle Show in Connecticut last fall, was raised by Mr. Benjamin Bishop, 2d. of West Hartford, from the stock of Mr. Ozem Woodruff. The actual weight of her milk from May 22, 1822, to April 1, 1823, was eighty-nine hundred and ninety-three pounds, or 1000 gallons—equal to thirty barrels.

Precautions against Disease.—The Board of Health in New York have adopted some regulations to prevent among other things the casting into the streets of garbage, vegetables and offals. They are ordered to be kept on the premises until the bell cart calls, or thrown into the river, under the penalty of two dollars; and it is directed that the gutters in front of every building and lot during the months of May, June, July and August, shall be washed and cleaned twice every week, under the penalty of two dollars.

Good green oak wood (says a Philadelphia paper) is now selling at our wharves at \$3.25 a cord. This low price is attributed to the discovery of coal, and the facilities afforded by water carriage.

Norwich, (Con.) May 28.

Auful Tempest.—On Sunday afternoon this vicinity was visited by a thunder storm which prostrated several barns, fences, trees, &c. and occasioned other destruction. At Montville, while the Rev. Pastor of the Church in that place was directing the attention of his flock to the tempest, by reading the hymn which begins:

Methinks the last great day has come,
Methinks I hear the trumpet sound,
That shakes the earth, rends every tomb,
And wakes the prisoners under ground,

a bolt of lightning struck the cupola of the meeting-house, shattered the bellry, shivered several of the posts and pews in the interior, and instantly killed Mrs. Bradford, a widow, aged 72, and Mary Comstock, a child of nine years of age, and injured several other persons. There was no conductor to the house; and the vane was supported by a piece of iron, which it is supposed attracted the lightning. Another meeting-house was struck about the same time, and the lightning being conducted by the rod, did the building no injury.

Captains Rodgers, Chauncey and Morris, are on a visit of inspection to the northern naval posts.

AGRICULTURAL ESTABLISHMENT.

NO. 29, MERCHANTS' ROW,

(At the East End of the Old Market.)

FOR sale as above, a variety of the most approved single and double mould board Ploughs, C. Howard's improved cast iron mould board, with wrought Shear and Coulter, Cast iron do. do. do. J. Seaver & Co's. do. do. Bigelow's wrought do. do. Warren's much approved common Ploughs, Sinclair's side hill do. do. do. Howard's much improved Cultivator, an implement highly esteemed for its utility in drill cultivation. Bennett's Broad Cast, Seed Sowing Machines, for large and small seeds, Eastman's improved Straw Cutter, Safford's new invented Straw Cutter, much improved. Common hand Straw Cutters, An English Vegetable Cutter, Stevens' patent steel spring Hay and Manure Forks, Steel spring Potatoe Hoes, English cast steel broad Hoes, Common and steel do. do.

A great variety of Garden and other Agricultural Implements. June 5.

POT-LUCK.

Yankers are fam'd for "everlasting dinners,"
So call'd by John Bull's gormandizing sinners.
Where'er of such a Frenchman comes in view,
He cries at once with wonder—"O, mon Dieu!"

The Yankee still is modest and polite;
And when a favorite guest he would invite,
'Tis, "come and dine with me, good sir, to-day,
In a snug, family, familiar way;"—
Or, "take *pot-luck*; I promise not a treat;
But commonly can something find to eat."

A traveller once from France, all nice and pretty,
Arriv'd in famous Boston town—now city;
Call'd at a merchant's counting-room, and there
Says, "Sare, me have one letter to you sare."
The merchant o'er it cast a careful glance,
And found 'twas from a faithful friend in France.
"Dear sir," says he, "call in at four and dine
With me on *pot-luck*, take a glass of wine,
Then at our leisure we can talk the better
About the contents of this pleasing letter."

"Sartain, good sare, my compliments I pay;
Sartain I call," then bow'd and went away;
Thinking in French, "what is this *pot-luck* dish?
Is it made up of flesh, or fowl, or fish?
It sure must be a dainty in this nation;
I'll dine agreeable to invitation."

The Frenchman watch'd; and when the clock struck four,

He gave four knocks upon the merchant's door;
Was usher'd in;—by all was kindly greeted,
Soon at the table honorably seated;
A table groaning with a vast variety,
Where gluttony might stuff e'en to satiety.

Says merchant to the Frenchmen, "Sir, you see,
We treat our friends *sans cerr-mo-ni-c*.
What from this quarter shall I to you pass?
There's a boil'd turkey here, and oyster sauce,
Sir, you must look about you—there, by ma'am,
Are some boil'd chickens and a decent ham."

"O sare, me take von very leetle piece
Of ham and shicken, sare, if madame please,"
'Twas handed, and he nibbled, as unable
To relish any thing upon the table.

This course remov'd, another soon appear'd,
Which even Epicurus might have cheer'd;
Roast turkey, goose, ducks, chickens, partridge, brants;
The merchant fell to carving:—"Come, who wants
A piece of this, or this, or that, or t'other?
I'll help each guest as tho' he were my brother."

The Frenchman nibbled, as he did before,
But look'd as though expecting something more.
Next in came puddings, custards, jellies, pies;
He nibbled still, and star'd with wondering eyes,
When told on these he must attempt to dine,
As there was nothing more, but fruits and wine.

"No more!" cries Frenchmen; "don I plainly see,
I make mistake, kind sare; you pardon me;
Your language I no understand; O, vat luck!
I wait'd all dis time to dine on *pot-luck*!"

From the United States Gazette.

HYDRAULICS.

Description of the Tools used in Boring for Water.

"The first tool used is an auger; the shell part, which forms the hole or bore in the earth or strata thro' which it passes, is mostly from 2 to 3 inches in diameter; the hollow part of

it being about one foot four inches in length, and constructed nearly in the form of the carpenter's common auger. The rod parts are formed in separate pieces, of four feet long each, which screw into one another by means of what is usually termed a male and female screw, to any suitable length, one after another as the depth of the hole or bore may require. The size of the stem above the auger part is about an inch square, except at the joints, where, for the sake of strength, they are a quarter of an inch more. There are also a chisel and punch for screwing on, in going through hard gravel or metallic substances, in order to expedite the passage of the auger, which could not otherwise perforate such hard bodies. The punch is often used when the auger is not applied, to pierce or open the sand or gravel, and give a more easy issue or discharge to the water. The chisel is an inch and a half or two inches broad at the point, and made very sharp for cutting stone, and the punch an inch square like the other part of the rods, with a sharp point also. There is a shifting handle of wood which is fastened with two iron wedges affixed to it, for the purpose of turning round the rods in boring, and also two iron keys for screwing and unscrewing the rods, and for assisting the handle when the soil is very stiff, more than two men being required to turn the wheel; sometimes a windlass is used. The manner of using the auger in working it, is simply thus: two or three men are necessary. Two stand on a stage, erected about 12 or 14 feet above the ground, who turn it round by means of a wooden handle, and when the auger part is full, they draw it up out of the hole, and the man below clears out the earth with an instrument for the purpose, and assists in pulling the auger up out of the hole or bore, and in directing it into it again, and can also assist in turning with the iron handle or key, when the depth and length of the rods require additional force to perform the operation. The workmen should be careful in boring, not to go deeper at one time, without drawing an exact length of the shell of the auger, otherwise the earth, clay or sand, through which it is boring after the shell is full, may make it difficult to pull out. A cylindrical pipe being placed in the hole and driven downward with a mallet, and the boring continued, the pipe may be forced down to a greater depth, so as to reach the water or spring. Wells made in this manner are superior to those constructed in the common method, not only in point of cheapness, but also by affording a more certain and constant supply of water. In case the water near the surface should not be of good quality, the perforation may be continued to a greater depth, till a pure fluid can be procured.

The pipes should be either of cast iron, or other metallic substance, and made to fit, with great exactness, the aperture made by the boring auger, or they would not be durable, but speedily become leaky and out of order. The best mode would therefore probably be that of having metallic pipes cast for the purpose, and formed so as to fit exactly upon each other, to any depth that might be necessary in boring for water. When old wells have become injured or tainted from any circumstance or accident, being previously emptied, the bottom may be perforated in a similar manner, so as to

reach the lower sheet of water or main spring. The water will then rise in the cylindrical tube in a pure state, and flow into the body of the well or pump fixed for the purpose of bringing it up."

From the Providence Gazette.

A machine for removing the sick has been invented by Mr. John C. Jenckes, of this town, which, where it has been in operation, is pronounced to be of great utility. A person confined to his bed, may by this machine be raised with perfect ease to himself, and with little effort or labor on the part of attendants, to such a height and for such a time, as to give an opportunity for making the bed and for changing the linen; and in warm weather the patient may be much refreshed by being raised and kept at a distance from the bed. The motion is so regular and easy that it is stated a person asleep may be raised without being awakened. A committee of the Association of Mechanics and Manufacturers of this town, having examined the machine, made a favorable report respecting it; and by the recommendation of that committee, the Association have ordered one to be procured for the use of the members.

From the Detroit Gazette.

COAL.—There has lately been discovered in the vicinity of Flint river, in this territory, a quarry of Slate Coal. We were furnished with a specimen of it, and found that it burned easily on applying the blaze of a candle to it. Its grain is very fine, and it does not soil even the whitest paper when rubbed upon it. The flame which it produces is considerable, and of a white appearance, and the effluvia of the smoke is much like that which is thrown out by the English cubical coals, used in some of our commercial cities. Its ashes are white, and not abundant, and from its durability and heat in an igneous state, it is believed that this coal will become, in a short time, an article of consequence to the people of the territory.

We have been informed that the quarry is of considerable extent, and that gentlemen have already gone to examine it.

Saint Foix tells a story of a young woman, who, on a promise of marriage, suffered herself to be seduced by her affection and the tears and intreaties of her lover. He immediately after became rich and broke his promise. Her relations, in spite of her opposition, sued the seducer, and he was condemned either to marry her or pay her one thousand francs. When they came to announce to the high-spirited girl the result, "I refuse both," said she; "I will neither sell my virtue, nor be the wife of a scoundrel." She took the veil.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but those who pay within *sixty days* from the time of subscribing will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the Publisher) until arrearages are paid.

Complete files from the commencement of the paper in August can be furnished.

Agents who procure seven subscribers, and become responsible for the payment, will be entitled to a copy gratis, and in the same proportion for a larger number.

No. 46.

FACTS AND OBSERVATIONS RELATING TO AGRICULTURE & DOMESTIC ECONOMY.

BY THE EDITOR.

ON THE SITUATION AND CONSTRUCTION OF BARNs.

The observations and directions of foreign writers on husbandry, relating to this branch of rural economy, are very copious. Some valuable ideas for an American farmer may be expected from the mass of matter, though the eastern part is not adapted to our climate and circumstances. The following remarks were written by Mr. Samuel Gibson, an intelligent Pennsylvania farmer, "who to the experience of an excellent practical agriculturist, adds that of an active and ingenious mechanic, and who has erected a spacious barn, which is esteemed a competent judge, a model of neatness and convenience."* His opinion in general, on the construction of such a building of stone, sufficient to accommodate a well cultivated farm of 100 acres, 40 of which may be supposed to be good land, is as follows:

"The situation should be as near the middle of the farm as can conveniently be, and on ground sloping towards the south, so as to admit water being brought through wooden pipes, in the ground above, and raised in the yard practicable, or at least that it may pass through the yard. The site should not be nearer than 100 yards from the dwelling-house, as in case of fire breaking out in either, the other might be safe; it also conduces to cleanliness, and where any of the family happen to be sick they will not be disturbed by the noise of the barn, stables, &c. The dimensions might be 70 feet by 36; the hill dug up upon a level, and the earth removed from the barn yard. The building to be of stone; foundation sunk two feet below the level; walls two feet and an half thick at bottom, and to continue so to the height of the stable doors; the ground so much sloped as to be five feet high when the hill is cut down, and a wall raised close to this, at the distance of seven feet from the barn; this intermediate space would admit a free circulation of air round the barn and stables below; over this a gangway is to be raised, leading into the barn floor; an excavation may also be made in the hill under this, to which a door through the aforesaid wall may conveniently lead, which will form a very suitable place for stowing away potatoes and other vegetables. The stables to be seven feet in height clear; and the wall two feet thick, set right in the middle of the wall below; from that to the rear of the barn the thickness may be reduced three inches on each side, and carried up 20 feet above the stables. Above this the gables may be raised 15 feet, which will give sufficient slope to the roof, which ought to be covered with the best cedar shingles or slate. The ground area below may be divided into four spaces for cattle, horses, &c.; none of which divisions ought to be less than 12 feet wide, with an entry between the two rows of creatures

whose heads should be towards the entry. The foundations of the partitions, a stone wall 18 inches thick, rising 10 or 12 inches at least above the floor, on which a frame of wood work should rise to the joists. The stable floors paved with pebble stones, descending from the troughs, with a like descent towards the door. The advantages of such a floor are, that it will not harbor rats and other vermin, and is durable; the hardness ought to be no objection, as plenty of bedding should be furnished for the purpose of increasing the quantity of dung. Raise the barn floor seven feet above the bottom of the hay-mow, which will leave 12 feet for the height of the barn floor, which ought also to be its breadth. The advantages of raising it thus are many; the labor of pitching your hay is very much reduced; you acquire a good room between that and the stables for stowing grain, &c. The labor of raising the entrance to the barn floor is trifling in comparison of what the labor of pitching it would otherwise occasion; and if the ground rises with a considerable angle, backwards, the difficulty of raising the gangway will be still less. The barn floor should be laid with three inch oak plank, well seasoned: each plank ploughed with a half inch iron, within an inch of the lower edge, and a strip put in each point, which will keep the whole firm and solid, and effectually prevent dust, &c. from getting through; it might also be an advantage to have glass windows in the granary, and back of the barn floor, the sides of which may be defended by the boards which form the sides of the granaries, next the hay mows, and ought to rise four feet above the thrashing floor. Fixed ladders on each side of the barn floor are also convenient to get at the hay above. In each hay mow a square hole of four feet must be run up, from the entry below to the top of the mow, and framed to prevent the hay from stopping it up. These may serve a two fold purpose, that of conveying hay down to feed with, and as ventilators. It may also be observed that the stable and entry doors ought all to be arched, and the hinges and fastenings of all the doors of iron built into the wall in the simple form of hooks and eyes, the hook making part of the hinge; the stable floor should also be as high as the sill of the door, and ascending back.

"Round stone pillars, two and an half feet in diameter, may be raised at equal distances from each other in front of the stables, and eight feet apart; these may be made as high as the stable floors, upon which a frame might be erected to such a height as to be conveniently covered by the general roof; which would form an excellent corn house, and would also shade the stable floors. Steps should be placed under this frame leading into it, and also into the granary under the barn floor. This frame or corn house, should be so high from the ground as to admit a cart or waggon below it; and should also have an opening in the door to pour the corn down. The main entry to the corn house to be through the thrashing floor.

"A barn built upon these principles would produce a saving of at least one hand daily, in the single article of pitching hay, as one person

may haul and tumble into the barn as much hay as three could stow away in the usual way, which is of considerable consequence in harvest time, when work is pressing. One man will pitch the hay from the waggon on the barn floor, up to the whole square of the barn, as fast as two or three can stow it away; whereas, in the common way of building barns it would take two to pitch it up. Indeed it might be questioned whether it would not be an advantage to raise the floor still higher, on this account, as pitching hay is the hardest part of stowing it away; this would also increase the size of the granaries. To this some object, on account of its rising above the square of the barn, but this is nothing when put in competition with the advantages to be derived from the facility of pitching, as the roof may readily be formed so as to admit of it.

"Objections have been made against stone barns, as not being sufficiently airy, and being damp, so as to injure the grain; inconveniences more imaginary than otherwise, and which the writer of these observations has never experienced; but which, if they did exist, might soon be remedied by plastering the outside of the north-east end of the building, and projecting a penthouse from the square, which if attended to, and a sufficient number of windows left, all of which that are under the eaves, and otherwise not exposed, having Venetian blinds, with a large ventilator on the top of the roof, on which may be fixed a lightning-rod; such precautions will most assuredly prove the superiority of such a stone barn to all others."

It is not probable that more than one in a million of our New England farmers, would and could build a barn altogether according to the plan mentioned above. But some hints might, perhaps, be gathered from it, which would prove useful in erecting a building which is of so great importance to a farmer. We believe it may be well, in general, so to construct a barn that carts or waggons may be drawn in on the second floor, which may be situated at any commodious distance above the ground floor, or on a level with what New England farmers call the *scaffolds*. The second floor may contain the sheaves of grain, and a part of the hay. If no side hill exists in the place where it is wished to build the barn, (according to Mr. Gibson's plan) a bridge or causeway may be made, commencing on the ground at a proper distance from the barn, and terminating on the second floor, by which loads may be conveyed. It will be very convenient if the whole is so contrived that teams may be driven in at one door and out at another opposite, instead of having to submit to the awkward process of *backing out* the unloaded cart or waggon. Cellars to barns, under planks which are placed on sills or sleepers and form the floors of the stables or cattle stalls, are becoming fashionable in New England, and are no doubt very convenient and economical. Into such cellars the dung of the stables can be shovelled with very little labor; and if this can be so constructed as not to freeze, and have room for holding mud loam and other materials for making compost to be deposited in

*American edition of Rees' Cyclopaedia, Art. BARN.

them, in autumn;—those materials may be mixed with the dung in the winter, and the process of making compost, carried on in the coldest weather. The liquid manure of stalled cattle &c. by that mode of management might be imbibed by earth, &c. in the compost; and the products of fermentation secured and turned to account. By this or similar modes of proceeding a farmer may more than double the quantity and greatly enhance the quality of his barn manure.

FOR THE NEW ENGLAND FARMER.

CUCUMBERS.

I have many times dug a hole in the earth about two feet deep and two in circumference, nearly filled it with straw or old hay, and then covered it over with small stones. Around this hole, and about three inches from the edge, planted cucumbers; and as they grew and began to vine, stuck in bushes, such as are used in sticking peas, all around the cucumbers, on the out side, about nine inches from the roots. These bushes are stuck in slanting so that the top end would rise about a foot from the earth. As the vines advance, put another row around in the same way, beginning about half way between the top ends of the first and the place in which the but ends were put into the ground; and then a third row, and so on as circumstances require. From one such hill I have had gathered at one time near two pails full of cucumbers; and the vines will continue to bear much longer than those planted in the usual way and suffered to run directly upon the ground. The advantages of the hole, straw and stones, are these. The degree of wet is almost entirely under the control of the gardener; and the vines saved from the inconvenience often experienced from turning water upon them. If it is a dry season, and the soil dry, a pail full or more of water may be turned into the hole at once. P.

FOR THE NEW ENGLAND FARMER.

A SURE WAY TO DESTROY CATERPILLARS.

Many ways have been devised to destroy caterpillars on trees, such as the application of spirits of turpentine, live ashes, burning brimstone, &c. I have tried all these remedies, but never had much success; they effect a partial, but not a total destruction of them. They may be driven from their nests, torn to pieces, and some of them may be killed; but those that are not destroyed are sure to collect on another limb and renew their attack upon the defenceless foliage. The most effectual way that ever I have tried, is to blow them "sky high," with a gun or pistol—this will destroy them. The way that I work it is to put the powder into the gun without any wad, and hold the muzzle within about a foot of the nest in such a position as to range the whole of it, and then discharge it;—this will clear the limb of nest, worms and eggs. This method is not so expensive as some may imagine. A pound of powder which may be bought for about two shillings, will destroy 75 or a 100 nests, and the gun or pistol would be more useful in this business, than when in the hands of the fowler, or in those of a Southern duellist. S.

It is said the most violent hæmorrhages may be stopped by the volatile flour of alkali.

From the American Farmer.

JOHN S. SKINNER, ESQ.

Dear Sir,

So much has been written and said, about "Improved Short Horns," that there is little to be given by me in their praise, but the results of my immediate observation. I had ample opportunities abroad, I have most sedulously availed myself of all the means within my reach at home, to obtain accurate information on the comparative merits of the various breeds of neat cattle, of which we are possessed. I control more than a thousand acres of alluvial meadow, as well as many farms, and large bodies of wild lands, in Pennsylvania, New York and Maine. I am thus led to mingle with farmers both in this and in other states, to examine their cattle, and ascertain their properties, as well as the products of the soil; whilst my own farm enables me to prosecute any system of experiments, which I may be led to attempt. I have had cattle bred in Kentucky, Maryland, Virginia, Maine, Massachusetts, Vermont, New York, and Pennsylvania. I have traced every importation, of which I had heard. I can distinguish Mr. O'Donnell's, Patterson's, Gough's, and Parkinson's importations for Maryland—the Holstein, Alderney, Irish, Dutch, Flanders, Britany, Pole and short Horn breeds brought into Pennsylvania by Mr. Sims, Cunningham, Ross, Waln, Hamilton, Kettland, Guest, and Haines: the families of various degrees of affinity, to the pure race of "Short Horns," carried to New York by Col. Deveau, and Mr. Heaton—the Leicestershire, Lancashire, and Hereford cattle, taken to Connecticut, Massachusetts and Maine, by Mr. Wadsworth, Stewart and Vaughan. Of most of these importations I have had individuals, and of all, have carefully examined some of the progeny, either here, or at a distance.

I have possessed an hundred and fifty cows, calves, bullocks, and bulls within three years. I am a member of the society of learned farmers. I have attended cattle shows without number, I have read "Albion," "the Memoirs," and I reside near farms of "large dairies devoted;" thus without boasting of my brilliant accomplishments, or elaborate acquirements, in all that relates to the tail of a sheep, the buttock of a bull, or the bag of a cow, I may venture to state what I and my cattle have done.

For some animals of the breeds, which I designate, I had given great prices; yet the best of them all, I sold for but sixty dollars a head, about the time I gave nearly five hundred dollars for two imported "Improved Short Horn" cows—and from Mr. Williams of Massachusetts procured eighteen or twenty yearlings, and calves by his extraordinary Bull Denton. I have since obtained three imported heifers; for one of them by North Star from a cow by Comet I paid in England five hundred dollars. Among my stock a Chinese and Devon heifer, a yearling and cow from an imported Devon, by an English bull, also heifers and cows bred upon our meadows and mountains have been placed, to decide the questions, which have caused among breeders so much dispute. All my experience has shown, that the extent of excellence in the animal, whether in points, properties, shape, disposition, early maturity, or tendency to secrete fat, or afford rich milk is determined, by the degree of affinity to the pure race of Improved Short Horns. That my Durham cows are deep

milkers, that they are *hardy** have elastic pliant hides with thick soft coats, that when dry, they are easily made fat, that whilst yielding milk they become thin, has been proved to my entire conviction. Might not "Albion" be asked whether he did not forget, that although it is difficult to "blow hot and cold at the same time" that it is possible to blow hot in June, and cold in January. The tendency towards fat, proceeds I should presume, from the power of the animal's stomach, and intestines to separate the nutritious, from the excrementitious parts of aliment. Nature wisely destines certain portions of nutritious matter at proper times, the secretion of milk—that milk is an unctuous and very nutritious fluid, cannot be questioned much therefore of nutrition is withdrawn from the milk from the formation of fat—but does follow, that such portions as have made butter or produced fat in the calf, when no longer directed towards the secretion of milk, must necessarily lose all their properties, and pass in urine or in dung? Do we not invariably find that all cows when dry become more ready fat than when they give milk? Is it not to be inferred that the matter which would have passed off in milk, may be made to produce fat? Does not our experience show in all families of wild cattle, where the perverseness of man has not interfered with the dispositions of nature that when kept quiet, and well fed, they exhibit great tendency towards secretions of fat. In cattle even of Asia and China, in the Kyloes of Scotland, in the wild breeds of Louisiana, and in the little mountain cows of America, such disposition is generally shown.

The mistaken ingenuity of the breeders of Holland, whence all the deepest milkers, whether Holderness, "Old Short Horns," Holstein or whatever they may be termed in America are in some measure derived, carried them into an absurd "cross," affording excessive secretions of bad milk; thus not only prematurely exhausting the animal by which they are given but at all times requiring great quantities of food for her support. That disease, peculiar tendency towards fatness or leanness, or copious supplies of thin, or lesser quantities of rich milk or even the determination of a particular colic towards any definite part of the body, as what at the end of a Devon's tail, may be established by perseverance, and art, every man conversant with the subject, will readily believe. Because a Dutchman chooses to wear out his cow, he has a race of animals, which will not readily become fat, even when dry; and the cupid of the venders of milk in the neighborhood of large towns in England, or America, has them to propagate this unthrifty breed of cattle is it to be inferred, that the efforts of Collin and his coadjutors, could not obtain by cross a family, which are fitted at different times, the production of milk, and secretion of fat.

Yours, &c. CURWEN

Philadelphia County, April 18th, 1823.

* The hardness of this breed of cattle, was forced upon me, on the estate of a scientific and eloquent agriculturist, who in his contempt of the old fashioned method of driving, and ploughing the earth, unluckily left barns without fodder, and his fields bare of grass, to great mortification of himself in the last spring, when he emerged from his closet, and discovered that his schemes had all failed, and his cattle had starved, except those of pure "Improved Short Horn" blood.

MURRAY's System of Chemistry, says "the food is a compound of this kind," &c. "and if I suppose a fluid thus passing through tubes of different diameters, and undergoing successive decompositions, we may easily conceive that very different products may be formed from the same original compound. This affords a simple view of the nature of secretion. No complicated apparatus is requisite for the performance of the change, all that is necessary being the propulsion of the blood through minute vessels, capable of contraction. It has accordingly frequently been observed, that new products are formed without the intervention of glands; such is the formation of the fat or of muscular fibre. It is easy to conceive that the formation of these may take place in the extreme vessels, where these products are deposited; and in like manner, in the mere course of the circulation, may be formed the gluten, albumen, and other principles of the blood itself.—From secretion a variety of products are formed, as the bile, milk, fat, the bony matter, the matter of membranes, and a variety of others.—These complete the formation of animal matter, and comprehend its several varieties. Such are the different steps of the process of animalization. The food is digested in the stomach, mixed with animal matter in the intestinal canal, and converted into chyle: this mingles with the blood, and uses a portion of carbon in the lungs: in the extreme vessels it is converted into the general principles of animal matter; and in the glands, converted into various secreted products."

White, vol. 4, chapter 1, of the formation of the digestive organs of the cow, page 13. "The stomach then may be considered both as a muscular and as a vital organ. If we view it in another light we shall consider it as one continued bibulous surface, sucking up the chyle as it is formed, and conveying it by means of the milk-vessels, the four receptacles which are named the quarters of the udder. There is another order of absorbent vessels in the stomach, and in the small intestines also, especially in the upper part, named lacteals, which ramify through the mesentery, and terminate in the thoracic duct, having previously passed through what are named the mesenteric glands; that is for the most part, for some are seen going over their surface. These lacteals are subsidiary, and occasional to their office, serving to convey chyle when the mesenteric glands are inflamed and obstructed. Chyle, as we find it in the lacteals, is exactly like milk in every respect, and is, in fact, the same thing. The fluid of the thoracic duct is different; it is semi-transparent, has always a little oil floating on it, and is now and then found mixed with a little blood, which probably falls into it after death, from the great vein in which it terminates. This depends on the valve of that part giving way, in consequence of death. Chyle and milk are then precisely the same thing; and in the cow there are three thoracic ducts, two going to the udder and conveying milk, and one to a great vein near the heart, conveying that fluid from which the blood is formed. When the animal has young, the lactiferous vessels, for so the minute branches of the two former thoracic ducts should be named, have a predominant aptitude to absorb the chyle, and a sufficient quantity only is taken up by the chyloferous vessels going to the third thoracic duct to supply the heart."

NOTE.—The Editor takes the liberty of adding the following extract from a letter from Col. Edward Lloyd. Speaking of the Improved Short Horns, Champion, Shepherdess and White Rose—sent in by Mr. Charles Champion of Blythe, Nottinghamshire, England, Col. Lloyd observes "I found Champion and the heifers in fine order on my return; they were, and still are too fat. I assure you that Shepherdess reduces *but slowly*, although I feed her alone on *corn tops*—and Champion is still too fat, although I have reduced his feed to a half gallon of meal per day. Their *fattening qualities* far exceed my expectation, and are almost incredible."

Note by the editor of the New England Farmer.—The foregoing is the production of a very distinguished agriculturist, whose science and practical information place him among the first of the foremost of American agriculturists. It contains much valuable information, not only as respects facts, but theory, relative to improving and improved animals of that species which is the most valuable of any which have ever submitted to the dominion and ministered to the necessities of man. It may not be amiss to observe, that Col. Jaques, of Charlestown, Mass. possesses the "Improved short horns," which are the object of Mr. "Curwen's" merited encomiums, in all their purity. The bull Cœlebs is a descendant from the famous bull Comet, the same remove with the "extraordinary bull Denton." Denton and Cœlebs are both grand-children to that celebrated sire of fine cattle. The merits of the latter are probably as great, and (at least in this vicinity,) are as highly appreciated as those of the former. Cœlebs, we are told, has, every season, 50 cows, at 10 dollars each, a fact which proves our agriculturists are not insensible to the merits of that valuable animal.

The following is extracted from an able Essay, entitled, "*Remarks on the Agriculture of Massachusetts*," published in the Massachusetts Agricultural Repository, vol. v, p. 317.

George Adams, in his Treatise entitled "The New System of Husbandry," develops his mode of managing an acre, which, according to his statements and calculations, is equal, in result, to raising food enough in one season, on one acre, to keep one cow 1089 days, which is three years, wanting only six days!! We shall not vouch for the actual experiment, to the extent stated. His mode, however, is unquestionably excellent, and the product must be great, even should it considerably fall short of the amount he asserts.

His mode is this:—

His cattle are kept in houses in winter and summer, so contrived as to save both dung and urine. He plants in the fall, or as early as possible in the spring, drumhead cabbages, in rows, three feet wide in the rows, two feet between the plants; that is, three plants in every square yard. Thus an acre will contain 14520 plants. If the land be poor the plants ought to be nearer. On good land in the English climate, they ought to weigh fifteen pounds each, upon an average, by the first of June. This is equal to 217,000 pounds, or one hundred and eight tons to the acre. He allows each beast thirteen cabbages and 1-4th or 200 lbs., for every day and night. The product of this acre, then, will keep twenty head of cattle fifty four days; or one head, one thousand and eighty-nine days—nearly three years.

Adams' system is connected with soiling cattle, or keeping them in houses during the whole summer, and is capable of still farther extension. For he states his practice to be carefully to cut off the cabbages by the head, leaving their stalks cut across at the top, to grow again.

As soon as a few rows are cleared off, he spreads the dung and urine carefully over the ground. The cabbage stalk, being left, will soon sprout again. Then with a small hoe he cuts the ground over, so as to cover the manure, and sows turnips among the cabbage stalks. He continues to do this until the whole ground is gone over. He asserts that, in that climate, by the first of November he has as great a product, as at first.

In this way, land is improved by bearing crops, and one acre of land made to keep twenty horned cattle 108 days, or three and a half months!!

Without vouching for the result of this experiment, in the extent here specified, it is simple and practicable enough to enable any one to satisfy himself of the greatness of its product, and must have a strong tendency to awaken the attention of practical farmers to the subject.

From the Old Colony Memorial.

THRESHING MACHINE.

A writer in the Memorial of Feb. 22, wishes to know whether there has not been a machine invented for threshing English grain, which will bear the test of experience. The following is offered in reply.

A machine has been invented by Timothy Howe, Esq. of Turner, (Me.) which he has denominated *Howe's Improved Threshing Machine*, for which he has obtained letters patent, dated December 3, 1822.

This machine is said to unite *durability with cheapness and simplicity*, and to answer the purpose of threshing admirably well. It operates with convenience in a common barn floor, and threshes as fast as one hand can fairly untie the bundles and put them into the machine.

The right for the counties of Plymouth and Bristol in this state, and for the state of Rhode-Island, has been purchased by an enterprising young man in Middleborough, who is erecting a machine for the inspection of those who may wish to examine it, and to exhibit its usefulness at the approaching harvest. Though patented, this machine is within the reach of every practical farmer, as the cost of making, together with the right for using one machine, will not exceed \$25, and it may be so constructed that it can be removed from one place to another, so as to serve for several neighboring farms. If we may judge from the rapid sale of the right for making, vending, and using these machines in various parts of the United States, we believe it must be a very valuable invention; and it is confidently trusted that the hopes of agriculturists will not be disappointed by this machine's being "withdrawn into obscurity and oblivion."

Middleborough, May 13, 1823. C.

To prevent Fishing lines from rotting.

Never wind your lines on your reel wet; at least, when you get home, wrap them round the back of a chair, and let them be thoroughly dried, otherwise they will soon rot, and cannot be depended on; with this care they will last a considerable time.

From the Poultney, (Vermont) Gazette.

Messrs. Smith & Shute—

As I recently caused to be published in your paper, some remarks on the subject of Dairying, perhaps it will not be inexpedient to offer a few observations in support of the theory therein contained. Considerable diversity of opinion seems to exist concerning the manufacture of butter; and the query seems to rest—whether it is not, the most effectual means of giving it a preservative quality, when made, by cleansing it from the milk, with water. A few reasons may be deduced, which, to me, together with considerable personal observation, appear conclusive, in favor of cleansing it with pure spring water.

In the first place, it is a fact, which it needs no argument to establish, that so long as there is any part of the acidity of the milk retained in the butter, it cannot be preserved; and I conceive it to be beyond a possibility, to cleanse it from this acidity, except through the aid of water. This may be proved by simple experiment:—When the butter is churned, let it be thoroughly worked over, so that the milk is apparently entirely out—then thrown into clear water, and it will be discovered that the water will become white and sour with the milk.—This, then, simply shows, that the sourness cannot be got out by working only.

It is thought, by some, that by washing, the water takes away the goodness of the butter.—But if any of the goodness can be washed away, why is it not done with the brine, which is generally added to preserve it? Every one most know, there is no affinity between oil and water; and such is the nature of butter. By letting the water, in which the butter is washed, stand for a time after being used, it will be easy to discover what part or quality of the butter is taken out; as it will gather upon the top—which will convince any one, that there is nothing taken from it which should not be.

It is the general practice of those who put down butter to keep, to put it down in brine, which I consider the best method of preserving it; and unless it is cleansed from the milk, this brine becomes a butter-milk-brine, and will not preserve it from rancidity—so it is when the butter is not put into brine, the salt mixing with the particles of sour milk left in the butter;—whereas, on the contrary, if the butter is washed in pure water till it runs clear from it, the little particles of water which are retained in the butter, when salted, assist to dissolve the salt, and become, of themselves, pure particles of brine, interspersed throughout, which will effectually preserve it. Now, if brine be a preservative, which is universally acknowledged, of what consequence is it, in what manner it comes into the butter, provided it is pure and clear when it gets there;—whether it be added after the butter is made, salted, and carried to the merchant, or at the time it is made? It seems very rational, that the sooner the butter is left of the sour milk, and a pure brine takes its place, the better it is.

In hot weather, butter is frequently brought to market full of little hard specks of coagulated milk. This is thought by some, impossible to prevent;—but it may, in a measure be remedied, by often stirring the cream, after skimming; and what remains may be entirely got out by washing. The cream, however, should never

stand till this coagulation so forms. Butter being of a concrete substance, the union of its constituent parts is formed with difficulty, through the imposing barriers, conjunct with its original state; and these are scarce ever so entirely removed, but that something of an acid nature remains in it. Let the butter be sweet when churned, and every acid substance removed from it by washing, and it will not, with facility, inhale from the atmosphere, that substance which, being cherished, as it lights upon the surface, by particles of acidity, creates that fetid, offensive flavor, usually called *frow*.

Rancid butter is said to be one of the most unwholesome and indigestible of foods;—and if there can be any improvement upon the manner of preserving it, it will not only prove beneficial to the general health, as an article of consumption—but will enhance its value, as a market commodity. A. B.

From the Dutchess Observer.

MR. BARNUM—The season will soon arrive when almost every farmer can save his own Timothy Seed, and that at an expense of not more than seventy five cents per bushel, while the market price is generally from 4 to 5 dollars.—I take an interest in the improvements of agriculture and the happiness of my fellow citizens: and herewith furnish you with the following mode of saving this kind of grass seed, which I think is at once cheaper, easier and better, than any other mode with which I am acquainted.

PROCESS.—When about half of the heads or tops of the grass had changed their appearance, or become whitish, I sent two men with mowing scythes, and one with a common grain cradle (the fingers of which were pretty close together, to gather up the heads of the grass and to prevent them from dropping through) into the field; and they began to work in the following manner. One of the men, with his scythe, mowed a *swath* to make room for the tops of the grass to be laid from the *cradle*. The man with the cradle followed, cutting the tops of the standing grass as high as could conveniently be done and save the heads—laying the same in or near the middle of the mown swath, (in the same manner that grain is laid from the cradle) for the purpose of leaving room for the mown grass or stubble, of the mower, who immediately followed the cradle. In this manner, the tops were kept separate from the mown *stubble*. It was found necessary for the man using the cradle, to stand near the *edge* of the standing grass, that he might with more facility lay his tops out of the way of the stubble, to be cut after him it was also found that one man with a cradle, would cut the tops about as fast as two others could mow the stubble after him. And in this manner they proceeded till they had cut as much as was intended.

Then with rakes, they gathered up three or four of the seed or cradle swaths, and laid them sufficiently spread, by the side of another cradle swath; which made a space for spreading the hay or stubble, which at a proper time, was raked and carried off.

The seed tops remained, as above described four or five days, (which when the weather is dry will generally be long enough) and then it was ready for threshing. The tops may be threshed with horses or flails—which ought to

be done on a hot, dry day, and as soon as the heads are sufficiently dry. I threshed mine last season on the fourth day after being cut, with horses—within half a day—from grass which grew on about 1-4 acre of ground, and it did not stand very thick.

MARTIN E. WINCHELL.

North East, May 12, 1823.

From the Albany Plough Boy.

From the first settlement of America, land have always been considered so plenty and so cheap by our predecessors, that little attention has heretofore been had to economise the soil. Recently, from a variety of concurring circumstances, especially from the stimulating measures of numerous agricultural societies, it is found much to the interest and happiness of individuals to renovate worn out lands, as they have been called, in preference to submitting to the privations and miseries of seeking new land in distant regions. Among numerous successful experiments to renovate worn out lands, the following well authenticated fact is worthy the notice of every farmer. David Lawton, a Quaker farmer, from Rhode Island, settled some years ago in the town of Washington, county of Dutchess, 13 miles east of Poughkeepsie. His neighbor Amos Herrick, pressed him for some time to purchase 20 acres of land adjoining his farm, which had been lying in common, as worn out abandoned land, for seven years. At length Lawton purchased the 20 acres at \$5 an acre payable in five years without interest, with the privilege to abandon at the termination of that period. Lawton's purchase was the sport of the neighborhood; it was pronounced worth nothing, as it was subject to a small tax, and that even mullen would not grow on it. The ensuing spring Lawton fenced in the 20 acre with substantial rails, and proceeded as follows.

First year, ploughed deep, sowed oats, and put on 3 quarts of clover seed; and a bushel of plaster, immediately after sowing, to the acre and soon after the field became green, a second bushel of plaster to the acre; left the crop to rot on the ground, and permitted no creature to run on the land.

Second year, put on another bushel of plaster to the acre in the spring; there was a good crop of clover, which was again left to rot on the ground, and no creature permitted to feed on it.

Third year, nothing was done in the spring but a vigorous growth of clover covered the whole twenty acres, which was ploughed in with 4 oxen to a good depth; the whole field smoked while the clover was in a state of decomposition. As soon as it was sufficiently rotted, the field was cross-ploughed, and when mowed it was thoroughly ploughed for a crop of wheat, which was nearly got in, and in a sufficient quantity in the month of September.

In the 4th year, reaped as fine a crop of wheat as Dutchess county had ever produced, which sold for two dollars a bushel. Lawton paid the purchase money before it was due, refunded all his expenses, labor included, and had \$20 in pocket. Two years after he refused \$50 an acre for the same land, and fairly turned the tables upon his sneering neighbors. The soil was a dark loam intermixed with coarse gravel.

CA-IRA.

NEW ENGLAND FARMER.

SATURDAY, JUNE 11, 1823.

The Farmer's and Gardener's Remembrancer.

JUNE.

DESTROY WEEDS.—The destruction of weeds is one of the most important branches of the art of husbandry. If this be neglected, or imperfectly performed, from one third to one half the crop is usually lost. If weeds are allowed to grow, we lose a part of the advantage of manuring our land. The mixture of weeds in the soil prevents the crop from receiving the beneficial influence of the air. Weeds among grain greatly increase the trouble and risk of harvest; for a crop, which is free from weeds, will need much less drying than one which is mixed with them. Indeed, it would require pages to make a complete recapitulation of the evils which arise from these "*green snakes*," as they are sometimes called by farmers, which embrace agriculture with folds almost as deadly as those with which the Anaconda or Boa Constrictor incloses its prey.

Although wheat, and other broad cast crops, we believe, are rarely, if ever, weeded in this country, there can be little doubt but that in many instances it would be good economy to pull out the weeds by hand in the same way that they are extracted from growing crops of garden vegetables. Sir John Sinclair says, "various experiments have been tried to ascertain the *positive advantage* derived from carefully weeding one part of a field, and leaving another part undone; among these, the following, made with peculiar accuracy, may be safely relied on.

"1. *Wheat.*—Seven acres of light gravelly land were fallowed, and sown broad cast; one acre was measured off, and not a weed was pulled out of it; the other six were carefully weeded. The unweeded acre produced 18 bushels; the six weeded acres 135 bushels, or 22½ per acre, which is 4½ bushels, or 1-4th more produce in favor of weeding.

"2. *Barley.*—A six acre field was sown with barley in fine tilth, and well manured. The weeding, owing to a great abundance of charcoal, cost 12 shillings per acre. The produce of an unweeded acre was only 13 bushels; of the weeded, 23. Difference in favor of weeding, 15 bushels per acre, besides the land being so much cleaner for succeeding crops.

"3. *Oats.*—Six acres sown with oats; one acre ploughed but once and unmanured; produce, 17 bushels. Another six acres ploughed three times, manured and weeded, produce 37 bushels. This experiment shows that oats require good management, and will pay for it as well as other crops. Ten bushels of the increased produce may be fairly attributed to the weeding; and the other ten to the manure."

We have not known wheat or other broad cast crops weeded in the United States; but perhaps the recital of the above experiments may, in some cases, induce individuals to make trials of this mode of freeing their fields from vegetable robbers. At least all the rye, cockle, dandel, &c. should be pulled up, in wheat fields, before they produce their seeds. "In some countries, particularly in Scotland, the people make as much account of weeding their fields of grain as their gardens. This should by all

means be performed before the time when the plants begin to send out their ears; because, after this, they will be more in danger of being hurt by people's passing among them. Especially the wheat or other grain ought not to be touched while it is in blossom."*

Care should be taken not to carry the seeds of weeds into the fields which are intended for white crops. When fresh dung is made use of, it should be applied to land on which Indian corn, potatoes, or some other hoed crops are raised. You should not suffer weeds, either in gardens, or on any part of the farm, to go to seed. If you have not time to dig them up, you can at least mow them down with a scythe, and you will thus, by preventing the production of the vegetable progeny, realize the truth of the wise saying, that "an ounce of prevention is worth a pound of remedy." Our readers have already been cautioned against sowing the seeds of weeds with any kind of grain.† To prevent this, a thorough cleaning of the seed should be accomplished by winnowing, sifting, washing, &c. But the seeds of weeds are often sowed, after they have been separated from grain by winnowing. This will be the case when the chaff and rubbish at the tail of the heap of winnowed grain is thrown upon a dung hill, which is to be removed and applied to the soil, before the seeds contained therein have had opportunity to vegetate and get destroyed.

Weeding flax is considered in Europe, and by good husbandmen in this country, as necessary to secure a good crop. It should be carefully weeded when the plants are only three or four inches high; they are not then injured by the laborer going barefooted over them. It is not supposed to be injured by the clover and grass sown with it; on the contrary the Flemish farmers think them beneficial, by protecting the tender roots from drought, and keeping the weeds under.‡ Land, however, which has lately been cleared from its original growth of wood, or lately broken up from sward, will, generally, produce broad cast crops, which require no weeding.

INDIAN CORN.—"When the plants are three or four inches high, run a furrow with a one horse plough in the intervals between the rows as near as can conveniently be done without injuring the plants, making two furrows in each, turned from the rows, and then the weeds killed with the hand hoe, and a little fresh earth drawn about the plants." Such are the directions of Dr. Deane; but Judge Peters, of Pennsylvania, says, "Wherever the harrow has been fairly tried, its advantages over the plough, in corn crops, have been decisively shewn." Perhaps the question whether the plough or harrow is to be preferred, like many others in agriculture, admits of no definite answer, but depends on the nature of the soil. If that is hard, stony and uneven, the plough will loosen more mould, and destroy more weeds than the harrow; but if the field is level, mellow and dry, the harrow should, we think, be preferred, at least for the first time of hoeing. Judge Peters asserts that

"Transplanting from a seed bed, sown early, broad cast, in or convenient to your cornfield,

* See Deane's N. E. Farmer.

† See communication of O. Fiske, Esq. in our paper, No. 23, page 222.

‡ See Mr. Pomeroy's Essay on Flax Husbandry.

or with supernumerary plants, from other hills is far preferable to using seed corn for supplying defective hills cut off by the grub, or otherwise vacant. Plants even take and keep pace with those uninjured; but renewals with seed corn seldom arrive at maturity."

A writer in the American Farmer, vol. ii, p. 35, informs that he does not set or transplant his corn, as it never succeeded with him.

"Salt is used for destroying grubs, worms, &c. and has been successful in banishing or killing the corn-grub," as we learn by Judge Peters, but we are not told what quantity should be applied to the hill, nor the time of its application. We have been told by a practical farmer, that a small handful of salt, put into the hill at planting, preserved Indian corn from the wire worm and other insects. We should apprehend, however, that if salt is placed in contact with young plants it might injure or destroy them by its acrid qualities.

"A handful of ashes on each hill will nourish the plants and have a tendency to prevent their being annoyed by worms. Some lay it on just before the first or second hoeing. It will have a better effect in preventing worms, if laid on before the corn is up. But it is commonly designed to answer chiefly as a top dressing; and for this purpose it would answer better near the third hoeing; for then the plants want the greatest degree of nourishment, as they begin to grow very rapidly. Two dressings with ashes, to answer the two purposes, would not be amiss."* "This practice of dressing the hills does best when applied at the first hoeing, and repeated again at the third hoeing; the first brings forward the stalk, and the last the corn."† "It is essential to have this plant started well; because if it get stunted at the outset by cold rains, it seldom gets the better of this during its whole growth, particularly if the soil be not perfectly suitable to it. To prevent this, it is best to apply some stimulants to the plants at that time; and the best for that purpose are bog dirt, marle (dug out of bog-swamps,) ashes and gypsum. The latter ought, however, to be preferred on all soils to which it is suitable, because it is cheap and easily applied."‡ Plaster, ashes, &c. are usually applied immediately after weeding, and left on the top of the ground. But it is recommended by a writer in the American Farmer, vol. i, p. 5, in case of dry weather to cover the plaster, "as long droughts and hot sun are injurious to its stimulating powers."

PUMPKINS.—If you have any spare land of a suitable quality you may perhaps as well raise a crop of pumpkins. They will grow on any kind of soil which is proper for hoed crops, but the land cannot easily be made too rich for them. The Farmers' Assistant thinks they will grow better when planted by themselves, than when raised with Indian corn. Dr. Deane likewise expresses the same opinion. It is directed that hills for pumpkins be placed about seven feet apart, and only one plant should finally be suffered to stand in a hill. The crop is much less expensive to raise than Indian corn, and we are told that an acre properly cultivated will produce as much as ten tons, worth at least 16 cents a hundred for feeding and fattening cattle. Instead of a summer fallowing for wheat, a farmer might derive a handsome profit by

* Deane's N. E. Farmer.

† Farmers' Manual.

planting this vegetable. "The pumpkin crop would require two ploughings and two hoeings while growing, and another good ploughing would then be requisite to fit the ground for the reception of the wheat. The intervention, therefore, of the crop of pumpkins would require the two ploughings, which are requisite for it while growing, more than is commonly given to land when summer fallowed in the usual way. Whether the crop could be ripened and the ground cleared in season in autumn for sowing winter wheat, we cannot say, but believe it generally might. Give the hills plenty of seed to guard against accidents, insects, &c. and pull up the supernumerary plants in due season."

INDIAN CORN FOR FODDER.—"The husbandmen of America would do well to try the method of cultivating Indian corn, as practised in Italy, France and Spain, where it is sown very thick in broad cast, for producing fodder, and for stall feeding or soiling."* "Every farmer knows how eagerly cattle devour the entire plant of Indian corn, in its green state; and land in good condition will produce good crops of it. Some years ago, just when the ears were in the milk, I cut close to the ground the plants growing on a measured space, equal, as I judged, to the average product of the whole piece, and found that at the same rate, an acre would yield twelve tons of green fodder; probably a richer and more nourishing food than any other known to the husbandman. And this quantity was the growth of less than four months." "It has appeared to me that the sort called *sweet corn*, (having a white shrivelled grain when ripe) yields stalks of richer juice than the common yellow corn. It is also more disposed to multiply suckers—an additional recommendation of it, when planted to be eaten in a green state, for horses and cattle, and especially for milch cows; and its time for planting may be so regulated as to furnish a supply of food just when the common pastures usually fail. I am inclined to doubt whether any other green food will afford butter of equal excellence."† The Hon. Josiah Quincy has likewise soiled cattle from Indian corn, sown broad cast, with great success, obtaining, if we recollect rightly, two crops in a season. We cannot say how much seed should be sowed broad cast to an acre. Perhaps between two and three bushels would be sufficient. The author of a "Treatise on Agriculture," published in the Albany Argus, says, that "corn is sometimes cultivated for fodder only, in which case it is generally sown, broad cast, at the rate of ten bushels to the acre, and cut green. In the volcanic soils of Italy, it sometimes produces four green crops in a year." The Massachusetts Agricultural Repository, vol. vi, p. 380, says, "We think the writer must have been mistaken in the quantity of corn sowed broad cast on an acre. We are persuaded that two or three bushels would be ample; better than a larger quantity." When great authorities differ on agricultural points, experiments must decide. We are inclined to the opinion of the author of the Treatise. If fodder alone is the object in sowing Indian corn, we should suppose that it can hardly be sown too thick. The stalks will be smaller, but there

will be more of them, and they will be finer and more easily cured or made into a sort of hay, and we believe would furnish more food for cattle when cut and given green. But this is merely conjecture, as we have never known experiments relating to the subject, though we wish they might be instituted. We have learned, however, from inquiry, that some farmers have been in the habit of sowing Indian corn broad cast, mixed with *cabbage seeds* and oats; and making use of them altogether for soiling, or giving them green to cattle. It will be proper if any of these seeds, or millet, or any of the grasses are sown for the purpose of cutting them green, to harrow and roll the ground perfectly smooth for mowing, as directed in Col. Pickering's remarks on the premiums offered by the Essex Agricultural Society.*

* See N. E. Farmer, page 299.

RECRUITING WORN OUT LANDS.

In this day's paper, page 361, will be seen a detail of an important experiment by a Mr. Lawton, for recruiting a field which had become barren by neglect, or improper management. This experiment seems to have been conducted in a mode analogous to, but in some respects different from what is called *turning in green crops for manure*. The first and second crops of clover, including two years of the experiment, were not ploughed in, but left to rot on the ground. The third year produced a crop which was worth ploughing in. The two first crops were, properly speaking, *smothering crops*. We believe that almost any soil may be made productive by being protected from the rays of the sun, and at the same time exposed to the action of the atmosphere. Every farmer knows that the earth under a wood shed, a dwelling house, or any other building, if the air has free access to it, soon becomes fertile without manure, and even salt petre may be made of it, from nitrous particles, which it must have imbibed exclusively from the atmosphere. It is well worth consideration whether clover, peas, millet, buck wheat, white lupin, or any other crop intended to recruit an exhausted soil, may not as well or better, in many instances, be suffered to rot on the ground, as be turned in. At least it cannot be doubted but more benefit would be derived to a sandy soil from the shade afforded by a small crop, than from the manure such crop might afford by ploughing it in. But if the object of the farmer in sowing his land is either to shade it, manure it, or to cut the crop for soiling, or giving green to cattle, he can hardly be too liberal of the seed applied.

DAVIS' PLOUGH.

An experiment was made on Saturday last, in the presence of many citizens, on one of the vacant squares of this city, to test the value of the *Substratum Plough*, of which Gideon Davis is the Inventor and Proprietor. From so limited an experiment, a conclusive opinion could not be formed; but the impressions of those who understand the subject appeared to be de-

cidedly favorable to the plough as an important implement for pulverizing the earth far beyond the ordinary depth of the plough, and as particularly adapted to put ground in the best condition for Indian corn and all root crops. This plough stirs the ground to the depth of from ten to eighteen inches—the average depth of its running being probably over twelve inches. Some idea of the value of the Invention may be gathered from this fact.—*Nat. Intelligencer*.

HEAD ACHES AND APOPLEXY.

From a Medical work entitled 'Farmer on Head Aches.'

The alarming increase of apoplectic fits for several years past, has naturally given rise to the question, What do they proceed from? Various opinions have been given by writers on the subject, but none appear to be satisfactory.

Now, from all the consideration I have given to the subject, and coupling it with many corroborative circumstances, I find no hesitation in coming to the conclusion, that the prevalence of apoplexy is owing, in a great measure, to the introduction of the custom of wearing cravats. This observation will appear less extraordinary, when we call to mind the fact that this addition to our dress was not adopted until the 16th century, previous to which period the disorder in question was met with but as one to three compared to the present. In that day the neck was divested of every kind of covering, except a slight frill which contained no warmth, and instead of detracting from dignity, it added much to the majesty of the countenance. A mere shirt collar was worn on the neck by some people, but it did not operate in augmenting vascular action there.

But I find another proof of the feasibility of my remarks, by the circumstance of females being less liable to apoplexy than the opposite sex, although the nature of their economy might be supposed to lead much oftener to the complaint. Now we find that their necks are not enveloped in padded ligatures, and consequently the proportion of sudden deaths amongst them is much less than in men.

FOREIGN.

FROM FRANCE AND SPAIN.

Bordeaux and Cadiz papers to the 25th of April, have been received in New York and this city. By these we learn that the royalist Gen. Morales had been taken in an action at Carreja. The government of Spain had officially declared war against France, and had ordered out many public and private vessels against the commerce of the invading country. Tranquillity prevailed at Madrid, but the spirit and enthusiasm of the Spanish people had not abated. The French army was making a slow and cautious progress towards Madrid, and according to their own accounts preserve excellent discipline, but the Spanish say that they commit great excesses. The national troops have fought bravely in the Province of Bilbao, but retreated before the superior numbers of their opponents. The French have levied, according to their own statements, a contribution of 400 suits of clothes on Bilbao. The Spaniards say that the contribution was 8000 dollars. At Madrid preparations were making for giving the French such a reception as may make them repent of their temerity in undertaking to dragoon their neighbors into despotism. The guerille or partizan bands of Spaniards have begun their operations with much vigor. The militia of Saragossa have volunteered their services during the war, and a band of Royalist troops, consisting of 2000, have been completely beaten at Santiague.

Logrono.—The capture of this city is announced in an official despatch from the French General, in which

* Bordley's Husbandry.

† Hon. T. Pickering's Address to the Essex Agricultural Society.

he says, "the enemy made an orderly retreat for nearly a league, defending every position, but were at last broken by the intrepidity of Col. Muller, who threw himself with his hussars into the midst of them, shouting 'long live the king,' &c. The result of this brilliant affair is the capture of Gen. Don Julian Sanchez, 64 officers and soldiers, one standard, several lances, 200 or 300 muskets, &c. and about 30 killed. In short, the Spaniards appear to be pursuing the policy by which Bonaparte was beaten, and which, if persevered in, cannot fail to prove fatal to their assailants in this instance.

LATER STILL.—An arrival at N. York has brought London papers to the 28th of April. An official bulletin from the army of the Eastern Pyrenees, dated 18th April, announces that the 5th division of the fourth corps had advanced to Janquera without meeting the enemy. A French paper estimates the whole force invading Spain at 81,000;—60,000 on the side of Bayonne, and 21,000 under Moncey, at Perpignan. Of the former, more than 30,000 will be necessary for the investment of St. Sebastian and Pampeluna. Sir Robert Wilson, accompanied by a son of Lord Erskine, has left London for Falmouth, to embark for Vigo and join the Spanish army. Some of the French papers state that the Duke d'Angonleme offered the Governor of San Sebastian a bribe of 100,000 francs to surrender the fortress, which he accepted, and having obtained the cash, when the French troops advanced, fired upon them, and killed about 860. The money received was immediately sent to the Cortes. The prisoners taken at Logrono were about 150. Accounts from Portugal state that the insurgents are giving way on every side, and the constitutional forces would soon extirpate the rebellion. The French government is said to have taken great offence at the proceedings in the British Parliament and the neutral course of England. Every thing on the part of the Spaniards indicates determined but wary opposition; and clouds and thick darkness are already resting on the prospects of the invaders.

Two regiments of *women* (says a Perpignan paper,) have been organized at Barcelona, for the service of the place, in case of siege. We hold in our hands an engraving of these soldiers—they are in a becoming dress, and armed with a lance. It may be recollected that in the former war a similar battalion was formed at Gironne, whose courage is much spoken of by Marshall St. Cyr, in his work on Catalonia.

Spanish Main.—The Columbian forces under Montilla have captured the fortress of San Carlos and city of Maracaibo. A division of Morales' army, 6000 strong, under Col. Gomez, had been defeated by the Colombian troops, under Gen. Gonsalvez, and the Spanish Governor of Coro and many others killed. Bolivar was at Guayaquil in March, and had withdrawn the succors furnished by Colombia for Peru, not being wanted, and had changed the destination of the force, 8,000 men, for Santa Martha, and if necessary for Maracaibo.

The last accounts from La Vera Cruz state that the Ex-Emperor Iturbide, with his family, was about embarking for Leghorn, in a British vessel, and that the Mexican Government had agreed to allow him 25,000 dollars per annum, during life.

The New (London) Monthly Magazine for April, says, "We have long and anxiously looked towards the press of America for a sound and sincere history of man in his savage state. Europe in fact has a right to look to America for such a history."

DOMESTIC.

Flood of the Mississippi.—Much damage has been done, and much more is apprehended, from the extraordinary height of water in the Mississippi and its tributary streams. The Louisiana Gazette of the 13th ult. speaks of a freshet in the river Pascagoula, and the streams entering therein, which carried away all the mills in that part of the country, besides doing other damage. An article dated Baton Rouge, May 10th, declares that "the state of the Mississippi at this time becomes really alarming; it rises from an inch to an inch and an half every twenty-four hours, and by the latest accounts, which are far from being satisfactory, we are informed that the Missouri freshet is daily ex-

pected. This is an uncommonly distressing season in every point of view—mercantile business is at a stand—the price of cotton low, and without demand—cash scarcer than ever before known in this part of the world—inconstant rains for a certain length of time latterly, have nearly destroyed the new planted crops, and the unusual swelling of the river threatens to blast all hopes which might have been entertained of remedying the evil." At New Orleans, likewise, great apprehensions were entertained for the safety of the embankments. On the 11th ult. the river ran over into Levee street, and it was feared that a general inundation would soon take place.

The Secretary of the Commissioners under the Florida treaty, has given notice that he will answer the inquiries of any claimant with regard to his individual claim, whenever addressed by letter.

The New York American states, as a report, that Return J. Meigs has been removed from the situation of Postmaster General, and Mr. McLeod, of Ohio, formerly in Congress, appointed in his stead. The editors say they have reason to think the report well founded; but the National Intelligencer is silent on the subject.

A hail storm was experienced at Lynn and Saugus on Thursday afternoon of last week, and several panes of glass were broken. At Lynnfield, several barns were blown down, fences destroyed, and trees torn up by the roots.

A writer in the Richmond Compiler offers an extract from the European Magazine of 1811, giving a statement of the number of men employed by Napoleon to subjugate Spain. The grand total was five hundred and fourteen thousand, seven hundred and ninety-six. These men were hearty in the cause, and were commanded by able generals. They fought for four years, and were finally unsuccessful. What can now be expected from 100,000 men, going reluctantly to battle, and led on by incompetent officers?

An Albany paper of June 4, says—Notwithstanding the large quantity of flour which is daily brought to this market, the price of wheat has been looking up for some time past, and is now from 11s. to 11s. and 3d. per bushel, and we should not be surprised to see the first quality bringing 11s. 6d. or 12s. Winter grain, we are told, in general, looks well, and promises an abundant harvest.

Oranges have been introduced into the Penitentiary, Millbank, (Eng.) as a substitute in the regimen of the prisoners, and the most salutary effects have been experienced from their use. The prisoners are allowed daily, a quarter of a pound of meat and three oranges in addition to the former allowance of soup.

MASSACHUSETTS LEGISLATURE.

But little business of great general interest has been completed in either House, except what related to the usual routine of organizing the government, the details of which we have already published. The following is a list of the bills which have passed their final stages, so far as they have yet fallen within our notice.

To incorporate the Canal Manufacturing Co.—additional, for incorporating the Charlestown Bleachery—to authorize the Trustees of the Baptist Education Fund to divide the same—to incorporate the Trustees of the Ministerial Fund of the Baptist Society in Haverhill—the Leicester Manufacturing Co.—the Trustees of the Ministerial Fund of the first Congregational Society in Wendell—in addition to an act entitled an act to incorporate the Proprietors of the Museum Hall in the town of Boston—in addition to an act entitled an act to incorporate the Union Marine Insurance Co. and the several acts in addition thereto—to incorporate the Elliot Manufacturing Co.—in addition to an act entitled an act to incorporate the Linen and Duck Manufacturing Co.—to cede to the United States the jurisdiction of a site for a Light House on Monamoy Point—in addition to an act entitled an act to incorporate the President, Directors & Co. of the Exchange Bank—in addition to an act entitled an act to provide for the discharge of Officers in the Militia.

A resolve passed authorising the Treasurer to borrow \$50,000.

AGRICULTURAL ESTABLISHMENT,

NO. 20, MERCHANTS' ROW,

(At the East End of the Old Market.)

FOR sale as above, a variety of the most approved single and double mould board Ploughs, C. Howard's improved cast iron mould board, with wrought Shear and Coulters, Cast iron do. do. do. J. Seaver & Co's. do. do. Bigelow's wrought do. do. Warren's much approved common Ploughs, Sinclair's side hill do. do. do. Howard's much improved Cultivator, an implement highly esteemed for its utility in drill cultivation, Bennet's Broad Cast, Seed Sowing Machines, for large and small seeds, Eastman's improved Straw Cutter, Safford's new invented Straw Cutter, much improved, Common hand Straw Cutters, An English Vegetable Cutter, Stevens' patent steel spring Hay and Manure Forks, Steel spring Potatoe Hoes, English cast steel broad Hoes, Common and steel do. do.

A great variety of Garden and other Agricultural Implements. June 7.

AN ODE,

Written for the Celebration of the Second Centennial
Anniversary of the Settlement of N. H.

Two Hundred Years are number'd now,
Since with the op'ning year
The white man breath'd his ardent vow.
And rais'd his altar here;
From Albion's haughty sea-girt land,
"Laconia's" Ancients come,
A patient, firm, and dauntless band,
To seek a peaceful home.

And why should thus our Fathers spurn
Their native earth and sky?
With visions bold their fancies burn;
Their hopes and hearts beat high;
For mid these northern wilds they see
Perennial nature bloom,
And rivers roll in majesty,
To fertilize their home:

And mighty lakes are spreading there,
Where Eden islands show,
And "chrystal hills" are swelling fair.
Where mines of treasure glow;
Oh, at those visions never smile,—
They gild'd well the gloom;
They soften'd oft the rugged toil
That rais'd our happy home.

Nor think such dreams were fables vain.
The moral we may find;
Though winter here in rigor reign,
No frost can blight the *Mind*.
It glows as pure, it soars as light
As ocean's wintry foam;
It is the *Freeman's* Chrystal bright—
The Gem that gilds his home.

Then polish high the living *Mind*!
'Twas Athens' noblest praise—
Be Learning here with Labor join'd,
Our laurels with our lays;
And God, who saw with tender care
Our Pilgrim Fathers roam,
Will bless those sons and daughters fair,
That grace and guard their home.

HAIL THE DAY.

TUNE—*Scots wha hae.*

[Sung after dinner at the Centennial Celebration.]

Hail the day our gallant sires,
On these rocks first lit their fires,
Where now stand our fanes and spires,
On this jubilee—
Sires, who from old England bore
Freedom's standard to our shore,
May your deeds for ever more
Live in memory.

While New Hampshire's healthful gales,
Ocean whiten'd with her sails,
While our verdant hills and vales
Cheer us gratefully;
We'll revere the patriot band,
Men, who on this desert strand,
Wav'd their banner o'er our land—
Flag of liberty.

On the spot where pilgrims fled,
Where by savage foes they bled,
To the spirits of the dead,
This our oath shall be;
By the mounds their ashes made,
By the altars where they pray'd,
By our own right arm and blade,
Still we will be free.

From a Fayetteville (N. C.) paper of May 26.

HYSON TEA.

The fact has been demonstrated, that the
genuine Hyson Tea may be successfully culti-
vated in this State. The experiment has been
conducted with the most satisfac-
tory result. The wife of Mr. J. Newland, of
Fayetteville, found a seed much resembling

that of buckwheat, in the bottom of a box of
tea, which her husband had purchased in this
town. She planted the seed in her garden,
and the produce was a plentiful crop. She
gave some of the seed to Mrs. Farrington, the
lady of Mr. John Farrington, of Chatham coun-
ty, who also planted the seed; and the writer
of this article obtained his information from
Mrs. Farrington, and also obtained from her
some of the tea and seed. He planted the seed
in his garden in this town, where it can be seen
by those who are curious to witness the pro-
ducts of the East Indies transferred to this west-
ern hemisphere. The writer of this article
has distributed, of the small portion of the seed
obtained by him, to many of his friends in this
town and its vicinity. A treatise on the mode
of curing this valuable plant is quite desirable.

From Silliman's Journal.

SALEM MANUFACTURE OF ALUM.

We contemplate with particular satisfaction
every advance made in our domestic arts and
manufactures, and regard every new step of
this kind as an addition to our national resources.

Excepting the natural alum of the caverns in
Tennessee, and of some other regions of the
West and South, and that occasionally found in
our schistose rocks, and used in these cases
more or less for domestic dyeing, and other
purposes, we were not aware that the United
States possessed any resource for this article
independent of the foreign markets.

Some time since we were informed that a
manufactory was established at Salem in Massa-
chusetts, and the proprietors have recently put
us in possession of specimens, which prove that
the effort has been completely successful.

Among the crystals of alum, are some of
great size, and exquisite beauty and transpar-
ency, exhibiting to the naked eye, in a very
striking manner, the successive layers of super-
position, and the progressive increments and
decrements. A part of an octaedron lies before
us, complete, except on the side where it ad-
hered to the mass. It measures nearly five
inches by four, and has the most perfect finish
on its faces and solid edges and angles, which
are in every part replaced by truncations.—
Some crystals of rather smaller size are quite
or nearly perfect. We are aware that fine
crystals are not rare in manufactories, but we
have not seen these equalled even by the simi-
lar productions of the celebrated establishment
near Glasgow. There can be no question from
the appearance of these crystals, as well as
from that of the amorphous masses, of the ex-
treme purity of these materials. Perhaps they
are even purer for this reason, that the alum is
not manufactured (as we understand) from the
usual source, namely, the decomposed alum
slates, but from the direct synthetical union of
sulphuric acid with the argillaceous earth.

The sulphate of copper (blue vitriol) made
at this establishment, is equally perfect in its
kind, presenting crystals of extreme finish and
beauty.

From the American Farmer.

CURE FOR THE GRAVEL.

MR. SKINNER—When we take a daily paper
in hand, it is generally for the purpose of dis-
cussing the politics of the day, or noting the
price of stocks: both pass away as the Ephem-

era. But when in company with the *American
Farmer*, "we read, mark, learn, and inwardly
digest" its valuable communications. I often
copy receipts from it, and am inclined to mea-
sure "other people's corn by my own bushel,"
and think the following receipt may be of as
much service to suffering humanity, as one for
making the *Hamburgh* pickle. Should you be
of the same way of thinking, it will find a place
in your valuable paper.

Having been much troubled with the gravel,
I was advised by a Mr. Zane, of this city, to try
a decoction of wild carrot, *Daucus Carota*. I
made a tea from the stalks and seed, with a few
water melon seed, and drank about a quart a
day; it is as palatable as China tea, when
sweetened with honey or sugar. In less than
a month from my first using it, I passed a stone
2-8ths of an inch long and 3-8ths circumference,
of an egg-like form. I have ever since, when
troubled with any pain in the region of the
kidneys, taken a strong tea of it for my common
drink, through the day, and always found relief.
I take it with my children for breakfast, once a
week—they make no objection to the taste.

This is a remedy that is to be found by every
farmer on his own lands; and cannot well be
mistaken, from its great resemblance to the
culinary carrot seed and flower. Mr. Casey,
Seedsman, called to my recollection, a medicine
used by my father, composed of beards of leeks,
birch barks, pennyroyal and wild carrot—ad-
libitum—but a compound is not so easily pro-
cured as a simple, which alone, often causes
the receipt to be passed over.

Yours respectfully,

WASHINGTON SPENCER.

May 18th, 1823.

Lord North.—While this gentleman was en-
gaged in discussing one of the most serious
points of a question under examination, a dog
which had concealed himself under the table of
the House of Commons, made his escape, and
ran directly across the floor, setting up at the
same time a violent howl. It occasioned a burst
of laughter, and might have disconcerted an or-
dinary man. But he who knew how to convert
the most awkward occurrences to purposes of
advantage, having waited till the roar had sub-
sided, and preserving all his gravity, said to
the speaker, "Sir, I have been interrupted by
a new member, not acquainted with the forms
of the house. I therefore yielded to him; but
as he has concluded his argument I shall re-
sume mine."

A dandy, remarking one summer day, that
the weather was so excessively hot, that when
he put his head into a basin of water, it fairly
boiled, received for reply, "Then, sir, you
had *calf heads' soup* at very little expense."

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS
per annum, payable at the end of the year—but those
who pay within sixty days from the time of subscribing
will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the
discretion of the Publisher) until arrearages are paid.

Complete files from the commencement of the
paper in August can be furnished.

Agents who procure seven subscribers, and be-
come responsible for the payment, will be entitled to a
copy gratis, and in the same proportion for a larger
number.

No. 47.

FACTS AND OBSERVATIONS RELATING TO AGRICULTURE & DOMESTIC ECONOMY.

BY THE EDITOR.

BARNs AND BARN FLOORS.

We have given, page 361, some remarks on this subject; but the following additional observations may perhaps be useful.

In constructing the floors of barns, care should be taken that they be made firm, dry, and solid, affording no place of refuge for reptiles, small animals, &c. To effect this purpose, it is recommended that the surface of the ground under the floor should be dug away to the depth of about six inches, and the earth taken out, when of a proper kind, and, after being well cleared of stones, be mixed with clay and made into a stiff mortar, which as it cracks in drying is beaten down till it becomes solid.

The ancients were remarkably careful in the construction of their threshing floors. Columella states that they used to dig up the ground to some depth in order to moisten it with fresh lees of oil, but not with any that had saline matters in them; then to mix it thoroughly with chaff, and ram it down as close as possible; afterwards as it dried, to stop all the cracks and crevices that appeared, they continued beating it down with great force to render it quite level. They then strewed it again with chaff, which they trod in, and left it to be completely dried by the sun. The lees of oil were probably intended to preserve the floors from dampness, which is a great advantage. Rees' Cyclopaedia observes that "a floor made in this manner, though not good, was probably preferable to either stone or the earthen floors formerly common in many parts of this country, from which such dampness has been communicated to the grain, as has rendered wheat, for example, sixpence or a shilling a bushel the worse either for keeping or exportation. Bricks, when hard and well made, may form a tolerable floor for many purposes; but from their attracting moisture, are not by any means to be recommended where grain is to remain much on them: and stones are liable to the same objections.

"Wood is much the best for this use. Boarded threshing floors, made of sound, thick, well seasoned planks of oak, are excellent for threshing upon, will last a long time, and may be converted into good floorings for rooms, by planing them down after they become too uneven for the purpose intended.

"There are various ways of laying and constructing barn floors, when made of wood.—The most common method is that of nailing the planks, after their edges have been shot true and well joined, down to wooden sleepers firmly placed on the ground. But in the mid land counties another method is followed, which Mr. Marshall says, is that of first having the floors laid with bricks, and then covering them over with the planks, without any other confinement than having them doweled together, or ploughed and tongued, and their ends let into the sills or walls, placed in the usual manner on each side of the floors. The advantages of this method

of making the floors are, that when the brick work is well executed and made perfectly level, vermin cannot be concealed underneath them, nor damp air be communicated; besides, floors formed in this way are found to wear better than those placed simply on sleepers."

The author of "Letters of Agricola," after condemning the mode in which barn floors have usually been constructed, in Nova Scotia, (which is probably similar to our usual method) gives the following directions for obviating its evils: "After tearing up the planks, and building the foundation round and round, close to the sills, the void should then be filled and packed firm with earth. As there will be a necessity to cut away all the present sleepers or joists, which besides supporting the planks, bind and unite the two sides of the frame, pieces of square timber may be stretched across the whole breadth and at a lower depth, and be secured to the bottom of the sills, either by a mortise, or by driving down an iron bolt. By this means the strength of the frame will be preserved unimpaired, and the operations may proceed without endangering the structure. The earth should then be filled in, till it rises to the level with the present floor, and it should be beaten down with a heavy mallet, till it is completely consolidated. A stratum of clay should next be laid over the whole surface, by which the moisture may be retained and hindered from escaping through the earth." He advises to place the planks, which are to compose this floor, while the clay is yet a little yielding, that they may be imbedded with the greater firmness.

Dr. Deane observes that the threshing floor should be laid on strong and steady sleepers, well supported from beneath; otherwise carting in loads upon it will soon loosen it, and render it unfit for the operation of threshing. It should be well seasoned, and nicely jointed; and care should be taken to keep it very tight. If it should be so open as to let grain or other seeds pass through, the grain will serve to feed and increase vermin. These directions appear to proceed on the supposition that a space is left between the bottom of the floor, and the surface of the ground. Such space however should never be left unless it can be converted to some purpose more useful than that of harboring vermin; as it may be if situated seven or eight or more feet from the ground, according to Mr. Gibson's directions, as given in our paper, page 361. Indeed there are said to be advantages in setting the floor at some distance from the ground, so that it may have some spring or elasticity, which causes the grain to thresh out with more facility. But the mode of placing barn floors practised in some instances which have fallen within our notice, is the very worst which could be devised. We have seen them in many places laid from 6 to 24 inches from the ground, affording a convenient dwelling place for skunks, woodchucks, hedgehogs, cats, puppies, weevils, worms, bugs, and other insects of all known and unknown denominations; rats, mice, chickens, and other poultry; toads, snakes, &c. &c. In this strong hold of noxious and filthy animals and animalcules, all creeping and flying

things which can vex, annoy and plunder the farmer, find a city of refuge, a secure asylum, and hiss or growl defiance to his attempts to dislodge them with a long handled pitch-fork or a pointed sled stake.

Where threshing machines are used, there is less need of large barns than where the flail is the only implement for separating the straw from the grain. Sir John Sinclair says "Nothing can be more absurd than the enormous barns usually attached to all the great farms in England. Grain in the straw keeps infinitely better in the open air than in close barns; it is less apt to be destroyed by vermin, and saves the enormous expense of constructing and repairing great barns. Threshing mills, when generally introduced, will soon prove the absurdity of erecting such unnecessary buildings."

The calculations of Sir John Sinclair, however, are not precisely adapted to our meridian or hemisphere, although perhaps the introduction of threshing machines might have some influence to diminish the size of our barns in certain cases. Judge Peters well observes, that "When the farm becomes productive, it seldom or ever happens that the barn is too large. The most general mistake is, that it is too small; and most commonly the floor is too narrow for treading out crops with horses, or using our simple machines for threshing. In the moist countries of Europe, wherein there are late harvests, stacking is preferred to confining grain in barns, which is said to be injurious, on account of retaining dampness, and promoting mouldiness both in hay and straw. But in our climate, favoring early harvests, with generally fine weather, no such consequences follow, and barns are all essential."

GENERAL CAUTIONS IN COUNTRY COOKERY.

Soups are never to be filled up or have even a drop of water, hot or cold, added; and are never to boil briskly. They are to be long, long over the fire, *simmering* rather than boiling. And all soups having roots or herbs, are to have the meat laid on the bottom of the pan, with a good lump of butter. The herbs and roots being cut small are laid on the meat. It is then *covered close*, and set on a *very slow fire*. This draws out all the virtue of the roots and herbs, and turns out a good gravy, with a fine flavor, from what it would be if the water was put in at first. When the gravy is almost dried up, *then* fill the pan with water; and when it begins to boil, take off the fat.—Never *boil* fish, but only *simmer*, till enough.—Beef quick boiled, is thereby hardened; *simmer* or slow boil it, in not too much water.—Veal and poultry are to be dusted with flour, and put into the kettle in *cold water*. Cover and boil *slow as possible*, skimming the water clean. It is the worst of faults to boil any meat fast.—In baking pies, a *quick oven*, *well closed*, prevents falling of the crust.

Wasteful or indolent people overlook calculation; and too many may think but little of the wholesome and nourishing qualities of food.—But here are well informed and most actively good men, recommending to the world the re-

sults of much inquiry and experience therein. However lightly may be thought of a cent on a single meal of victuals, yet when the sum of a year's meals is calculated, for a person, a family, and a nation, it becomes striking and important. A cent for a meal, amounts to three cents a day.

One person, at three cents a day. dols. 11
saves in the year
One family of five persons 55
A nation of five millions of people 55,000,000

The cent thus saved by the good house-wife, on every plentiful meal of the wholesomest food, would be sufficient for maintaining the most desperate war by the freemen of America, in defence of their country, against the wiles and the violences of the great enlightened world!

Bordley's Husbandry.

FOR THE NEW ENGLAND FARMER.

I have observed in your paper, No. 43, a piece on the science of *Lunism*, signed Daniel Staples, and after a long life of observation would remark that I have never had just cause to accuse the moon of interfering with my farming business, or officiously disclosing my secrets, and that the science of the moon's influence is beyond my feeble comprehension. But if the moon has such a powerful influence, I would advise my fellow citizens to be cautious how they give her just cause of offence, lest she should retaliate, as her place of residence is not within our civil or military jurisdiction.

I believe that the sap or moisture in wood, fermenting and corroding, occasions its rotting; therefore the season when the least of that is in the pores of the wood is the right time to fell it to render the wood most durable, and that opinion is agreeable to what I have formerly written. Neither do I believe from all my observations that the moon has ever interfered with her influence in my orchard, or my time for grafting; yet from the numerous accounts that I have had from people of credit, I have charity to believe that good bearing apple trees have been raised by sticking limbs in the ground. To learn the time or mode thereof, I have tried abundance of experiments, and all in vain. If the limbs that we prune off our best kind of apple trees could by any ready process be made to grow and flourish equal to young trees, it would be the desideratum of every orchardist; and it is most earnestly desired that any gentleman, having a knowledge of a successful mode of this kind, may publish it for the good of the public.

SAMUEL PRESTON.

Stockport, Pa. June 5, 1823.

From the second volume of the Memoirs of the Board of Agriculture of the State of New York.

ON THE APPLICATION OF STABLE MANURES. [By J. BUEL, of Albany.]

The experiments of Arthur Young, and of other practical and scientific farmers, have demonstrated, that animal and vegetable manures, which undergo a complete process of fermentation in the cattle yards, or upon the surface of the ground, lose from 30 to 60 per cent. of their fertilizing properties; and if properly spread, and buried under the soil, that this loss is prevented—and that a decomposition does immediately take place, even of dry straw, sufficient to answer valuable purposes to the first crop. Mr. Young, whose correctness and practical knowl-

edge will not be questioned by any one who knows his biography or his usefulness, measured five equal pieces of ground: upon the first piece he put nothing; on the second he buried dry straw, chopped fine; on the third, straw steeped three hours in fresh urine; on the fourth, straw steeped fifteen hours; and on the fifth, straw steeped three days in like manner. The whole was sowed with barley. The produce of each piece, in grain, and in weight of grain and straw, was as follows:

	Grain.	Weight of grain & straw.
No. 1,	9	- - 48
2,	39	- - 100
3,	50	- - 120
4,	63	- - 130
5,	126	- - 300

This experiment demonstrates two important facts. 1st, that even dry straw, buried under the soil, decomposes, and greatly improves the first crop. 2d, that the urine of animals, which is ordinarily lost to our farmers, is the most fertilizing product of the stable and yard. We have a strong corroboration of the latter in the history of Flemish husbandry. Radcliff, in his report of the agriculture of Flanders, speaks of urine as constituting the most valuable part of the manure used in those highly cultivated provinces. He cites an instance, where the urine of 44 cattle, by the adventitious aid of rape-cake, and the *vidanges* from the privies, manured in the best manner twenty-one English acres per annum. The urine is collected in large cisterns under ground, into which drains lead from the stables, where the cattle are kept winter and summer. Although I do not expect to see this practice of the Flemings imitated by our farmers, yet I hope the narrative of the preceding fact will not be lost upon them. It shows the importance of constructing concave yards for our cattle, which will retain the urine and moisture, until it is absorbed by the straw, husks, stalks, and other vegetable litter of the yard.

It has become a pretty well settled principle among good farmers, that we should never delay applying manure, because it is unfermented or unrotted; but, on the contrary, that they are the most profitably applied before fermentation commences, or while it is in an incipient state. The main object of this essay remains to be considered. To what crops shall we apply them?

The experience of almost every farmer will testify, that, except on very poor soils, they ought not to be applied, in any considerable quantity, to wheat, rye, barley, or any of the small grains. They often cause, in these, a too luxurious growth, and a greater product of straw than of grain. The straw is tender, is subject to the rust and the mildew, and the grain liable to blast—besides, the crop is apt to lodge and spoil, in consequence. Another serious injury is, the propagation of weeds and grasses, the seeds of which are carried out in the manure, and which cannot be extirpated in the growing crop. To apply manures upon the surface of grass lands, unless of a mineral kind, or in the form of a liquid, or impalpable powder, is throwing away one half of their value. And peas and flax do not do well under their first operation. Arthur Young's rule, and it is a good one, is, always to apply your manure to hoeing crops.

These are Indian corn, potatoes, beans, and the whole family of vegetables. These can

bear, and they want, all the gasses which are evolved in the first process of fermentation.—The gasses open the texture of the soil, and render it pervious to heat, air, and light, and impart food to the young plants; and the hoeing process exterminates all useless plants, and renders the ground clean and loose. When applied to the maize crop, the manure should be spread before the last ploughing. The roots of this grain are numerous, extend to a great length and elongate most where there is nutriment and tilth to invite. Placed in the hill, the manure gives a temporary impulse to the growth of the plant, and fails in its benefits when most wanted to the maturing seed. It answers also best when spread, for the succeeding crop, which is always some small grain. These reasons all hold good in regard to spreading manure for the bean crop, whether that is cultivated in hills, drills, or the broadcast method. For potatoes, whose roots do not extend far, the manure is most serviceable, when applied to the hills, or drills.—For ruta baga, mangel wurtzel, cabbage or turnips, its benefits are multiplied when it is placed under the ridges upon which these crops are planted. It renders the recumbent soil light and friable, attracts moisture, and yields an abundance of food where it is alone wanted for the growing crop.

Either of these crops, if manured, leave the ground in good tilth, and free from weeds, and may be followed with advantage by wheat, rye, barley or oats, according to the quality of the soil. The manure, applied in the spring, gives most of the benefits to the small grain crop which it would have done, had it been left to ferment in the yard; and then applied to that in the first instance.

From the Mass. Agricultural Journal, for June 1823.

THE CAROLINA POTATO, OR SWEET POTATO.

This plant is not a potato, though there is a vulgar opinion, that the common potato transplanted to southern regions becomes sweet, and that the sweet potato on being carried to northern climes degenerates into the common potato. The common potato is what the botanists have named a *Solanum*. It is not a running plant. Its native country is probably the high lands of South America—a cold region. It delights in cold seasons, and a moist soil, and it is a fact, that it is drier and more mealy, when raised in such soils, than in dry ones. The best potatoes known are raised in the wet, flat and almost overflowed grounds of Lancashire in England; and in Ireland, so famous for its moisture and verdure, as to have received the appellation of the Emerald Isle. It flourishes admirably in the fogs of Nova Scotia and the lower parts of the state of Maine. The sweet potato has no title to be called the Carolina potato.—It is an exotic, or foreign plant with them. It is a native of tropical regions; has been gradually introduced northerly, like the Lima or Saba, commonly pronounced, Civet bean. The sweet potato is not a *solanum*, but a *convolvulus*; has all the habits of the tribe of the *convolvulus*; it is a running or creeping plant. It never flowers in our country. It is very hardy—is capable of bearing more frost than the common potato, but in wet seasons it is watery and less sweet. It may prove my great zeal, and somewhat theoretical turn, to recommend again the culture of this vegetable in Massachusetts, but

our years experience gives me some right to peak of it *practically*.

I recommend its culture on the following grounds.

First. It will grow and succeed here under ordinary culture.

Secondly. It is very prolific, making as good returns as the common potato.

Thirdly. It is preferred by man, bearing usually a price three times as great with us as the common potato.

Fourthly. It is preferred by all animals of whatever description. Cows and pigs eat it greedily, and even dunghill fowls will attack and consume it in a raw state.

It will produce about 300 bushels to the acre. I have never failed to raise it with success.—The only impediment to its culture is the difficulty of preserving the small tubers or roots; but as soon as it is known that there will be a demand for them, our market will be regularly supplied from New Jersey, where it has been long naturalized. It can be as easily raised as cabbages. This I undertake to affirm.

J. LOWELL.

I would not be supposed to recommend this article except for the culture of the southern and eastern parts of the State, nor even there, except as a cheap luxury.

From the same Publication.

Receipt for destroying Caterpillars, used by the society of christians called Shakers, at Canterbury, New-Hampshire.

"Take equal parts of turpentine, and train oil; apply them by means of a swab fixed on a pole, commence the operation in the spring, we suppose on the first appearance of (nest) when these devouring insects begin to appear, and repeat the operation once a week, till the trees are in blow, and very few will escape with their lives."

Signed F. W. the head of the Family.

We must express our admiration of this receipt, not because of its novelty, for either of the ingredients would be quite sufficient to kill the insects, as will common soap suds from every Monday's wash *most thoroughly*, without train oil or spirits of turpentine; but we admire it, as a specimen of the practice and industry of these citizens. If our farmers would only follow *that part* of the receipt, which requires a *weekly attention*, for three successive weeks, it is immaterial whether they use spirits of turpentine or soap suds, or the brush proposed by Col. Pickering, the evil would be cured at *any rate*.—The great difficulty is the neglect to do *any thing*, till after the Caterpillars have covered the trees with nests. Then the labours of the duggard commence, and *one tree*, (let his receipt be ever so perfect and powerful) will cost as much time and labour as ten trees would have required three weeks sooner. If our farmers would only adopt *that portion* of the receipt, which requires a *weekly attack* on this enemy, the evil would soon cease, and in ten years we should scarce see a caterpillar in the country. By this course continually pursued, we have so much reduced the labour, that we have not one fourth part of the number we had three years ago.—*Editor Journal.*

From the Domestic Encyclopedia.

Use of Sulphur, in destroying Insects on Plants, and its Benefits for Vegetation.

Tie up some flour of sulphur in a piece of muslin or fine linen, and with this the leaves of young shoots of plants should be dusted, or it may be thrown on them by means of a common swansdown puff, or even a dredging-box.

Fresh assurances have repeatedly been received of the powerful influence of sulphur against the whole tribe of insects and worms which infest and prey upon vegetables. Sulphur has also been found to promote the health of plants on which it was sprinkled: and that peach trees, in particular, were remarkably improved by it. It has likewise been observed, that the verdure, and other healthful appearances, were perceptibly increased; for the quantity of new shoots and leaves formed subsequently to the operation, and having no sulphur on their surfaces, served as a comparative index, and pointed out distinctly the accumulation of health.

From the New York Statesman.

THE PHILOSOPHER'S STONE.

If report speaks truth, the wildest dream of the Alchymist has been more than realized by the achievements of science and genius of modern discovery; and if the long sought for philosopher's stone, by which baser substances could be transmitted into gold, has not yet been found, an invention of still greater importance has at length crowned the efforts of American chemists. It has long been known that the diamond, the most precious of all substances, is composed of carbon in its pure state. But although the powers of chemical analysis have been sufficient by repeated experiments clearly to establish this fact; yet the knowledge of it was of no practical importance to the world, because the powers of synthesis, were not co-extensive with those of analysis; and no mode had been devised of imitating nature by uniting the constituents of this precious gem. In other words, the philosopher was able to convert diamonds into carbon; but he was ignorant of the art of converting carbon into diamonds.

If the experiments of Professor Silliman can be relied on, this invaluable desideratum has in part been supplied. The last number of his Journal of Science contains an article on the philosophical instrument called the *Deflagrator*, invented by Professor Hare, of Philadelphia, by which it appears that charcoal, plumbago and anthracite have been fused by the power of that instrument, and transmuted into diamonds. The following extract contains his statement of the result of his experiment:

"On the end of the prepared charcoal and occupying frequently an area of a quarter of an inch or more in diameter, were found numerous globules of perfectly melted matter entirely spherical in their form, having a high vitreous lustre and a great degree of beauty.—Some of them, and generally they were those most remote from the focus, were of a jet black like the most perfect obsidian; others were brown, yellow, and topaz coloured; others still were greyish white, like pearl stones, with the transluence and lustre of porcelain; and others still limpid like flint glass, or in some cases like hyalite or precious opal, but without the iridescence of the latter."

"I detached some of the globules and firmly bedding them in a handle of wood, tried their hardness and firmness; they bore strong pressure without breaking, and easily scratched not only flint glass but window glass, and even the hard green variety which forms the aquafortis bottles. The globules which had acquired this extraordinary hardness, were formed from plumbago, which was so soft that it was perfectly free from resistance when crushed between the thumb and finger."

It is said the globules obtained by these experiments of Professor Silliman are perfectly limpid, and could not be distinguished from portions of diamond; that they cannot be of vitrified earthy substance contained in the plumbago; and that they are as strictly nonconductors of electricity, as the diamond itself. Such striking analogies would seem to leave little doubt of the identity of the two substances.—The artificial gems have the brilliancy and hardness of the natural ones, and are derived from materials containing the constituents of the diamond. But lest we should be deemed too sanguine, we will add Mr. Silliman's own comment on the result of the experiment, and those who are acquainted with his temperament can judge of the degree of confidence to which the discovery is entitled. The Editor of the National Gazette remarks, that the following sentence is characteristic of this eminent chemist's modesty: "It will now probably not be deemed extravagant," says the Journal, "if we conclude that our melted carbonaceous substances approximate very nearly to the condition of diamond."

Should this discovery be fully confirmed, it will form an era in science, and figuratively as well as literally, shed *new lustre* upon our country. The names of Silliman and Hare will be placed on the same roll with that of Franklin, and handed down to future ages, for the admiration of the world. Countries have been bought and sold for a single diamond; and what would be the triumphs of American genius and philosophy, if we could hereafter see domestick manufactories of this article established, and the coal of our markets transmuted into gems, to sparkle on the breast of beauty, taste, and fashion?

POTATO-YEAST, BY KIRBY.

The principles in this, are allied to the preparations for producing Anderson's potato spirit. Kirby recommends the *nealy* sort to be boiled till thoroughly soft; mashed till very smooth; with hot water put to the mash, till of the consistency of beer yeast, and not thicker. To every pound of potatoes add two ounces of coarse sugar or molasses. When but just warm, for every pound of potatoes, stir in two spoonfuls of yeast, and keep it gently warm till done fermenting. He says, a pound of potatoes yield near a quart of yeast, to keep three months; and he directs that the dough be eight hours before it be put to the oven. This shews that the ferment, however sure is slow. I would have the potatoes to be thoroughly *ripe*, and well *sprouted*; for the reasons mentioned under the head of potato spirit.

CABBAGE PLANTS.

Compared cabbages *transplanted*, with others *not once moved*. The *unmoved* grew and were better than the *moved*.—*Bordley's Husbandry.*

ON THE MANAGEMENT OF ORCHARDS.

The zeal which has of late been manifested in effecting more beneficial modes of culture of our annual crops of grain and other vegetables, the science and economy so usefully inculcated and observed in preserving and in applying the multiplied discoveries of the means of stimulating vegetable growth and increase, as well as the spirit of improvement in the general implements of agriculture, cannot fail to advance the interests of the country, and afford a lively gratification to the agriculturist.

There is an object of culture, however, the advantage of which, if not so immediate, or even necessary, yet adds much to the comfort, happiness and wealth of the farmer, and may be considered his proper pride and luxury—the apple tree.

There is a moral consideration, which should induce an attention to this subject, in the opinion held by many, that cider should supersede, and is the best substitute for spirituous liquors.

Taken as a luxury of our table, as furnishing an excellent drink, as it were the wine of our country, or as an article of export, the apple stands foremost in the fruits of New England. It should not be forgotten, that of late, in addition to the usual markets, a very great export has taken place to Europe, and that the flavor of our apple is highly estimated there.

It may be useful to inquire what is the condition of our orchards? are they not in a state of decline? what are the causes? and how to be obviated? But most of all, it will be of great importance, if more attention can be excited to this subject, so as to encourage communications from the experience of our intelligent farmers; or if any hint should be suggested herein, by which, those disposed to add a fruitful orchard to their farms may find aid or encouragement.

As to the state of our orchards, it is believed from a careful inquiry, that in those parts of the Commonwealth longest settled, they are on the decline. Among the causes that have induced this, besides the natural decay of old orchards, and the neglect to set out and bring on new ones, may be mentioned—the desolating canker worm, the caterpillar, and the boring worm, at the root. The blowing down of a vast number in Norfolk and Bristol, particularly in the September gale, in 1815, and the great injury done some years since, by the formation of ice upon trees, whereby they have been overburthened and broken down; all these causes have conspired to diminish the number, more than is at present apprehended.

From experience and observation, it will, it is believed, result, that even though there may be some life and vigor in those trees which were hoisted and propped up; yet they will give but little fruit, and pass into premature decay. The breaking off the great lateral roots is generally a decisive injury to the tree, besides exposing it to blow over, whenever its props become weak, insecure or displaced.

In obviating the evils which beset our trees, the modes are various, and require great labor and application. They are too often abandoned to the canker worm and caterpillar, to the total loss of fruit and foliage. Thus the tree, by putting forth its leaves twice a year in an annual recurrence, becomes exhausted, unhealthy, and is often totally destroyed.

Many preventatives to the ravages of the canker worm have been practised. The use of tar is most frequent and effectual; but as it injures the tree by its heating and binding nature, it would be very desirable for the fertility and vigor of the orchard, if some more easy and less injurious mode could be suggested. As to the caterpillar, whenever the tree is bare of leaves, and the eggs can be discovered and destroyed, which is practicable upon low and small trees, it is most effectual. A flapper is used by some, dipped in fish oil and applied to the nests, but the removal of them by hand, though slow, has, when the caterpillar is in the nest, been of necessity the prevailing practice. It is, to be sure, slow, and it is to be wished a better mode might be suggested.* The injury done by the worm which perforates and bores its way into the centre of young apple trees, threatens great injury, and one of our Trustees (Mr. Prince) has practised a mode of destroying it in the tree, by the insertion of a wire, as described in the last number of this Repository. But it is to be hoped that some application at the rim of the tree, near the root, may be found out, which may prove obnoxious to the insect which deposits the egg, and remove the apprehension and alarm excited by this last enemy. The decay and other injuries mentioned, whether natural or accidental, are such as cannot be guarded against in any considerable degree. The prudence and good management of our farmers will always effect something. If then, our orchards are on the decline from age and other circumstances, and we have been inattentive to bring forward a new growth, would it not be useful to turn our attention to this subject. The value of the fruit should induce the culture of the tree.

The situation for an orchard is well understood by our farmers. It flourishes best in a moist and strong stony soil, where it is not exposed to the wind. It cannot be attempted with success to bring forward an orchard in an old field, a green sward, or an exposed state, to be rubbed against by cattle.

It is, however, more easy than is generally supposed, to overcome many natural disadvantages, and an orchard may be brought forward, and made productive in a few years, in a situation (when wished) not so favorable. To shew this, two cases will be mentioned which have been attended with good success.

In the one, a low piece of strong stony land was taken. As it was rather flat, it was ploughed in strips, or dug in spaces about four feet square. As it was necessary to plough a furrow between each row, the mode of ploughing in strips was found the best, as by turning the furrow towards the tree, the land was better drained. Besides raising the ground a little from the surrounding soil, half a buckload of loam was added to raise the ground on which the tree was set. After this was done, the strips or squares, as the case might be, were appropriated to the culture of potatoes and garden vegetables. In a few places only, the trees failed from the insufficiency of the drain. But by opening the drain and raising the ground, by half a buckload of loam, I found on setting out

a new tree, it flourished equally with the rest. This orchard, now in eight years, is a most valuable one, and most of the trees would give half a barrel of apples.

From this and other circumstances which have fallen within my observation, it appears that low land, if strong and well drained, will give a fine orchard, and probably sooner than any other.

The next effort was made under totally opposite circumstances. The object was, to have an orchard on a particular spot, where the soil was thin and light upon a plain or flat. The holes were dug four feet over. The two upper strata of black and yellow loam were placed aside the tree. After this, about ten inches in depth of the gravelly or poorer earth was taken out and carted off, and a horse-cart load of stones upset into the hole; upon these, a part of the upper stratum, or some dirt from the side of the road was scattered so as to fill up the interstices, since which the spots near the trees have been cultivated, by planting four hills of potatoes round each tree. The result has been tolerably favorable with all. But the trees having the stones placed at the roots have exceedingly outstripped the others.*

From the result it is to be hoped, that in this easy mode, disadvantages may be counteracted and the benefit of a deep soil had for the growth of an orchard near our dwellings, or wherever wished. As to the distance, I incline to less than is general. The best orchards I have seen have been from 25 to 30 feet distance. This is the more important, as the land if fed at all, should only be occasionally cropped a little by horses. Horned cattle, if freely admitted, will soon disappoint all expectation. It will be perceived in the difficulty of raising an orchard, at old and long improved soil is alluded to. In a new soil where the apple tree is introduced, in clearing off the forest, in this part of the country, as well as Upper Canada, they set out a tree which they often defend by upsetting a stump, so as to enclose it between roots, and they have fruit very soon indeed.

The profit of a fine orchard is familiar to our farmers. The fact is well known in this neighborhood, that 160 barrels of apples were gathered a few years since, from less than two acres in the town of Dorchester. This, with the cider made from the refuse apples, and grass, gave about \$300 per acre; an income rarely exceeded in the improvement of soil. I have been minute and particular, from a wish, that others better informed, may be induced to communicate the advantages of their experience. A fine orchard is not only a source of emolument to a farmer, but one of the most beautiful and gratifying objects that can adorn a country.

I am yours,

JOHN WELLES.

* The dimensions of the Trees in the first experiment—a rich, low, black, stony soil, drained, were at the expiration of eight years 15 to 17 inches circumference, one foot from the ground. This may be considered (the tree being small when set out,) as a growth of about two inches a year. The growth in the second experiment for six years, was, 12 to 14 inches in the holes, in which the stones were put one foot from the ground. Where no stones were put, nine inches was the growth. It will thus be perceived, that the vegetation was most powerful under circumstances by nature least favorable. If then, thus much can be done to counteract such disadvantages, it surely offers much encouragement to our efforts, and leads us to hope, that not only in this, but in other objects, they may be beneficially extended.

* The brush recommended by Col. Pickering in a communication published in our paper, page 308, is perhaps as eligible and effectual a remedy against caterpillars as any which can be devised.—*Ed. N. E. F.*

NEW ENGLAND FARMER.

SATURDAY, JUNE 21, 1823.

The Farmer's and Gardener's Remembrancer.

JUNE.

HAY-MAKING.—The best time to cut grass for hay is when the seeds are forming, but before they become fully ripe. It should not be cut too early before it has got its proper growth, because, in such case, it will shrink much in drying, and afford a less solid and nutritious substance. Neither should it be suffered to stand too late, or till the seed be quite ripe. It will not only be harder to cut, but the ripeness of the seed will cause it to shatter out while drying, which will be a loss of some consequence, as the seed is the richest and most nourishing part; and the soil will be the more exhausted by nourishing the seed till it comes to maturity. The only advantage in mowing late arises from the thickening of the grass roots by scattering some of the seeds. But this is a dear mode of sowing grass seeds.

If it is proposed to mow a piece of grass land twice in a season, the first crop should be cut earlier than when it is mowed but once, not only to give a longer time for the growth of the second crop, but to prevent the roots of the grass from being too much exhausted in producing the first crop. When it is proposed to save the seeds of red clover it is particularly important to cut the first crop early, so that the second, from which the seeds are procured, may be the sooner ready for cutting in autumn. In common cases clover should not be mowed till it begins to turn brown; but as the farmer who has many acres in grass cannot cut it all exactly in the best season, he may begin first on that clover from which he expects to gather seed on cutting the second crop, and not wait till it has changed from red to brown. In other cases he should cut the thickest grass, that which is lodged or is in danger of lodging, in the first place. The thinnest should be cut next; and last of all that which is on a medium between thick and thin.

Some regard must be had to the weather in cutting grass for hay, especially if that grass is clover, which requires much attention and favorable circumstances to preserve. If the weather is wet and improper for haying, clover will, we are told, remain standing a fortnight, without sustaining any material injury by the shedding the leaf or the blossom; for the same weather which renders it improper to mow this grass, continues it in a growing state, and prevents the bloom from fading or dying away.

There are various modes of making hay described by authors on husbandry, some of which are too troublesome and expensive to be adopted in this country where labor is scarce. We shall state several methods, and leave it to our readers, either to take their choice of those, or to give the preference to something different of their own invention. The Farmer's Assistant says, "The best plan is, for the farmer to be at his mowing betimes in the morning; cut down as much as possible by nine or ten o'clock, by which time the dew will be off; then spread the mowed grass evenly, and about twelve turn it over where it lies thick; in the afternoon rake it into winrows, shake it up lightly that it may be the better exposed to the air; towards sun down make it into neat small cocks, and let

it remain so a day or two. If it be not then sufficiently dry, shake it out again on a small space of ground, and turn it over till it is dried; then cock it again, if necessary, and as soon afterwards as possible draw it in.

"But in order to save much trouble in drying hay, the application of from four to eight quarts of salt to the ton is recommended. It is found that hay, thus salted, can be well saved in a much greener state, and at the same time the benefit which the hay derives from the salt is more than four-fold its value."

It is observed by Dr. Deane, that, "Were it not for the labor and cost, a good way of hay-making would be, for the hay-makers to follow at the heels of the mowers, at least as soon as the dew is off, and spread the swarths evenly; turn the grass about the middle of the same day; make it up into cocks before night; open the hay, and turn it the next day; and so on till it be sufficiently dried, doubling the cocks if signs of rain appear. It will not commonly take more than two or three days to dry it, unless it be very green, or uncommonly thick and rank."

The practice of the best English, Flemish and French farmers, is to expose the hay as little as possible to the sun. It is carried in dry, but preserves its green color; and hay of two or three years old appears so bright that you would scarcely conceive it to be cured. Yet they preserve it for years, and value it the more for its age. In Scotland "the best managers disapprove of spreading out clover or rye grass hay. The more the swarth is kept unbroken, the hay is the greener and more fragrant."

When the grass is thin, and somewhat dried before it is mowed, it may be cut in the forenoon, and raked in the afternoon of the same day, and by standing two or three days in the cock, will be sufficiently dry, without any further trouble. If rain fall in any considerable quantity, these cocks will require to be opened and exposed to the sun for a few hours. If a small quantity of rain has fallen, it may be enough to pull out some of the hay round the bottoms of the cocks, or only on that side which was to the windward when the rain fell, and lay it on the tops. If the cocks are so situated that the water has run much under their bottoms, they should be turned bottom upwards, and trimmed at least; but it will most commonly be necessary to spread them abroad. When hay becomes too dry it should be carted either in the evening or morning, and when the air is damp.

"A very ingenious gentleman of my acquaintance does not permit his grass to lie in swarth but for an hour or two after it is cut, or no longer than till its wetness be gone, and it just begins to appear withered. He then gathers it into very small parcels, which he calls grass cocks, not more than a good forkfull in each; turns them over once in a while, about sun set is the best time; doubles them as they grow drier; and when the hay is almost dry enough, makes up the whole into large cocks. Grass which is thus dried will not waste at all by crumbling; nor will much of its juices evaporate. I have seen his hay, the flavor of which excelled almost any other that I have met with. The color of it, indeed, was rather yellowish than green, but that is a matter of no conse-

quence to the farmer, who does not send his hay to market. I cannot but think that in dry settled weather, this is an excellent method of hay-making; but in catching weather, perhaps a method which takes less time is to be preferred."* From the above Dr. Anderson's method is not much different. "Instead," says he, "of allowing the hay to lie, as usual in most places, for some days in the swarth, after it is cut, and afterwards putting it up into cocks, and spreading it out, and drying it in the sun, which tends greatly to bleach the hay, exhales its natural juices, and subjects it very much to the danger of getting rain, and thus runs a great risk of being good for little, I make it a general rule, if possible, never to cut my hay but when the grass is quite dry, and then make the gatherers follow close upon the cutters, putting it up immediately into small cocks, about three feet high each when newly put up, always giving each of them a slight kind of thatching, by drawing a few handfuls of hay from the bottom of the cock all around, and laying it lightly on the top, with one of the ends hanging downwards. This is done with the utmost ease and expedition; and when it is once in that state, I consider my hay as in a great measure out of danger; for unless a violent wind should arise immediately after the cocks are made, so as to overturn them, nothing else can hurt the hay; as I have often experienced that no rain, however violent, ever penetrates into these cocks but a very little way. And if they are dry put up they never sit together so closely as to heat, although they acquire in a day or two such a degree of firmness, as to be in no danger of being overturned by wind after that time, unless it blows a hurricane.

"In these cocks I allow the hay to remain until, upon inspection, I judge that it will keep in pretty large tramp cocks, &c. The advantages that attend this method are that it greatly abridges the labor, that it allows the hay to continue almost as green as when it is cut, and preserves it in its natural juices in the greatest perfection: for it is dried in the most slow and equal manner that can be desired. Lastly, that it is thus in a great measure secured from almost the possibility of being damaged by the rain."—*Essays on Agriculture.*

The Farmer's Manual says, "Whenever your clover has sweat and cured in the cock, so that you can select the largest stalks, and twist them like a string, without their emitting any moisture on the surface when twisted, you may then house your clover in its most perfect state. If you sow timothy or herd's grass with your clover, you may manage in this way for the first year with safety—the second year it will become about one half timothy, or herd's grass, and must be spread and turned gently, to preserve as much as possible the heads and leaves of your clover—the third year your clover will disappear, and the herd's grass must be cut and spread in the common mode; I say the common mode, for I presume that every farmer spreads his hay into three swarth winrows, (unless it be heavy English grass, of two or three tons to the acre, which will occupy all the surface of the field on which it grew to cure it;) this saves the expense and trouble of one raking, and that he spreads in the forenoon all the swarths cut before 12 o'clock, (leaving the swarths cut after

*Agricultural Report of Scotland.

*Deane's New England Farmer.

12 o'clock, to continue in swarth until the dew is off the next morning) and that he gets into cocks, before 5 or 6 o'clock in the afternoon, all the hay spread upon his field. The fermentation which hay undergoes by standing in the cock over night, not only sweetens the hay, but prepares it for a more rapid evaporation of its juices the next day, and will doubly pay the expense of cocking, besides the security it affords against bad weather."

The following methods of preventing hay from heating in the mow, are from the publication last above quoted.—"Let your bays be open under the bottom for a free circulation of air; fill several large bags with hay, set them erect upon the floor of your bays; place the hay around them with as little treading as possible; raise up your bags with the rise of your mow, and when your mow is finished, remove the bags: these openings will serve as ventilators, and secure your mows from heating. If you reserve your wheat or rye straw for this purpose, and cover your clover occasionally as you mow it, with straw, your straw will not only prevent your mow from heating, but imbibes the moisture of your clover, and become valuable food for your horses and cattle."

"Salt hay, in this country, has usually been hurt by lying too long in the swarth. The method in which I have treated it for several years, is to cock it the next day after it is cut, and put a layer of some kind of dry straw between load and load of it, in the mow, to prevent its taking damage by over heating. The straw contracts so much of its moisture and saltiness that the cattle will eat it very freely, and the hay is far better than that made in the common way."

The following is from a communication to the Bath and West of England Agricultural Society, made by a gentleman by the name of LEWES TUGWELL, and was published in the 12th volume of the papers of that Society. The volume itself we have not been able to place our hands on, and the Extract and succeeding remarks are obligingly furnished us from the minutes of a gentleman, to whom we have heretofore been indebted for favors connected with the objects of our publication: and whose literary and scientific labors have made valuable additions to the stock of public knowledge in the departments of Agriculture and Domestic Economy.

THE EXTRACT.

"In one corner (of the fire place) is a small stove for a boiler, or steam-kettle; or what would be infinitely preferable, but which, unfortunately, is not known to the lower orders of society, Papin's Digester. This culinary article being capable of raising heat in water to every requisite temperature, by its means may be prepared the most economical soups, Irish stews, bouillies, &c. drawing even from bones (otherwise thrown away) the most nourishing jellies, and extracting from them every nutritive particle."

"I purchased one of Papin's Digesters, at the recommendation of a lady (who from a most emaciated and exhausted state, bordering on consumption, was restored to sound and vigorous health by bone-jelly) and found it merited

every praise she had bestowed on it, producing excellent soups and jellies from materials before thrown away."

"In the other corner is placed an oven made only of one brick in thickness (2½ inches) both at bottom and sides, and not more than one in breadth (4½ inches) on the top; the whole to be bedded and surrounded on all sides, above and below, with four inches of well-rammed wood ashes."—"Wood ashes being a bad conductor of caloric [or matter of heat] and thence keeping in all heat, such oven will not require more than a third part of the fuel usually consumed in the operation of heating. I had once an oven that being surrounded, and in continuity, with very thick walls on every side, and into whose substance the unseen fire [heat] passing in continual progress, it required twenty faggots to heat it! Of this I soon grew tired, and built another as above described, of the same dimensions, and which (the fire [or heat] not being suffered to pass beyond a single brick) would be heated at any time (although divested of previous warmth) with three of such faggots, and generally in about a sixth of the time of the former."

"As small sized ovens are made at the potteries in one entire piece, it would be singularly appropriate to bed them in these ashes, to prevent a migration of their heat beyond their own external parts. The fire place of the above Digester may also be surrounded with the same non-conducting substance."

A few remarks on Mr. Tugwell's statement may perhaps be useful. I suppose the wood-ashes must be made a little damp, to admit of their being "well-rammed." Admitting the non-conducting power of ashes, some might apprehend that the single tier of bricks forming the oven, would be incapable of receiving heat enough to bake a batch of bread; but I have found it sufficient (in a small oven constructed on Tugwell's plan,) thoroughly to bake pan-loaves of rye and Indian meal bread. Consequently it must be abundantly adequate to bake loaves of wheat meal. In constructing the small family oven, after it was formed with a single coat of bricks, I directed the mason to commence laying the exterior coat, leaving a space all round (excepting the mouth, of course) of three or four inches for the ashes; and as he carried up the work, the ashes were filled in, as far as the commencement of the arching, when the whole top of the oven received the coat of ashes; and then the brick work was laid over and completed it. In a word—two ovens were constructed, with three or four inches of rammed and pressed wood ashes in the space between them. The door of the oven was of soap stone, hung by a pair of hinges, shutting close into the rebates (commonly pronounced *rabbets*) of the jambs and head-piece (also of soap stone, which formed the mouth of the oven) and fastened with a latch.

Mr. Tugwell's oven must be singularly well adapted to the use of bakers; and I hope some of them may be induced to make the experiment, and test its efficacy, as stated by him.

A well informed man, who before our revo-

* Dr. Papin, a French physician, published a description of his Digester in 1681; as you may see in *Rees' Cyclopaedia*, article PAPIN. Though not introduced into the kitchen, it appears to be still used in chemical and philosophical experiments.

lution had been a master-baker in Philadelphia, once told me, that a very material portion of the profits of his business, which was extensive, arose from his saving of fuel—for he never suffered his ovens to become cold. That is, batch succeeded batch with so short intervals, that a small quantity of fuel served to raise the requisite heat. And Count Rumford, in his account of the establishment formed under his direction for the poor in Munich, states, that the first heating of the oven took 366 lbs. of dry pine wood. The following batches required less and less; until for the 6th batch 7½ lbs. of wood sufficed; that is about a fifth part of what was necessary for the first.

Massachusetts Agricultural Repository and Journal.

The last number of this valuable publication has just issued from the press of Messrs. Wells & Lilly. We have had time to give it but an imperfect and hasty perusal; but have seen enough to warrant the assertion that its articles are well written, and well selected, and cannot fail to prove profitable, as well as interesting, not only to the practical farmer, but to all who delight in the *Studies of Nature*, and wish to know by what laws her system of economy is regulated.

MASSACHUSETTS LEGISLATURE

Closed its session on the 14th inst. A journal of their proceedings is probably in possession of most of our readers, who would feel an interest in its detail.—There has been but little said, but as much done, perhaps, as the public good requires. The following are the titles of some of the acts, not included in our last:

An act to incorporate the Bunker Hill Monument Association—to continue in force for the term of five years an act entitled an act for the encouragement of Agriculture and Manufactures—to incorporate the Merrimack Manufacturing Company—to incorporate the Boylston Medical Society of Harvard University—to incorporate the Newton Factories—to incorporate the West Boylston Manufacturing Company—for the relief of the Danvers Cotton Factory—to incorporate the Bristol County Agricultural Society—to incorporate the Braintree Manufacturing Company—to incorporate the Mansfield Union Cotton and Wool Manufactory.

FOREIGN.

An arrival at New York has brought advices from London to the 8th of May, which is ten days later than had previously been received. From the French armies in Spain we have accounts to the 30th of April. At that period D'Angoulême's corps remained at Vittoria. The right corps was at Burgos, almost half the distance between the frontier and Madrid. The left, under Marshal Moncey, had advanced some way in Catalonia, and was besieging Figueras; and the centre, under Gen. Molitor, had occupied Saragossa, and was still advancing. There has been but little fighting, and the Spaniards appear to be true to their system of not running the risk of great battles. Marshal Moncey having summoned the Governor of Figueras to surrender that fortress, the latter replied that he and the garrison were resolved to bury themselves under the ruins of the fortress rather than fail in the observance of their honor and their oaths. It has been reported that Russia has determined to take an active part in the war in favor of France, but nothing official on that subject has transpired. The Portuguese insurgents have been subdued or driven out of the kingdom. The Government of Great Britain has determined on preserving its neutrality, and to permit the two hostile nations to settle their disputes without her interference, and this determination has received the approbation of Parliament.

It was reported at Odessa on the 3d of April, that there had been another great fire at Constantinople, near the Seraglio.

RURAL SCENES.

Now summer comes, with flowers and verdure crown'd,
And high luxuriant grass o'er spreads the ground,
The laboring swain, with crooked scythe is seen,
Shaving the surface of the waving green;
Of Flora's mantle he disrobes the land,
And strips the meadows with a sweeping hand;
While with the mounting sun the landscape glows,
The fading herbage round he loosely throws.
To catch the ardor of the scorching rays,
Which Sol emits in fierce meridian blaze.
But, if some sign portends th' untimely shower,
The rustic prophet sees the threatening hour;
His sun-burnt hands the scythe and fork forsake,
And spotless nymphs may now embrace—a rake!
In petty mounds the fragrant harvest grows,
And spreads along the fields in lengthen'd rows.

Now when the height of heav'n bright Phoebus gains,
And pours a flood of glory o'er the plains;
When panting cattle seek the cooling lake,
And in the sultry pathway basks the snake;
O lead me, guard me from the burning hours,
Hide me, ye forests, in your closest bowers,
Where oaks majestic, branching arms entwine,
With beech and birch and evergreens combine,—
Spread parasols betwixt the earth and heaven,
And make at noon an artificial even—
Where flows the brawling brooks, for poet's themes
And waving ivies overhang the streams,
Stretch'd on a mossy couch give me repose,
Sweet sleep, which sloth or luxury never knows.

INSTANCE OF LONGEVITY.

Communicated in a letter to one of the Editors by JOHN M. HUNT, Esq. of Dunstable.

Respecting old Mr. Lovewell, I have not been able to procure much information relative to his life and character; however, if we may rely on tradition, the following succinct account may be considered pretty correct. ZACCHÆUS LOVEWELL, of Dunstable, who lived to the remarkable age of one hundred and twenty years, was a native of England. He had the honor of serving as an Ensign in the army of Oliver Cromwell, the Protector, and, upon the overthrow of the Commonwealth, and the accession of Charles II. to the throne of his unfortunate father, he left his native country, emigrated to New-England, and settled somewhere in this vicinity. In the disturbances which so frequently armed the early settlers of this country against the savages of the wilderness, in which the offspring of Mr. Lovewell bore such honorable parts and acquired so many laurels, he remained an idle spectator, always maintaining the strictest neutrality. In his conversations with the Indians, they frequently told him of the many opportunities they had of taking his life, while lying concealed in ambush, but on account of his great friendship for them, together with the circumstance of his having white hair (for which scalps the French government paid no bounty) they never molested him. Not much is known respecting his family, excepting his three sons, who were all distinguished men, and worthy the remembrance of their countrymen. Zacchæus was a colonel, and is mentioned by Dr. Belknap; Jonathan was known as a minister, representative and judge; and John was the celebrated hero of Pequawckett.

Dunstable, May 23, 1823

AUTHENTIC ANECDOTE.

Communicated by Dr. ISAAC STEARNS, of Dunbarton.

Capt. Caleb Page and Robert Hogg were among the first inhabitants of Dunbarton, and experienced all the privations, hard-ships, and fears, attendant on settlers of a new country.—Page removed from Atkinson; was somewhat above the generality of first settlers as to property; and withal was a very liberal spirited man, imparting his advice and assistance to his neighbors on many occasions. Hogg came from Ireland; was poor, ignorant of the customs of the country, and of the art of husbandry; but he had a good education for that time, and was often employed to instruct the children of his neighbors, by which means he obtained the appellation of *master*. An anecdote is related of these two men characteristic of the cordiality and friendship that subsisted among the early settlers of our country, and which was not suffered to be embittered by the most severe jests. Hogg, wishing to plant some potatoes, and having understood that people used manure to increase their growth, applied to Capt. Page to know what he must use, as he had no manure. Page told him that rotten hemlock would answer every purpose as a substitute. He accordingly applied a shovel full to each hill. The heat and dryness of this substance was such that it prevented the potatoes from vegetating. Being asked a few weeks after how his potatoes looked, Hogg replied, "They have denied the resurrection, for not one of them has come up." Mr. Hogg, however, soon found out the joke that had been put upon him, and without any ill-will waited for an opportunity to retaliate in his own way. Being sent to by Page for tobacco plants, he sent him a quantity of young mulens, which, when young, bear a great resemblance to tobacco plants. Page had them very carefully set out, when lo! instead of tobacco, he raised a fine crop of *mulens*. At harvest-time, Page ordered his men to fill a cart body full of potatoes and take over to neighbor Hogg; this was accordingly done. Master Hogg likewise, sent Page a large roll of *home* raised tobacco.—*ibid*.

ANIMAL INSTINCT.

In the "Introduction to Entomology," by Kirby & Spence, vol. ii, p. 502, the following very remarkable instance of the power of discovering home, exhibited by an ass, is communicated on the authority of Lieut. Alderman, of the royal engineers, who was personally acquainted with the facts.

"In March, 1816, an ass, the property of Capt. Dundas, of the royal navy, then at Malta, was shipped on board the *Ister* frigate, Capt. Forrest, bound from Gibraltar for that island. The vessel having struck on some sands off Point de Gat, at some distance from the shore, the ass was thrown overboard to give it an opportunity of swimming to land; a poor one, for the sea was running so high, that a boat which left the ship was lost. A few days afterwards, however, when the gates of Gibraltar were opened in the morning, the ass presented himself for admittance, and proceeded to the stable of Mr. Weeks, a merchant, which he had formerly occupied, to the no small surprise of this gentleman, who imagined that, from some accident, the animal had never been shipped on board the *Ister*. On the return of this vessel

to repair, the mystery was explained; and it turned out, that Valiante (as the ass was called) had not only swam safely to shore, but, without guide, compass, or travelling map, had found his way from Point de Gat to Gibraltar, a distance of more than two hundred miles, through a mountainous and intricate country, intersected by streams, which he had never traversed before, and in so short a period, that he could not have made one false turn. His not having been stopped on the road, was attributed to the circumstance of his having been formerly used to whip criminals upon, which was indicated to the peasants, who have a superstitious horror of such asses, by the holes in his ears, to which the persons flogged were tied."

CATERPILLARS.

The following paragraph is from the Woodstock (Vt.) Observer, of June 10th.

"Many of the orchards in this vicinity are suffering from the visitation of caterpillars.—These vermin infest the apple, plum, cherry and other fruit trees, in some instances building their nests upon them, and in others assailing them in companies, devouring the leaves and then quitting them. A similar species of worm preyed upon the trees on the west side of the mountain last season. There it is said the caterpillar travelled in a direct line, destroying the orchards that fell in their way. As a preventive, it is recommended to put upon the tree circle of tar, which will prevent the ascent of the caterpillar, and preserve the foliage on trees where the worm is not bred."

Simplicity and Integrity of the Swiss Mountaineer.

A peasant named Frantz, came one evening to look for Gasper who was mowing a meadow and said, "My friend, this is my harvest; thou knowest we have a dispute about this meadow, we know not to whom it properly belongs; I decide this question, I have collected the judges at Schwitz; come then tomorrow with me before them." "Thou seest Frantz, that I have mowed the meadow, I cannot be absent." "Art thou not sending away the judges, who have fixed on this day; indeed we should have known to whom it belonged before it was mown." The had some little controversy on the subject; but at last Gasper said, "I will tell thee what thou shalt do. Go tomorrow to Schwitz; give thy judges my reasons and thine; and I shall save the trouble of going myself." On this agreement Frantz went to plead for and against himself, and threw out the reasons on both sides as well as he could. When the judges had decided, he went to Gaspar: "The meadow is thine—the sentence is in thy favor."

People the earth with such men, and happiness will dwell there!

THE MILLER AND PAINTER.

A miller at P—, who lately quitted his mill to keep a public house, sent for a painter to paint him a sign, which he would have the miller—"I must have the miller looking out of the window." "It shall be done," said the painter.—"But as I never seem to be idle, you must make him pop in his head if any one look at him. This also the painter promised, and brought home the sign. "It is well done, but where is the miller?" "Oh," says the painter, "he popped in his head when you looked."

NEW ENGLAND FARMER.

PUBLISHED BY THOMAS W. SHEPARD, FOGERS' BUILDINGS, CONGRESS STREET, (FOURTH DOOR FROM STATE STREET.)

Vol. I.

BOSTON, SATURDAY, JUNE 28, 1823.

No. 43.

From the Mass. Agricultural Journal, for June.

THE MODE OF MAKING CIDER ADOPTED BY THE RELIGIOUS SOCIETY AT CANTERBURY, NEW-HAMPSHIRE, COMMONLY CALLED SHAKERS.

[It is with great pleasure we insert this article, not only on account of its intrinsic merits, which are great, having all the clearness, precision, and simplicity which you would expect from men so well skilled, and who make the best cider (it is said) in New-England, and who, in every thing they undertake are eminently successful; but because it gives us an opportunity of making of the admirable example set by this description of persons in all that relates to agriculture, horticulture, and manufactures. With their peculiar tenet of ceremonies, an agricultural work has no concern; it is its province to recommend excellent examples, neatness in cultivation, and in care, and caution, and fidelity in manufacturing articles important to the farmer. It will not be questioned, that the Shakers have a most praise-worthy example—not of industry, society, and neatness merely, but of exactitude. They undertake nothing in which they do not succeed better than their neighbours; and the secret of their success will be found to consist in their system of order, and the thorough and effectual manner in which every thing is performed. It is highly probable, that this (should it continue to maintain its ground) will finally furnish the states in which they live, with the best and purest seeds, with the neatest and most faithfully manufactured implements. We hope, that other sects of christians will shew, that there is nothing peculiar in the opinions of the Shakers which should preclude of necessity these happy and honourable results, at that they will all strive to "have every thing performed decently and in order." We hope to be able to reply to the queries of the Shakers, as to the manufacture of wood, or rather its preparation from the leaf, or the immediate use of the dyer. They will be pleased with the letters on that subject, of Gen. Dearborn, and Mr. Crowninshield.]—*Ed. of the Mass. Agr. Rep.*

To John Prince, Esq. Treasurer of the Massachusetts Agricultural Society.

CANTERBURY, March 24, 1823.

Much respected Friend Prince,

I recently received your very liberal and worthy favor of the 22d ult. for which I feel a grateful acknowledgment, and hope to make you some compensation whenever you call on us again. We were very glad to hear of your safe return home.

The No. of the Journal containing Gen. Dearborn's letter on wood, we have had; but our clothier having cultivated this plant the last season with success, is now in quest of information how to manufacture and prepare it for use. He has respect to a treatise to which the General's letter refers.

As to experiments and improvements to communicate to the Agricultural Society, be assured we feel much indebted to you, and also to Esq. John L. Sullivan, for your liberality, and should be willing to communicate any thing in our power, that would be beneficial to mankind; but as our minds are not so intent on moral and external things as on an interest in Christ, and as our agricultural pursuits and improvements are so small and simple, we consider ourselves inadequate to say much on that subject.

However, there are two or three small improvements we shall mention for your consideration, having been under our experience for some years; and which we find to be beneficial to us, and from which, if you and others can

derive the same benefit, we shall feel ourselves amply rewarded for giving the following hints.

1st. The process in making and refining cider in order to have it good and wholesome, is so simple, (though important) that many people entirely overlook it, supposing the mystery so deep, as to be entirely out of their reach; and others, perhaps, tenacious of the customs of their forefathers, shut their eyes and ears to any improvement, however propitious to their interest and comfort; such will probably be contented to smack over their ill-flavored and unwholesome beverage through life.

Now, friend Prince, if we should explain what we know respecting the management of cider, some people would laugh, and say they did that and a great deal more; and I suspect they do, and add many more ingredients, such as water, pomace, and rotten fruit; and perhaps something more from fowls, beasts, and vermin, none of which makes the cider any better.

We shall not hesitate to give it as our decided opinion, that cool climates are much more favourable to cider than warm. However, what greatly contributes to the goodness and delicacy of cider, is the cleanliness of the casks which contain it. In fine, all utensils used in making cider, should be kept clean, and not suffered to get sour through the whole process; even the press should be frequently rinsed down, during the time of making cider, to prevent sourness or a change in the cider.

To clean casks which have been used for cider, we take them from the cellar as soon as convenient after the cider is out, (reserving the lees for stilling) and rinse each clean, first with a pailfull of scalding water, then with cold. Leaving the casks with the bungs down for a day or two, or till dry. Then we bung them tight, and return them to the cellar, or some convenient place (not too dry) for their reception. Previous to filling these casks with cider the ensuing season, we scald and rinse them again, as above. Foul musty casks ought to be committed to the fire. Hogs-heads or large casks are the best for cider, especially those that have recently been used for rum or other spirit.

Apples that drop early we make into cider for stilling, it being unfit for table use; the spirit of which, together with that of the lees, we return back to our store cider at the time of racking, which is generally about the first of January. Cider made of apples before they are fully ripe, we deem unfit for drinking; and even when ripe, if they are made into cider during warm weather so as to produce a sudden and rapid fermentation, the cider will unavoidably be hard and unpleasant. The fact is, the slower cider is in fermenting, the better it will be at any age; consequently the later in the season it is made, and the cooler the weather (if the business can be conveniently performed) the better; especially for long keeping. However, this is a cold work for the fingers, unless pressed in a rack, which is the best method.

About the first of November we think a suitable season, if the weather be dry, to gather and put under cover apples for store cider.—

After lying in this situation till mellow, (not rotten) we commence grinding.

Doubtless good cider for early use, or perhaps for the first year's drinking, may be made previous to this time; but cool serene weather should be chosen for the business.

The grinding trough should be spacious enough to contain a cheese, in order to admit the pomace (if the weather be cool) to lie over one night before pressing. This method contributes much, both to the colour and quantity of the cider.

In the morning press it out gradually, and put it up into the casks through straw, or rather a coarse sieve, fitted and placed within the funnel: after which, we convey it immediately to a cool cellar, leaving out the bugs till the fermentation chiefly subsides, which may be ascertained by the froth settling back at the bung-hole. We then drive in the bungs tight, leaving a small spigot vent a while longer, if need require, to check the pressure, which must finally be made air tight.

About the first of January, we rack it off free from the lees into clean casks. Those that have been recently used for spirit are to be preferred. But otherwise: having drawn off one cask, we turn out the lees, scald and rinse the cask as above; add three or four pails full of cider; then burn in the cask, a match of brimstone attached by a hook, to the end of a large wire fixed in the small end of a long tapering bung fitting any hole. When the match is burnt out, take off the reamant; apply the bung again, and shew the cask in order to impregnate the cider with the rumour. Add more cider and burn another match. Then add from one to three gallons of spirit (obtained from the lees as above) to one hogshead; fill up the cask with cider, and bung it down air tight, and let it remain till it becomes of mature age.

Cider managed in this way will keep pleasant for years. We would not be understood to suggest a notion, that good cider cannot be obtained without the addition of spirit; especially for immediate use, or the first year's drinking; but the contrary. Yet spirit will give it a new and vigorous body, and insure its preservation.

To make matches for stumming casks, take strips of linen or cotton rags about 1 1-2 inch wide, and 3 or 4 inches long, dip the end of each in melted brimstone, to the extent of one inch.

2d. Another improvement, though very simple, we shall recommend, as having been highly beneficial to us for some years; that is, the preservation of vines, and other plants, from the depredations of bugs and insects, by means of wooden boxes. These boxes are made of thin boards, about one foot square, and 4 or 5 inches deep; covered with thin, loose-woven cloth, either of cotton, hemp, or linen, quite as thin as a coarse meal sieve. The cloth should be oiled over with linseed oil. The boxes are placed and kept over the hills till the vines become of sufficient growth and strength to bid defiance to the depredations of those devouring insects. This is the cheapest, best, and finally the only effectual method that we have ever found to preserve our vines from destruction.

These boxes with careful usage will probably last for the term of 15 or 20 years. They should be put under cover when they are not in use; and it would be well to repeat the oiling of the cloth tops once in 4 or 5 years with train oil.

3d. Another thing having been under our experience for many years, we find to be very beneficial to us in our joint situation; that is, it saves considerable manual strength and hard labour, viz. the taking off hay from the load and placing it on the mow by a horse, with what we call grabs or hooks, fixed to a tackle, which is suspended to the ridge pole or rafter of the barn, nearly over the centre of the mow; and to the rope of which (passing under a truck) a horse is hitched and ridden by a small boy directly forward through the yard. We frequently take off a ton of hay at four or five draughts, each of which being suspended by a rope, is, by two hands easily swung, as the rope slacks, to any part of the mow. The rope is held by the loadman, while the horse turns about and commences his trip towards the load. However, we could not recommend this method to farmers who cut hay on a small scale, or where but few hands are employed.

At any rate, we should rather prefer the location of a barn (when practicable) on the side of an hill, so as to facilitate a passage over a floor across the beams. This method we have proved, and find it an excellent plan. I presume one man in this situation, will get off more hay in the same time, and with less fatigue, than four would in the ordinary way.

4th. And lastly; we have a machine (moved by water) for thrashing and cleaning grain; which we can, with confidence, recommend to great farmers. This machine will thrash and winnow unusually clean, at least 100 bushels per day: it has done 16 bushels per hour. Thus it not only saves much time and hard labour, but also enables us to secure our grain from vermin and other waste, immediately after harvesting. Although (as we understand) some sagacious speculator has copied a model, or nearly a model, from our machine, and obtained a patent for the same, as having been his own invention; yet we think we are fully able to prove our right of claim to the invention, it being the result of our own mental researches.

We never saw nor heard of any thing similar, previous to our building the above mentioned machine for our own use, in the summer of the year 1819; to the benefit of which, we make you and every other man freely welcome, having never intended to make other people tributary to our avarice, by securing a patent for this, or any thing else, that might be of service to mankind. However, as we have not room here to give a plan, nor even a minute description of this machine, you will please to call and see it the first opportunity, and judge for yourself of its utility.

Although water may justly be considered by far the best power of motion, yet I presume this machine may be so constructed as to operate by horses. The cost, exclusive of a building to contain the grain, is probably about \$100.

I am, with due respect, your friend,

FRANCIS WANKLEY.

P. S. One of your former numbers speaks much in favor of fiorin grass; if you think it to be profitable, we should like to procure means for propagating it; also a small paper of Mangel Wurtzel seed.

FOR THE NEW ENGLAND FARMER.

MR. EDITOR.—It has become a general practice among farmers to keep Swine shut up in small yards for convenience, and the making of manure. This method I have adopted, and find the advantages to be very great. I still find it necessary that hogs, thus confined, should be constantly fed during the summer season with green food, as their nature is such that they require it, and I am decidedly of the opinion that they do much better for being thus fed. I have sometimes cut clover and other kinds of grass, and thrown it to my hogs, which they eat very well, but I have more generally practised feeding them with swamp brakes, which they devour greedily, and which I believe do them as much good as clover or any other kind of grass.

I go to a swamp once in three or four days, and gather a quantity of brakes, and deposit them in my cellar in order to keep them in a green state. Once in a day I give as many of them to my hogs as I think they will devour.

My method of gathering them is to pull them up, being careful to get the heart or pith which grows in the centre at the bottom. This kind of brakes frequently grows in meadows and sometimes on hard land among grass, and if pulled in June (taking care to get the heart or pith) they rarely if ever grow again.

A FARMER.

Worcester, June 23, 1823.

FOR THE NEW ENGLAND FARMER.

MR. EDITOR.—Having taken an excursion of a few days into some of the towns in Maine, I have been induced to examine a number of cornfields; in many of which I have found a great number of our secreted destructive enemies, the *wire* or *chit worm*. This I presume is their returning abundant year. I found most farmers insensible of the approach of the lurking foe. One farmer in Durham, with great labor and care, opened every hill in a field of two acres, and found on an average a dozen in a hill. He replanted it on Saturday last with seed soaked in an infusion of the spirits of turpentine. I examined a number of hills with him yesterday, the 4th of June, and found on an average seven to a hill; the last planted kernels as yet unvounded. I took an hundred of these hardsided destroyers of our prospects of hasty pudding, and gave them a snug birth in a snuff box (being entirely destitute of the comforting powders,) and distributed them as follows:—I took out fifty, and gave the remainder a sprinkling of earth for bedding in the box. Now as I am neither doctor, chemist nor farmer, I take courage to trouble you with my *guessing* experiments, solely to awaken the attention of the philosopher and thinking farmer to a subject of deep interest to this country. I took three spoonfulls of the decoction of the sweet or white elder, that had been boiled one hour; put it into a common white saucer, and then put in a small piece of earth in the centre. I then put in a number of the worms; they still live, but have lost the power of locomotion;—they have now been in twenty-four hours. I then put six or seven into another saucer with three spoonfulls of the juice of elder only; they died in eighteen hours. I put in the same number with two spoonfulls of lime, so wetted that water stood round the edges of the cup; they

died in about six hours. With three spoonfulls of juice I put one of lime; they died in about twelve hours. With three spoonfulls of water, and one of salt, they lived about eight hours. In the solution of copperas, a piece as large as a robin's egg, and four spoonfulls of water, they were lively at twelve last night; I found them dead this morning, June 6th, at 5 o'clock; they of course died between twelve and seventeen hours. The fifty remaining in the box appeared to be in excellent health. I put thirty kernels of corn into each saucer, which I intend to plant this morning, and to put a goodly number of worms into each hill, hoping to learn whether corn will grow after such trials, and whether the worm will touch it; whether that will operate as the greatest security against his depredation, which in the shortest time will destroy him. This I know not; but these experiments were founded on the consideration, that wild animals, birds and insects, almost universally avoid everything poisonous in the natural and simple state. It is generally by compounds that instinct is deceived, but by the juices of some simples many creatures are instantly allured to destruction. For example, take a few kernels of the *ergot* or *spurred rye*, steep them a short time in water, pour it into a plate and set it on the floor in a season; all the flies in the room in a few minutes will be found dead at the seducing cup. This is probably the most powerful poison found in Maine. I have it from unquestionable authority that a girl in Topsham, out of banter, undertook to eat it, but before she had finished two kernels was most severely emeticised. The theory is very plausible, that this was the origin of the dreadful and sometimes almost uncontrollable spotted fever, that took its rise in Worcester county, Mass, a rye country, and which extended through New Hampshire and Maine. Where the fever raged most, the spurred rye was most abundant. For myself I always have it picked out of rye before I send it to mill. I had rather give it to flies than eat it myself.

Much, I am told, has recently been written on the wonderful powers of the sweet elder, bomen of the first science in Europe. One says: "Only whip your tender plants, infested with insects, with the bough of elder, they instantly disappear; sprinkle them with its juice, they will not return; lay a leaf at the hole of a mouse, he will never come out." If so powerful on the surface, may it not have some effect beneath it? I have induced many farmers to replant their corn soaked at least twenty-four hours in the elder, after the water is boiled half away. Should this succeed, it will be important to the country; should it fail, it will not hurt the corn.

It should be asked why I intrude unproved theorems on the public? I answer, it is more to warn the farmer of his unseen danger, than in any way to direct or advise a remedy. The spring has been late, and in my opinion there is a great prospect of another cold season. Let the farmer recollect 1806, 1812, and 1816, what insects then appeared, what crops he raised, and should he be necessitated to replant, oats and potatoes may yet yield a good crop.

I have this moment received communications from two farmers in Durham, with much satisfaction. One has planted four quarts of corn on *ubble* ground, not soaked; one quart soaked in water forty-eight hours, with half a gill of

spirits of turpentine. The other did the same on a new ploughed ground. The un-oaked of both almost entirely cut off. The soaked of both as come up untouched and vigorous.

I have been ignorant of the quantity of turpentine that may be used with safety. Here seems to be a good demonstration.

The brown bug, or smaller beetle, appeared on the 15th of May, and the air is literally filled with them in the evening. They sometimes give you an uncivil knock in the face in the evening, as if they had lost their way.—They are now depositing their eggs to rear the mischievous grub worms, that eats corn, cabbage and most vegetables at the surface. The young, it is said, arrive at maturity in four years, then return to the bug again. *Quere*—Is not this the returning year of this plodding creature, that seems wantonly to cut off your plant, without making use of it? A.

FOR THE NEW ENGLAND FARMER.

M. Farm, June 21, 1823.

MR. EDITOR—I saw a request in your paper, page 347, that some person would give a plan for a Cow House, and as I have seen no answer will give you a plan of mine; not that I think it perfect, but that every subscriber is in duty bound to see that all inquiries made through our paper are answered in due time. It is 30 feet long—stanchions are from the centre of each 3 feet apart—crib 3 feet wide—a rack on one side of the crib next the mow one foot wide, which is one foot from the floor, that the meags may be easily put under—the slats in the rack perpendicular—a board in the bottom of the rack slanting, that the seeds, &c. may fall next the cattle—width from stanchions to side of the barn 10 feet—bed must be varied in width as the cattle are long or short—trench nine inches lower than the bed, and nine inches lower than the walk back of the cattle; or half the depth will answer there, and is preferable, particularly if the barn is low posted. Stanchions I think far preferable to bows for security, but cattle lie easiest in bows. My cows leads are all parted with a partition four or five feet high, which prevents all quarrels and eaching. Yours, &c. HERDSMAN.

From the Mass. Agricultural Repository.

ON A MODE OF DESTROYING INSECTS.

I take the liberty of indicating a method of destroying the rose-bug, and other winged insects, which are such nuisances in our gardens, and so destructive to the tender shrubs and plants, which was suggested to me by the following occurrence. Going into my garden one summer evening, with a lanthorn, to gather salad, I found, on my return to the house, that the lanthorn was covered with rose-bugs and other insects, which had been attracted to it by the light. This simple circumstance led me to the inference that the propensity of moths and all winged insects to fly at a light, will furnish us with the means of at least diminishing their number by suffering them to become SELF-DESTROYERS.

It is well known how troublesome they are by thronging our rooms in the evenings, where a candle or lamp is burning; how they fly round it, and scathe their wings in its blaze; and how they pelt against the windows, which were obliged to shut in order to exclude them. Now,

I conceive, that availing ourselves of this lure, we might kindle small fires in different parts of our gardens, near the vines particularly which are annoyed by these voracious depredators, and they would precipitate themselves into the blaze. A kind of flambeau might be made, by winding round one end of a stick about a foot and a half long, old rags, or swigled tow, dipped in tar or melted brimstone. Let this be stuck into the ground, and set on fire with a candle; and it will continue burning a considerable time, and prove the funeral pyre to myriads. These lights might be so placed as not to injure the adjacent plants, nor endanger surrounding buildings, as no sparks would fly from them; and, if any fears are entertained, they might be watched till they were burnt out, and the effect would be thus ascertained, in order to justify the repetition of the experiment.

I have often found the difficulty of freeing my plants from the ravages of insects, especially of the coleopterous class, because they have a kind of coat of mail covering their wings that sheds off whatever is sprinkled over them with the purpose of destroying them, and because they occupy generally the under sides of the leaves, or frequent high branches where they are inaccessible: but they would be tempted to fly down to a blaze. The various kinds of moths, (parents of most destructive broods,) and the winged aphides, those great destroyers of the grape vine, would more certainly be lured by a bright flame to inevitable destruction.

Perhaps a flambeau, at the end of a long pole, might be held up near to apple trees when in bloom, and be the means of destroying many of the small flies which deposit those eggs in the opening blossom that form the worm generated in the core of the fruit.

In the early summer I have observed immense swarms of minute black flies, just at evening, around the plum trees; and suspect them of being the occasion of those galls, or excrescences which occasion such injury to the tree. If so, the expedient which I have suggested, may be tried to advantage upon them.

These remarks, are, perhaps, too trivial to be communicated to the public in the Agricultural Repository and Journal. If, however, you think that they may serve to suggest expedients to those who have leisure and opportunity to make the trial, you will please make that use of them. With affectionate regards, your friend,

THADDEUS MASON HARRIS.

The following recipe is very important indeed if its efficacy has not been over-rated. It sometimes happens that a remedy is applied to a disorder which is already yielding to the operations of nature, and the medicine has the credit of effecting a cure which would have taken place if it had not been applied. And it may happen that an application may be made to a tree, vine, or other vegetable, for the destruction of insects, at the precise point of time when they would have died or have ceased their ravages without such application; and in that case, the thing applied is thought more useful than it is. We hope that nothing of that kind has taken place in the experiments related in the following article; and that a little sulphur introduced

into the body of a fruit tree will preserve it from caterpillars, canker worms, &c. but we shall entertain some doubts on the subject, for the reasons above mentioned, till farther experiments shall prove or disprove the efficacy of the supposed specific.—*Ed. Farmer.*

From the second volume of the Memoirs of the Board of Agriculture of the State of New York.

On preventing the destruction of Trees by Caterpillars.

[By George Webster, of Albany.]

From my experience, I am fully satisfied our fruit and forest trees may be preserved from that dreadful insect, the caterpillar, in a very sure and easy way. In the year 1805, the large elm at our corner was nearly stripped of its leaves by a small caterpillar. Various modes to destroy them were made use of, such as covering the body of the tree with tar, fish oil, and burning their nests, but without any good effect.—Some day in the month of July, I was standing at our door, when a gentleman from Niskayuna was passing by. He accosted me in words like these:—"George, 'tis a pity to lose so fine a tree." In answer—"We have made use of various articles to destroy them, but without success."—"Send," says he, "and get a little sulphur, and bore into the tree about six inches, and fill it with sulphur, and my word for it, not a caterpillar shall be seen after forty-eight hours." "Will you stay and see it done?"—"I will," said he. The hole was bored, the sulphur put in, and a piece of wood the size of a cork drove in very strongly, to prevent the sap or sulphur oozing out. In a less time than he mentioned, there was not the vestige of a caterpillar on the tree. Soon after, a large caterpillar appeared on our poplars, in front of my house: every tree was served in the same way as the elm had been, and the result the same—while my neighbors cut down those fine trees, because they were very much alarmed that the insect was that very venomous reptile called "the asp." A few days after I discovered that a very beautiful plum-tree in my yard was attacked by the caterpillar: the same course was applied, and the result the same. I have followed this practice every year since 1805, when I discovered these insects on my trees, and there has never been a caterpillar on my trees after forty-eight hours. It has been tried in New York and Pennsylvania, where I have been present, and in the western parts of this state. In no case has it, to my knowledge or belief, failed. Two men are sufficient to go through an orchard or forest of 200 trees in a day.

Not.—It is possible that the mode in which the sulphur is put in the tree, might be easier communicated by words than on paper.

P.S. I have strong presentiments in my mind, that if applied to our peach, plum or cherry trees, it would prevent the black rust.

Rust of Wheat.—Mr. Isaac Young, of Georgia, mixed rye amongst his seed wheat, and thus escaped the blast of his wheat. It was repeatedly tried, till he was convinced of its efficacy; and then he sowed five acres with wheat, surrounded with a belt of 25 feet breadth of rye; this also succeeded; and being repeated, is found a certain security to the wheat.—*Bordley's Husbandry*

From the Mass. Agricultural Repository for June.

Reflections on the importance of steeping Seeds in various fructifying liquids, which has been the subject of much discussion.

Men have been always prone to devise, and adopt some ready and mysterious way of hastening perfection in all the arts. There is no one of them, that has not at times boasted its philosopher's stone—some expeditious mode of dispensing with what Providence has made indispensable to the attainment of all good in this world, viz. constant, unremitted, intelligent exertion. However futile and ridiculous these endeavors may have been in other arts and sciences, (and they are in this age of true philosophy regarded, as they ought always to have been, as the chimeras of enthusiasts,) in the art or science of agriculture, they are eminently preposterous and absurd. There is in this art, no easy and compendious road to success. The faithful division of the soil by repeated and incessant labor, the application of proper manures or composts to enrich it: to impart to each particular species of soil, the elements in which it is found to be deficient—these are the great secrets, and the only secrets, of successful cultivation. While we were young proficient in this science, we read with wonder, not unmixed with incredulity, the surprising effects of steeping seeds in various liquors, impregnated with substances, which a vain philosophy, always more satisfied with novelty, than with truth, had decided to be the best food for plants. As we have grown older, we have found that the most rational physiologists are not yet agreed as to what is the proper food of plants. They have contented themselves with simple facts, that some plants prefer one species of soil or manure, and others prefer a very different one. And they have endeavored, as far as possible, to give to each plant the kind of soil and manure in which, and by which, it is found to flourish best.

The supposition, that so small a seed as that of wheat or Indian corn can imbibe from being steeped for twenty-four hours in any liquor, however fructifying or favorable, a degree of force, which can enable it to withstand the effects of an uncongenial soil, or to produce more abundantly even in a congenial one, savors too strongly of mystery to be readily adopted by any rational mind. We are not disposed to deny any influence whatever to such experiments: but we think it must be very limited, and that it has been grossly over-estimated. It would be indeed strange, if there were not some quackery in this art, as in all others, and while we have at least one hundred medicines, which will cure every disease to which man is subject (though no visible diminution of disease has been as yet produced by any or all of them,) agriculture should not also have its universal panacea, competent to eradicate all disease, and to produce the highest possible state of vegetable health. It is with no small pleasure that we are able to state, that Evelyn, the Baron of philosophical agriculture, had a thorough disbelief in this short hand mode of producing luxuriant and prolific vegetation. In speaking of the soils in which forest trees flourish, he gives this sly rebuke to the believers in fructifying steepers. "Rather, therefore, we would take notice how many great wits and ingenious per-

sons, who have leisure and faculty, are in pain for the improvement of their heaths and barren hills, cold and starving places, which causes them to be despaired of and neglected, whilst they flatter their hopes and vain expectations with fructifying liquors, chymical menstrua, and such vast conceptions—at the same time, that one may show them as heathy and hopeless grounds and barren hills as any in England, that do now bear, or lately have borne, woods, groves and copses which yield the owner more wealth than the richest and most opulent wheat lands."

There is a strong vein of sarcasm and truth in these remarks, and they had their effect in covering England with valuable and beautiful forests and groves, as we now find it. It may be of some practical use to add the experience of the writer of this article. He planted some hills which consisted entirely of sand or gravel, and which would not furnish vegetables for the support of a single cow for six weeks in a year. It was represented to him by his neighbors that trees would not grow upon them. It seemed, indeed, to be a hopeless undertaking. Still he persevered, and the wood now growing at the end of fifteen years would pay, if cut down and sold to the bakers, for a sum equal to the price of the land; he believes, to double that price. But the most important remarks on this subject were made in a note by the editor of Evelyn's Sylva, Alexander Hunter, the author of the "Georgical Essays," a man of rare merit, philanthropy, and good sense. He goes at large into the question of the value and importance of steeping seeds, placing the question, as we believe, on its true and rational ground.

"The steeping of seeds," he remarks, "in prolific liquors, is not of modern invention.—The Romans, who were good husbandmen, have left us several receipts for steeping grain, in order to increase the powers of vegetables. In England, France, Italy, and in all countries where agriculture is attended to, we see a variety of liquors recommended for the same purpose. Good nourishment has ever been observed to add strength and vigor to all vegetables. Hence it was natural to suppose, that by filling the vessels of the grain with nourishing liquors, the germ with its roots would be invigorated. *How far this is founded on just principles remains now to be examined.* For my part," says Mr. Hunter, "I am not an advocate for steepers. All my experiments demonstrate that they have no inherent virtue. I have more than once sown the same seed, steeped, and unsteeped, and though all other circumstances were minutely alike, yet I could never observe the least difference in the growth of the crops. I confess that when the light seeds are skimmed off, as in the operation of brining, (or steeping in water saturated with salt, which is heavier than common water) the crop will be improved, and diseases prevented, but these advantages proceed from the goodness of the grain sown, and not from any prolific virtue of the steep. I am happy in not being singular in my objection to steepers. Many philosophical farmers have been induced to quit their prejudices, and are now convinced, from their own trials, that there is no dependence on prolific liquors, though ever so well recommended. Some people have been hardy enough to persuade themselves, that the tillering of wheat, (its disposition to spread and send up many shoots from a single kernel) may be so

much increased by invigorating the grain (by steepers) that only one half of the seed will be required. Duhamel, one of the most accurate of experimental husbandmen, and a most excellent philosopher, speaks in the strongest terms against the practice of steeping, so far as it supposes an impregnation of vegetable particles. I shall not here repeat his experiments. I shall only observe, that they are such as any farmer may make; they are plain and conclusive. Good seed, when sown upon land in good tilth, will always produce a plentiful crop. The best grain impregnated to the full with the most approved steep, and sown upon land indifferently prepared, will forever disappoint the hopes of the farmer. I do not presume to condemn the practice in positive terms because my own experiments are against it. Other experiments may be opposed to mine. I shall therefore rest the whole upon a description of what happens to grain, after it has been committed to the earth. The subject is curious, and the discussion of it not very difficult. A grain of wheat contains within two capsules, a considerable share of flour, which, when melted down by the water, juices of the earth, constitutes the nourishment of the tender plant, until its roots are grown sufficiently large to absorb their own food. Here is evidently a store-house of nutriment, and of course the plumpest grains are the most eligible for seed. From repeated experiments, I am convinced that the plumpest seeds are always preferable to the small ones. I have sprouted every kind of grain in a variety of steepers, and can assure the farmer that the root and germ never appeared so vigorous as when sprouted in simple elementary water—an argument that the seed requires no assistance. The same steep, when applied in quantity to the soil, will undoubtedly invigorate the roots, and nourish the plant; but in that case it operates like other manures, and loses the idea of a steep. A nitre, and sea-salt, and lime, are generally added to steepers, I have constantly observed that their application rendered the radicle and germ sickly and yellow—a plain proof that they were unnaturally used at that season. Did the farina of the seed need any additional particles, it might be supposed that broth made of the flesh of animals would be most agreeable. [Probably founded on the fact that animal manure is the most powerful.—*Editors Repository.*]

"To be satisfied of that, I sprouted some grains in beef broth, and an equal number in simple water. They were afterwards sown, but I could perceive no difference in the crop. As no invigorating, or fructifying liquor had ever stood the test of fair experiment, we may venture to lay it down as an established truth, that plump seed, clear of weeds, and land well prepared to receive it, will seldom disappoint the hopes of the farmer."

We are not prepared to express a decided opinion in favor of Mr. Hunter's suggestions, though they derive great weight from the support of two such men as Duhamel and Evelyn.

There is one consideration which Mr. Hunter has certainly not pressed so far as he might have done. The bulk of the seed is so extremely small, compared with the roots and top of an plant (Indian corn, for example, whose root and tops probably contain from 200 to 500 times as much matter as the seed,) that it is incredible that any productive virtue (be it ever so

great) could materially affect the growth of a plant, which daily requires so much food. We thought the article ingenious, and we give it the preference, because it is in opposition to a long established opinion, founded in mystery.

NEW ENGLAND FARMER.

SATURDAY, JUNE 29, 1833.

NOTICE.

Gentlemen whose names are now on the list of subscribers to this paper are respectfully solicited to continue their patronage; and those who do not give us notice to the contrary, on or before the 15th day of July next, will be considered as subscribers for the second volume.

Farmer's and Gardener's Remembrancer.

MAKE GOOD BUTTER.—You may as well make good butter as bad. If your butter be of a good quality and well preserved, it will not only fetch more in market, but be more wholesome as well as palatable to consume in your own family.—We gave some remarks relative to making butter in our paper No. 2, p. 12, as well as in some other papers of a later date, but as we have learned from good authority that some of our subscribers are so careless and inattentive to their own interests that they do not preserve the files of our papers, and as particular directions of a complicated process might escape the memory even of an attentive reader, we shall repeat a part of our prescriptions, and incorporate them with others, which we believe will be found useful.

The dairy house should be kept neat, should not front the south, south-east or south-west.—An apartment in a sweet and well ventilated cellar will answer a good purpose to keep milk and cream in. Cheeses should not be set to dry in the same room where your milk is set, for they communicate an acid matter to the surrounding air, which will have a tendency to make the milk sour. The milk room and cheese room should therefore be separate apartments. It will be well to place your milk room, if possible, over a spring or brook, near the dwelling house; and you may have a stone floor, and channels in the floor to pass the water round near the inside of the walls. Into these channels the pans may be set, filled with milk, and surrounded by water. If water could be introduced into the milk room, so as to fall from some height on the pavement, it would likewise prove advantageous, as the waterfall and the evaporation it causes will contribute to preserve the air continually pure, fresh and cool. As the milk itself when brought in warm, will naturally tend to raise the temperature of the milk room too high, it is recommended to have an ice-house attached to the dairy, especially where the advantage of a current of water cannot be obtained. An ice-house would prove still more profitable if the dairy be situated near large towns, where the ice could be sold in summer. Ice may be perhaps as well kept in a common cellar, according to Mr. Nichols' mode given page 114 of our paper, as by any method

more troublesome and expensive. According to Dr. Deane, the temperature of the milk room should be from 50 to 55 degrees of Fahrenheit's thermometer; and the Complete Grazier says "where the temperature of the milk room has become affected by the carrying of newly drawn milk into it, it may be easily reduced to the proper temperature by suspending a small quantity of ice at a considerable height from the floor; and if, during winter, the cold should become too great, a barrel of hot water closely stopped, or a few hot bricks placed on the floor or table of the milk room will readily counteract its effects. But on no account whatever should a chafing dish with burning coals be used, as it will certainly impart a bad taste to the milk."

The proper receptacles for milk are earthen pans not glazed nor lined with lead, or wooden trays. Lead, copper or brass noisils, as well as earthen ware vessels glazed with lead, ought on no pretext whatever to be used; for the acid which is contained in milk, combines with these metals, and forms a poisonous compound with them. Sir John Sinclair recommends vessels made of cast iron, softened by annealing them in charcoal, so that they will not break by an ordinary fall, turned smooth in the inside, and laid over with a coat of tin to prevent the iron from coming in contact with the milk. These milk dishes are stated to be kept more easily clean than wooden vessels; and their superior power of conducting heat, cools the milk so rapidly that the Scottish farmers' wives, who have given them a fair trial, affirm that they throw up *one third more cream* from an equal quantity of milk.* Cast iron vessels, without being tinned, would give no poisonous quality to the milk, but they might render the produce of the dairy unpalatable.

"All dairy utensils ought to be most carefully scoured, first with hot water, and afterwards rinsed with cold, and kept in an airy place, in order that every possible degree of acidity may be removed. Should one or two scourgings be insufficient, they must be repeatedly cleansed until they become entirely sweet, as the slightest taint or acidity may cause material loss."† Slate, according to some accounts, makes very good milk coolers, and perhaps free stone might answer as well.

The quality and quantity of cows milk greatly depends on the nature of their food. Potatoes, carrots and parsnips are recommended as causing cows to give excellent milk; and mangel wurtzel is highly spoken of for the same purpose. Cabbages, if sound, answer an excellent purpose, but the decayed leaves give a bad taste to the milk. It is thought best to milk cows three times a day if fully fed, and great caution should be exercised by the persons employed, to draw the milk from them completely, not only to increase the quantity of produce, but to preserve its quality. Any portion which may be left in the udder, seems gradually to be absorbed into the system, and no more is formed than enough to supply the loss of what is taken away; and by the continuance of the same mode, a yet farther diminution takes place, until at length scarcely any is produced. This last mode of milking is practised, when it is intended to render a cow dry.

* Agricultural Report of Scotland.

† Complete Grazier.

You should be cautious in your choice of persons to milk your cows; because if a cow be roughly handled, it not only causes pain to the animal, but induces her not to give down, or part with her milk, and such retention injures the cow sometimes very seriously, and always causes her to get into the habit of giving less and less milk at each successive milking, till rendered completely dry. When cows are *ticklish*, as the phrase is, they should be treated with gentleness; and if the udder be hard and painful, it ought to be fomented tenderly with warm water.

"After the milk is drawn from the cow, it should be carefully strained through a linen cloth or hair sieve, (Dr. Anderson prefers a sieve made of silver wires, on account of its superior wholesomeness) into the cream dishes, which should never exceed three inches in depth, though they may be made so wide as to contain any quantity required, and which ought to be perfectly clean, sweet and cool. If any ill flavor is apprehended from the cows having eaten turnips, &c. the addition of one eighth part of boiling water to the milk before it is poured into the dishes will effectually remove it.* When filled, the dishes ought to be set upon shelves or dressers, there to continue till the cream is removed. This should be steadily done by means of a skimming dish, if possible, without spilling any upon the floor, because it will speedily taint the air of the room, and the cream poured into a vessel, till enough be obtained for churning."

The Farmers' Assistant judiciously observes, "If new milk be kept as warm as when it comes from the cow, no cream will rise on it; but when sufficiently cooled, the cream separates from the rest and rises to the top. In order then to effect this to the best advantage, the new milk should be made as cool as possible, and the cooler it is thus made the more suddenly and effectually the cream will rise. To set milk pans made of tin in beds of salt would no doubt be useful, where the cellar is too warm; and to set all milk vessels on a floor, which is constantly covered with cold spring water is also an excellent plan."

The following remarks relative to the best mode of making butter, are chiefly derived from Dr. Anderson's valuable Essay on that subject. 1. The milk first drawn from a cow is always thinner, and inferior in quality to that afterwards obtained; and this richness increases gradually to the very last drop that can be drawn from the udder. 2. The portion of cream rising first to the surface is richer in quality and greater in quantity, than that which rises in the second equal space of time, and so of the rest, the cream decreasing and growing worse as long as it rises at all. 3. Thick milk produces a smaller proportion of cream than that which is

* Mr. Young has recommended the dairy-man to boil two ounces of nitre in one quart of water, and to bottle the mixture; of which when cold, a large tea cup full is to be added to ten or twelve quarts of milk as soon as it comes from the cow; the quantity of salt petre is to be increased as the turnips become stronger. The feeding of cows with the roots alone will, as the Earl of Uxbridge found, prevent the milk from having a bad taste. Another method of removing any ill flavor, arising from the cows having eaten turnips, consists in warming the cream, and afterwards pouring it into a vessel of cold water; from which the cream is to be skimmed as it rises to the surface, and thus the unpleasant taste will be left behind in the water.

thinner, though the cream of the former is of a richer quality. If thick milk therefore be diluted with water, it will afford more cream than it would have yielded in its pure state, though its quality will at the same time be inferior.

4. Milk carried about in pails, or other vessels, agitated and partly cooled before it is put into the milk-pans, never throws up such good and plentiful cream as if it had been put into proper vessels immediately after it came from the cow.

From these fundamental facts, the Doctor deduces, in substance, the following rules:

1. The cows should be milked as near the dairy as possible, to prevent the necessity of carrying and cooling the milk before it be put into the dishes; and as cows are much hurt by far driving, it must be a great advantage, in a dairy farm, to have the principal grass fields as near the dairy or homestead as possible. In this point of view, also, the practice of feeding cows in the house rather than turning them out to pasture in the field, must be obviously beneficial.*

2. The practice of putting the milk of all the cows of a large dairy into one vessel, as it is milked, there to remain till the whole milking be finished, before any part is put into the milk-pans, seems to be highly injudicious, not only on account of the loss sustained by the agitation and cooling; but also the more especially, because it prevents the owner of the dairy from distinguishing the good from the bad cow's milk, so as to enlighten his judgment respecting the profit that he may derive from each. Without this precaution, he may have the whole of his dairy produce greatly debased by the milk of one bad cow for years together, without being able to discover it. A better practice, therefore, would be to have the milk drawn from each cow, separately, put into the creaming pans as soon as milked, without being ever mixed with any other; and if these pans were all made of such a size as to be able to contain the whole of one cow's milk, each in a separate pan, the careful *daïr* would thus be able to remark, without any trouble, the quantity of milk afforded by each cow every day, as well as the peculiar qualities of the cow's milk. And if the same cow's milk were always to be placed on the same part of the shelf, having the cow's name written beneath, there never could be the smallest difficulty in ascertaining which of the cows it would be for the owner's interest to dispose of, and which he ought to keep and breed from.

3. If it be intended to make butter of a *very fine quality*, it will be advisable, not only to reject entirely the milk of all those cows, which

* Mr. Lawrence, in his "Treatise on Cattle," observes that "it is affirmed by theoretical writers, that to feed cows in the home stall increases their quantity of milk, a fact which various experiments compel me to disprove. With me it has ever had the effect of adding to the substance of the animal, and of diminishing the quantity of her milk; probably from defect of the exercise she was wont to take in collecting her food, and the selection of herbage she was enabled to make." This writer, however, is of opinion, that "the aggregate quantity of milk in a dairy may be enlarged by keeping pastures free from the tread of the cows, since a greater number may be kept, perhaps by one third, on the same extent of ground; at the same time the animals may be secured from the harassing and debilitating effects of the sun and flies."

† A provincial word, denoting the person who has the chief concern in a dairy.

yield cream of a bad quality, but also, in every case, to keep the milk that is first drawn from the cow at each milking, entirely separate from that which is got last; as it is obvious, if this be not done the quality of the butter must be greatly debased, without adding much to its quantity. It is also obvious, that the quality of the butter will be improved in proportion to the smallness of the quantity of the last drawn milk which is used, as it increases in richness to the very last drop that can be drawn from the udder at that time; so that those who wish to be singularly nice, will do well to keep for their best butter a very small proportion of the last drawn milk.

Dr. Anderson proceeds to state in substance that in the Highlands of Scotland the common practice is to let the calf suck till the dairy-maid judges that it has had enough; it is then separated, the legs of the mother having been previously shackled by a very simple contrivance, to oblige her to stand still, and the dairy-maid milks off what is left by the calf. In this way, he observes, the Highland butter has been greatly celebrated as the "richest marrowy butter which can any where be met with."—The milk which is first drawn, and consequently of inferior quality, may be converted into an inferior kind of butter, sold sweet, or made into cheeses, which, by being made of sweet milk, if made with care and skill, may be of fine quality.

Churning ought to be regularly continued till the butter comes, or is formed. If the motion in summer be too quick, the butter will, in consequence, ferment, and become ill tasted; and, in winter, it will go back. Churning, it is said, may be made easier by putting the bottom of the pump churn about one foot deep into a vessel of cold water, and continuing it there till the butter is made. The addition of one or two table spoons full of distilled vinegar, after churning a while, will, it is said, produce butter much sooner in many instances than it can be formed without such addition.

Some writers advise to wash the butter after it is formed, thoroughly in several waters till all the milk is removed. Dr. Anderson, however, advises to force the milk out of the cavities of the butter by means of a flat, wooden ladle, furnished with a short handle, at the same time agitating the butter as little as possible, lest it become tough and gluey. "The beating up of butter," he observes, "by the hand is an indelicate practice, particularly if it be constitutionally warm; and as it is hurtful to the quality of the butter to pour cold water on it during this operation, the butter, if too soft to receive the impression of the mould, may be put into small vessels, and there be permitted to float in a trough of cold water beneath the table, without wetting the butter, which will soon become sufficiently firm. Or, when butter is first made, after as much of the milk has been got out as possible, it may be thinly spread on a marble slab, and the remaining moisture be absorbed by patting it with clean dry towels."

It is said in Bordley's Husbandry, that "dashing in water, and then without pause, clearing the butter from every particle of water is widely different from washing butter by kneading and letting it remain at all in the water. Very good butter for flavor, color and consistence, is made by one who washes it twice, but never lets it remain in the water a moment. Another

butter maker says, mix the salt in the butter in the evening, and let it rest till morning, then work out the liquor, but never let it be once touched with water.

Other authors, however, including the writer whose remarks on this subject are republished from the Poultney Gazette in our paper p. 364, say that the butter should be well and repeatedly washed; and the Complete Farmer, an English work of merit, advises, after the churning is completed, to pour water into the churn, and continue to work the churn some time; then to turn out the water and pour in fresh, and repeat the process three times. Then to suffer the butter to remain in the last water some hours to cool and increase its hardness, when the warmth of the weather renders it requisite. Dickson's Agriculture likewise recommends kneading, breaking and pressing new made butter in water, and changing the water till at last it appears scarcely tinged with the milk, which is the only proper criterion by which to determine when the butter has been sufficiently worked.

Dr. Anderson remarks, that a considerable degree of strength as well as dexterity is required in the working of butter. The thing wanted is to force out the milk entirely, with as little tawing [working] of the butter as possible, for if the milk be not entirely taken away, the butter will spoil in a short time; and if it be much worked the butter will become tough and gluey, which greatly debases its quality.

Before you put butter into the vessels which are to contain it, great care must be taken that they be well seasoned by frequent washing and exposure to the air for two or three weeks. As it is difficult to season new firkins, it will always be preferable to employ those which have been used. The most speedy method of seasoning firkins is by the use of unslacked lime, or a large quantity of salt and water well boiled, with which they should be repeatedly scrubbed, and afterwards thrown into cold water, to remain there three or four days till wanted. They should then be scrubbed, as before, and well rinsed with cold water; and before the butter is put in, every part of the inside of the firkin must be well rubbed with salt.

Butter may be salted by working into it one or two ounces of salt, after the butter milk has been forced out. The salt should be thoroughly incorporated, and be of the best and purest quality. Dr. Anderson, however, recommends the following preparation, which he has experienced to be much superior, as it not only prevents the butter from becoming in any degree rancid, but also improves its appearance, and imparts a sweeter and richer taste than could be given by common salt only. For every pound of butter take half an ounce of best common salt, one quarter of an ounce of loaf sugar, and one quarter of an ounce salt petre; beat and blend the whole completely together. Butter thus cured, should stand three or four weeks before it is used, that the salts may be well mixed. The best butter is made in summer, but by adding a certain portion, (which experience alone can determine) of the juice expressed from the pulp of carrots to the cream previously to churning, winter made butter will thus acquire the appearance and flavor of butter that has been churned during the prime part of the summer season.

FOREIGN.

LATEST FROM EUROPE.

Accounts have been received from London to the 16th, Liverpool to the 18th, and Gibraltar to the 14th of May.

By these it seems that the French have rather a *tough row to hoe*, and are likely to get more *kicks than coppers*, to pay for their toils and dangers in Spain. Already *crops of bayonets* have sprung and are springing up in every part of the invaded territory. This *iron harvest* the *workmen* of despotism must reap, or leave their master's *job* unfinished. We think it ten to one, if one in ten of the pioneers of arbitrary power ever meet with any better compensation for their labors than the *wages of sin*. Death will probably be paymaster general of the French forces, before they shall have accomplished as *hirelings* their day; and they will find a short way to their long homes before they have completed the *work* which tyrants have set them to do.

We are told that Moucey, one of the Spanish chiefs, has fallen back and gained a position between the rear of the French and the frontiers to cut off their retreat. This *manœuvre* has caused apprehension in Paris to become wide awake, and every body is on the look out for misfortune. The funds have fallen, the Parisians are chop-fallen, every thing which relates to national credit and prosperity is sinking, and if the government does not fall into a pit of their own digging, their fortune will be better than their deserts.

The Sun, a London paper of the 10th May, insinuates that the Emperor of Russia is not so much the friend of France as has been supposed, and that the Spaniards have nothing to apprehend from Russian hostility. And we are told in the same paper "that affairs are obviously approaching to a crisis, which must involve Europe in another general war;" and that "England will be forced into the conflict sooner than the public generally apprehend." We do not trifle with a subject so serious. In the highest political quarter it is now believed that our neutrality cannot be much longer maintained."

A letter from Madrid, dated April 30, states in substance that Saragossa was yielded to the French in consequence of orders from the Cortes not to defend it. The strongest enthusiasm in favor of Spanish freedom, and the most deadly hostility to France, pervades every part of Spain. It is evident that the French will not advance their cause one step by the occupation of Madrid. It will only be the moment for beginning hostilities.

Gen. Mina, it is said, has had a contest with Marshall Moucey in Catalonia, and much loss had been sustained on both sides.

A London article of May 16, states that alarms had prevailed for some days in the French capital, and did not originate in artificial but very substantial causes. Gen. Mina, by a rapid and apparently skilful movement, has placed himself between the French and their frontiers, and had gained on them more than a day's march at the date of the last accounts. This news caused a panic among the stockholders in Paris, which was in some degree quieted by a tranquilizing communication from the government, but it is predicted that it will not be a long time before the alarm will be again prevalent.

Still later from Spain.—The brig Canton, Capt. Tunison, arrived at this port on Wednesday, and brought news from St. And-ro, in Spain, to the 5th of June.—Bodies of Spanish troops, opposed to the Constitution, entered St. And-ro on the 27th of April, under Gen. Longa, and of French troops on the 3d of May, under Gen. Dabina. These troops entered and departed from that place several times. On the 20th of May, according to report, a great battle was fought within a few leagues of Catalonia. The two armies, it is said, consisted of about 20,000 men each. The loss of the French is stated to have been 5000 men; that of the constitutional army 3500. On the 22d May the men under Gen. Longa were all taken prisoners, by a party from the garrison of St. Antonio, which also captured a French detachment of 200 men, with from 400 to 500 mules laden with stores and ammunition, and 10,000 dollars in money, intended for the French army, which they supposed were besieging that place.

It is said that Capt. Tunison saw an official account of the battle of the 20th of May, which represented the French to have been completely defeated. The Spanish forces were commanded by Gen. Mina. The greatest enthusiasm prevailed at St. And-ro, and in the neighborhood, and even the females volunteered their services in the Constitutional army in defence of their country.

Straw Bonnets.—The Society of Arts (says an English paper) have voted Mr. Cobbett a medal for his communications on the subject of straw bonnets. The public have heard of seed imported from America, and sown here, in order to obtain the straw. Mr. Cobbett has produced straw and plat from grass which grows all over this kingdom, and that plat surpasses even the American plat. In short, he has demonstrated that the people of this country may at once set to work and supplant the Italians in the making of bonnets.

DOMESTIC.

Gold Mine.—A gold mine has been discovered in the County of Anson, (N. C.) two miles from Rocky river. The ore is said to be very pure, and sells in its crude state at 91 cents the pennyweight. A piece has been dug up weighing 40 oz. valued at \$720; and another piece weighing 22 oz. worth \$340, 40 cents.—Gold is found no deeper than three and an half feet below the surface.

Silver Mines.—Late accounts from Washington Co. Missouri, inform (says the Lexington Gazette of the 5th inst.) that a trading party was forming to visit Santa Fee, in Mexico, and also to open a silver mine which was discovered last summer high up the Arkansas river. The quantity and richness of the mineral affords the most flattering prospect of a very extensive manufactory of silver within the limits of the U. States.

Strawberry.—The Raleigh Register states that from a garden in the vicinity, there was lately gathered in ten successive days 100 quarts of strawberries.

Extraordinary effects of Lightning.—Mr. Jas. Teague of North Carolina, was struck by lightning on the 5th inst. while walking in his field. His hat was torn into fragments, and some of them propelled on every side to the distance of 30 feet—twenty-five of the fragments were collected. His body was scorched and burnt from head to foot; his left shoe torn into three pieces, one of which was found forty feet from the place where he lay; his shirt was on fire when he was discovered.—The electric fluid in passing from him, entered the ground, making a hole 1-2 inch in diameter. By the use of friction and the warm bath for about forty minutes, however, the sufferer revived, and has since gradually recovered.

Thunder Storm.—On the 18th inst. a heavy thunder storm, accompanied by hail, and a violent gust of wind was experienced at Boxford and Bradford, in this State. At Boxford a great number of trees were prostrated, a stone wall blown down, and a barn belonging to Mr. Barnes, demolished. At Bradford, Capt. Joseph Symonds, who was at work in his field, was instantly killed by lightning. On the evening of the same day, the house of Dr. Caleb Fiske, of Scituate, R. I. was struck by lightning. Four persons were sitting in the two lower rooms, at the east end of the house, with the windows open, one of whom, leaning on a window, was considerably injured by the shock.

Bonfire.—Notes of the bank of the Commonwealth of Kentucky, to the amount of one hundred thousand dollars, were consumed by the flames at Frankfort, on the 27th ult. in pursuance of an act of the Legislature.

The Legislature of Rhode Island have laid aside a proposition, respecting Steam Boats, until the decision of the U. S. Supreme Court, on the same subject, is made. They have also rejected a bill for taxing Steam Boat Passengers. A charter has been granted to the Blackstone Canal Company.

Clouds of Flies have made their appearance in Mobile, and are so numerous as to cover whole sides of horses, and impede passengers in their progress through the streets.

English Cast Steel Grass Scythes, &c.

JUST received and for sale at the AGRICULTURAL ESTABLISHMENT, No. 20, Merchants' Row,

Twenty dozen Cam's superior Cast Steel Scythes—10 do. Passmore's do.

Also—A further supply of Stevens' patent steel spring 2 and 3 tined Hay Forks; together with a great variety of Ploughs, Rakes, Hoes, &c. &c.

Likewise—3 of Stafford's patent cylinder Churns.

June 21.

TREATISE ON AGRICULTURE.

ONE set of BEATSON'S TREATISE ON AGRICULTURE, for sale at the Agricultural Establishment, No. 20, Merchants' Row. June 21.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but those who pay within *sixty days* from the time of subscribing will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the Publisher) until arrearages are paid.

Complete files from the commencement of the paper in August can be furnished.

Agents who procure seven subscribers, and become responsible for the payment, will be entitled to a copy gratis, and in the same proportion for a larger number.

THE FRENCH PEASANT.

When things are done, and past recalling,

'Tis folly then to fret and cry,

Prop up a rotten house that's falling,

But when it's down, 'twill let it lie.

O, patience, patience, thou'rt a jewel,

And like all jewels hard to find;

Amongst all the various men you see,

Examine every mother's son,

You'll find they all in this agree,

To make ten troubles out of one.

When passions rage they heap on fuel,

And give their reason to the wind.

Hark, don't you hear the general cry

"Whose troubles ever equal'd mine?"

How readily each stander by

Replies, with captious echo, "mine."

Sure from our clime this discord springs,

Heaven's choicest blessings we abuse,

And every Englishman alive,

Whether duke, lord, esquire or gent.

Claims, as his just prerogative,

Ease, liberty, and discontent.

A Frenchman often starves and sings

With cheerfulness and wooden shoes

A peasant of the true French breed,

Was driving in a narrow road,

A cart with but one sorry steed,

And fill'd with onions, savory load!

Careless he trudg'd along before,

Singing a gascon roundelay—

Hard by there ran a whispering brook,

The road ran shelving towards the bum,

The spiteful wind th' advantage took,

The wheel flies up, the onions swim.

The peasant saw his favorite store,

At one rude blast all puff'd away.

How would an English clown have sworn,

To hear them plump, and see them roll,

Have curs'd the hour that he was born,

And for an onion d—d his soul!

Our Frenchman acted quite as well;

He stopp'd, and hardly stopp'd, his song;

First rais'd his bidet from his swoon,

Then stood a little while to view

His onions bobbing up and down;

At last he, shrugging, cried "Parbleu,

Il ni manque ici que de sel,

Pour faire de potage excellent."

* Nothing is wanting here but salt, to make excellent broth.

A CLERGYMAN'S ADDRESS TO MARRIED PERSONS AT THE ALTAR.

You, who are the husband, must treat your wife with delicacy and tenderness. Nothing in nature is so *endearing*, so *winning*, so *captivating*, as tenderness; nothing creates aversion so soon, so strong, so inveterate, as rudeness, indifference, or disrespect. She is the weaker vessel and depends on you for protection and comfort in all her difficulties. For *your sake* she has left her friends, her connections and all the world; and should she meet with a tyrant instead of a lover, she may repent of this day as long as she lives. Never incense nor insult her; and as you wish to keep your own temper and peace, ruffle not her's; for crossness and asperity, especially when they settle into moroseness, and ill nature, are the qualities of a savage, not of a christian. Never, on any pretence whatever, squander that in dress, drinking,

or dissipation, which you should lay by for the benefit of your family. By all the laws of God and man, of justice and love, they have an exclusive claim on whatsoever you can earn, and every unnecessary indulgence which you take apart from them, is at their expense and injury. Consult your wife, especially in all cases of difficulty; 'tis her interest as well as *duty* to give you the best advice she can. Never keep her ignorant of your circumstances; this has been the undoing of millions of families. The wife who deserves the name, will not *fail to economise*, when she knows that her partner's circumstances require it. Be not much uneasy though the world should sometimes think she has her full share of influence. Women of good sense seldom abuse their husband's confidence. And you will see few happy families in which the wife is either a slave or a cypher.

Mutual happiness is your mutual object; yield therefore to one another. *Be ye equally yoked*, is the command of God; but neither seek basely to throw an undue weight on the other's shoulders. Suffer no *interference* from any quarter to interrupt your harmony; you are connected for life.—Nothing can separate your lot in this world; O let nothing divide your affections; regard each other with the fullest confidence; the least spark of suspicion from either, must forever blast the comfort of both.—There can be no harmony where there is no faith.

A wife should not only love her husband, but on every occasion shew him all the attention in her power. Study by every means to make his home comfortable, and inviting. *Where the treasure is, there will the heart be also*, and a man's presence, as well as *his heart*, will always be there most, where he has most pleasure. And I will venture to assert it as a fact incontestible, that he who finds his home a *paradise*, will seldom stroll into the wilderness of the world.—While on the other hand, a scolding wife and a hot house have driven many a wretched husband to a tavern, where cards, women, and wine, have sealed his own and the *destruction of his family*.

NOBILITY—NOMINAL AND REAL.

There is a story running through the papers, that Matthews, the famous stage player and mimic, being in company with his "majesty of England," when regent, the latter offered his box, requesting that the player would *oblige* him (the regent) by taking a pinch of snuff.—On which the other desired that the regent would open his *royal jaws* a little wider, and say *oblige*.

The Boston Patriot, noticing this tale, put aloft to honor the player, asks us to "figure George Washington laughing and holding his sides at the mimicry of Charles Matthews, and standing before him to have his pronunciation corrected, in the manner stated." The idea is intolerable. The eye of Washington, in a case like this, would have sunk the impertinent as through the floor, and all his pranks and gibes and jeers would have been lost in reverence, had he stood in the presence of that *noble man of nature*, and perhaps no man that ever lived had a countenance more strongly marked with what is called "dignity," than the father of our country. He was sedate and steady, yet not austere—but never losing sight of self-respect,

he exacted it of others, without being sensible that he required it: and it is hard to suppose that any person, with the least pretension to character or standing in society, should have spoken to him as Mr. Matthews is said to have done to the ruler of kingdoms.

A notice of the manner and appearance of Washington, brings to recollection an incident that I myself witnessed, and which, because it relates to *him*, may be worth mentioning. The gentleman with whom I served my apprenticeship, in Philadelphia, kept a Book-store, as well as a Printing Office, at his house in Market St. He would not have more than two or three lads in the office, and liberally allowed us free access to the store for the use of his books. As I had a regular weekly task that I always performed, it was my practice to rise early in the summer and seat myself at the front door, where I enjoyed the fresh air, and read generally about an hour before the rest of the family were stirring, and when but few persons were to be seen in the streets. While thus occupied, Washington often passed me in his morning walk, and from repeatedly seeing me at the same place, and in the same employment, frequently seemed to give me an encouraging look, if our eyes happened to meet; to which he would sometimes add a kind nod of recognition. One fine morning, just before the door I was sitting at, he was met by two apparently respectable gentlemen, whom, at the first glance, I put down for foreigners, just arrived in Philadelphia.—They stared at him with remarkable eagerness, making a full halt to examine him, spontaneously, as it seemed to me, raising their hats. The general made a slight bow, as he passed they then rushed eagerly up to me, and asked "what gentleman is that?" I simply replied "Washington." One of them then said, "By —, it is the most majestic man that ever I beheld;" and they both rushed through the market house, retracing their steps, that they might meet and look at him again. By their dress manners and dialect, I thought that they were recently from London.—*Niles' Register*.

FIRST BOOK AUCTION.

The first book auction in England, of which we have any record, is of a date as far back as 1676, when the library of Doct. Seaman was brought to the hammer. Prefixed to the catalogue, there is an address, which thus commences: "Reader, it hath not been usual here in England, to make sale of books by way of auction, or who will give most for them; but it having been practised in other countries, to the advantage of both buyers and sellers, it was therefore conceived (for the encouragement of learning,) to publish the sale of these books in this manner of way."

The celebrated doctor Saunderson, the blind mathematical professor of Cambridge, being in a very large company, observed, without any hesitation or inquiry, that a lady who had just left the room, and whom he did not know, had very fine teeth. As this was really the case he was questioned as to the means he employed in making such a discovery. "I have no reason to think the lady a fool, said the doctor and I have given the only reason she could have, for keeping herself in a continual laugh for an hour together."

NEW ENGLAND FARMER.

PUBLISHED BY THOMAS W. SHEPARD, ROGERS' BUILDINGS, CONGRESS STREET, (FOURTH DOOR FROM STATE STREET.)

VOL. I.

BOSTON, SATURDAY, JULY 5, 1823.

No. 49.

From the Massachusetts Agricultural Repository.

DR. T. W. HARRIS, OF MILTON, UPON THE NATURAL HISTORY OF THE SALT-MARSH CATERPILLAR.

In the present state of agriculture, hay has become an important product to the farmer in this vicinity. From the high price and the increased demand for the imported and cultivated grasses, the indigenous and natural growth of the soil must rise in value; and of this perhaps none is more valuable, on the seaboard, than that of the salt-meadows.

But various causes have contributed to disappoint our hopes in the crop of salt-hay, and among those, the most apparently unavoidable are the ravages of insects. Of these, the caterpillars and grasshoppers have become the most formidable, by the great extent and the annual increase of their devastations. Meadows, where they have foraged, are entirely stripped of their covering; every green blade disappears before them;—what the caterpillars have left being devoured by the grasshoppers.

The object of this paper is to attempt to elucidate the natural history of the former of these insects, with the hope that it may lead to some sure method of exterminating them, or of limiting their ravages to a shorter period.

Caterpillars were observed, upon the salt-marshes, bordering Charles' river, near Cambridge, some ten or twelve years ago; since which time they have gradually multiplied and extended over the contiguous marshes. They were once by a high tide and strong wind driven upon Boston-neck, near to Roxbury line, where they laid in "winrows," apparently dead; but after the storm had abated they were resuscitated by the heat of the sun, and commenced their depredations anew, overrunning gardens in that vicinity and destroying every green leaf in their path. Thence, I presume, they migrated to the eastern side of the neck, and have followed the meadows as far as Quincy. To what distance they have spread on the north of Charles' river, I have yet to learn. They are also found on the marshes in Kingston; but probably originated from a different source from those in the environs of Boston.

The salt-marsh caterpillars are produced from eggs, laid by moths in the middle of June, which are hatched in the air, in seven or eight days afterwards. These eggs are nearly round, less than a grain of mustard, and about eight hundred in number from one female. The caterpillars are small and feeble at first, eating only the most tender part of the blade of grass; but rapidly increase in growth, and, in seven weeks or fifty days,* attain their full size, having repeatedly cast their skins. Individuals, at this period average one and three quarters of an inch in length. While growing they change the colour of their hair very remarkably;—being nearly of a mouse colour when small, and of a brownish hue when fully grown. Of these,

at maturity, there are two shades; some being of a dun colour, and others much darker.

The body of all true caterpillars is divided into twelve segments besides the head.

Each segment, in this insect, is covered with twelve yellowish tubercles, arranged, rather irregularly, six upon each side: from these proceed the hairs, giving the predominant colour. The tubercles appear to be analogous in function to the bulbs of the hair in the human subject: they are, in truth, but common bulbs, from which tufts of hairs grow and are nourished, in the same way as each single hair grows and is nourished from its appropriate bulb. Between the third and fourth tubercle, on each side of the median* line, is a stigma or spiracle, of which there are eighteen, or two in every segment of the body, except the second, third, and last. The spiracles are the organs of respiration, and are the same, in number, in all the true caterpillars.

The colour of the body, divested of the hair, is yellow, shaded at the sides with black; and there is a blackish line extending along the top of the back. The spiracles are white and very distinct.

The hair proceeding from the three uppermost tubercles, on each side of a segment is almost black, as well as that from all the four first segments of the body. That from the tubercles on the sides is of a much lighter shade. On the two last segments of the body the hair is much longer than the rest.

This caterpillar, like most others, has eight eyes, four upon each side of the head. These are not to be distinguished without the aid of a microscope. They are situated just above those white feelers, so plainly seen attached to the upper lip. The eyes are here arranged in a semicircle, whose convex side is directed anteriorly.

The jaws are two, strong and corneous, and their operation, in eating, may be distinctly heard as well as seen.

It has sixteen feet;—six anterior and horny, and ten posterior and fleshy. These enable it to run with considerable celerity, as we may see, when the insect is at its full size; at which period it commences the wandering state, and leaves the meadows in search of a place of security for forming its cocoon.

These caterpillars are endowed with a great degree of vitality; for long immersion in water does not destroy life. Being often exposed to that element, they seem provided with the power of enduring its approaches. They feed twice in the day; about ten o'clock in the morning, and four in the afternoon. If overtaken by the tide while feeding, they mount to the top of the grass; and then, if obliged to relinquish their hold, contracting themselves into a circular form, they commit themselves to the water. On this they float and are carried to the superi-

or parts or borders of the marsh. There they are left, with the wash of the sea, in heaps, but alive, and in a short time ready to recommence their depredations upon the meadows. But when not engaged in feeding they conceal themselves at the roots of the grass, where they are equally secure from the effects of the water, even though covered by it. In this way also they pass the night. The hair, upon their bodies, appears to possess a repelling power, which secures the spiracles from the admission, or access of the water; for, were this to be the case, the insect would be drowned. We should suppose that the tide, on receding, would sweep away many of these insects; but this is not the case: for in consequence of the irregularity of our shores, and of the power, which these caterpillars have of remaining, uninjured, on the surface of the water, for a long time, they generally gain some place of lodgment and safety.

Their most favourite food is the '*Onion grass*,' which is very succulent;* but they are not fastidious, and eat with avidity '*Forx*' and '*Bottom-grass*,' and even '*Thatch*' and '*Sedge*.' Of the '*Black-grass*' they are not so fond, probably because it ripens sooner than the others, and is found nearer the upland, and thus, before it is reached, it becomes too dry to furnish the juices by which they are nourished.

By the first of August, generally, these insects have attained their greatest size. They now become very voracious, and continue eating all the day and night, without intermission. Soon they leave the meadows, aggregated in great numbers, and commence the wandering state, or 'begin to run,' as is the phrase, devouring every thing in their progress. Corn fields, gardens, and even the coarse and rank produce of roadsides afford them temporary nourishment, until they have found a place of security from tide and weather, and concealment from their enemies of the animal creation. A stone-wall, a wood-pile, fencing-stuff, and even hay-mows and stacks are the resorts of these caterpillars, where they intend to take up their winter quarters, and construct their cocoons. I have heard of their being dug up, in vast quantities, from the ground upon the edge of a salt-marsh; but, in this instance, it is probable that, being prevented by ditches in their attempts to escape from the marshes, they were prompted by instinct to take refuge deep in the bank.

The cocoons are formed of silk interwoven with the hairs of their bodies, and lined with a silky lamina of a dense texture. These cocoons retain the colours peculiar to the caterpillar: those being brown, which are fabricated by the dark larva, and the others much lighter coloured. If we examine the recent cocoon, we shall find the caterpillar within it entirely destitute of hair, and much contracted. In a few days it casts its slough, and becomes a chrysalis, of a dark brown colour, and about three quarters of an inch long. In this state it passes the win-

* It is so full of juice as to be with difficulty dried.

† *Triglochin maritimum*, L. sometimes called the sea arrow grass. This is considered by Mr. Lowell as the most valuable species.

* They continue in the feeding state about as long as the apple-tree caterpillar, which is produced by the *Phalena Neustria* of Linne.

* I have taken the liberty to employ this phrase, which is a technical one in Anatomy and Physiology, for that line which divides the animal into two equal and symmetrical halves, and I would indicate by it a dark line running upon the top of the back, the whole length of the body of this insect.

ter. and, within the first and twentieth of June, the moth emerges from its chrysalis and cocoon, and flies towards the meadows; where, after the hymeneal rites are celebrated, and the eggs deposited, it dies.

The moth is the perfect state of the insect.—There are two varieties, as to colour, corresponding with the caterpillars from which they are produced. From the dark caterpillar and brown cocoon proceeds a moth with ash-coloured wings; and, from the lighter coloured larva and cocoon, is disclosed a moth whose upper wings are white, as are also the under wings in some individuals. These colours do not designate the difference of sex: for though the upper wings of the male are invariably white, those of the female are not as invariably ash-coloured; but this difference or variety of the female will be more distinctly described below. I would also mention that the male, and the light-coloured variety of the female, both proceed from caterpillars and cocoons of the same colour.

The male moth will be first described.

Head and throat white; eyes black; antennae black, and doubly pectinated. Body orange-coloured, with six black spots on the top of each ring, and a white line between a double row of black spots on each side;* beneath the abdomen is a single series of four or five small spots: tail white. Upper wings white above, orange coloured beneath, spotted with black upon both surfaces: under wings both above and beneath orange-coloured, with a few large black spots. Thighs orange coloured; legs and feet white, spotted or banded with black.

Female—Head, thorax, tail, both surfaces of the upper and under wings, under part of the abdomen, and the thighs entirely ash-coloured. The wings are spotted with black. Upper part of the abdomen as in the male. Antennae doubly (but slightly) serrated, not pectinated.

Variety of the female—Head, thorax, and tail, white. Upper part of the body as in the male. Upper and under wings white upon both surfaces, and spotted with black. This variety very much resembles the male, when the wings are closed, for then the under wings are not to be seen. It is however easily distinguished from the male by its antennae which are serrated; and when we examine the under wings, and the inferior surfaces of the upper wings, and body, we find them to be destitute of the yellow or orange-colour, peculiar to those parts of the male.

I would only add to this description, that the moth, of both sexes, are furnished with a short tongue, separable into two filaments; and have also two scaly palpi, above the mouth.

This insect is closely allied to several others, very common in Europe, and some of which are also found here; such as *Bombyx erminea*,† &c. These form one family, and are arranged under the genus *Arctia* of Latreille, and Leach. This genus contains those moths, which have two scaly feelers; pectinated or ciliated antennae; a short membranaceous tongue, composed of two separate filaments; and trigonate, deflexed wings; the caterpillar having sixteen feet.

Professor Peck, to whom this moth was shewn, considered it as a nondescript; and proposed to call it *pseud-erminea*, bastard ermine, from its af-

finity to the above mentioned *Bombyx erminea*.* I would therefore define the subject of this memoir.

Arctia (*pseud-erminea*) *alis masculis anticis albis; posticis fulvis, utrisque nigro punctatis; tergo fulvo, sex maculis nigris supra notato; ventro quinquefarie nigro punctato. Fœmina variat alarum colore.*

Larvæ gregatæ; verrucis luteis piliferis.

Pupa folliculata.

Interdum maculam septimam super postrema corporis parte videmus. Fœmina alis (anticis posticisque concoloribus) albis vel cinereis, nigro punctatis.

There are two facts, in the history of these caterpillars, that should be ascertained. First—the place where the eggs are deposited; this I have not as yet been able to discover; those eggs, which I obtained, were laid under glass vessels upon paper. Probably they would be found around the culm of the grass, or regularly arranged upon the leaf. Secondly—whether, by bringing home, with the hay to our barns, the caterpillars when fully grown, we are not liable to introduce them eventually into our uplands, where they might become as it were naturalized; and thereby increase the evils we already suffer from their devastations. This we have some reason to fear; since we know that the caterpillar at one period, (and that sometimes for several days,) feeds indifferently upon all green herbage. Some observations, made upon doubtful specimens of the larva and perfect insect, found occasionally on the upland, favour this opinion. The peculiarities in the appearances of these specimens may possibly have arisen from a want of the food most natural to the caterpillar. Still both these points are as yet merely matters of conjecture; further examination must establish or refute them.

From observation and experience I would recommend the following plan, by which we may lessen the evils that we suffer from this enemy.

First, to cut the grass early in July; and secondly, to burn over the marshes in March. In defence of early mowing, it may be said,—that it is the only way by which we may save the crop from those meadows where the caterpillars have multiplied to any extent. The preceding history furnishes the data, from which to calculate the best time for affecting this purpose.

We have seen that the caterpillar is hatched about the twentieth of June, and that its ravages are continued seven weeks. If then the meadows, in one vicinity, are mowed about the fourth of July, the caterpillars, being small and feeble, will be deprived of their means of nourishment, and being unable to wander far, will die, before the crop is gathered into the barns. By the process of making the hay, most of the succulent juices are evaporated, and the grass becomes so dry and hard as to resist the efforts of these little devourers. Thus we see that the Black-grass, by ripening early, is rejected by them, and the crop is saved.

By the practice of late mowing, where the caterpillars prevail, the crop is diminished, immense numbers of caterpillars and grasshoppers

are left to be dispersed upon the uplands, to multiply and increase the existing evil; or are brought in to perish in our barns and stacks, where they communicate a most unpleasant flavour to the hay, rendering it unpalatable to our stock, and occasioning a waste of fodder.

Many beneficial effects result from burning over the marshes in March. This has been long practised in the British province of New-Brunswick, and is getting into use in this vicinity, to the manifest improvement of the crops. By it the stubble or “old fog” is consumed, which becomes more necessary from early mowing, in the preceding year. By this means also we may destroy innumerable eggs and larvæ of grasshoppers concealed in the grass* the past autumn, and which, if matured, would produce a host more formidable than that of the caterpillars themselves. The roots of the grass are not injured by burning the stubble; they are fertilized by the ashes, and in a short time afterwards we shall be gratified by seeing the grass springing from the blackened surface with increased strength and fresher verdure.

The preceding observations on the history of these insects, are the result of the inquiries, investigations, and experience of the writer for several years; and the practice here recommended is one that was first suggested by necessity, and whose good effects have been reaped by many.

This little memoir is offered to members of the Massachusetts Agricultural Society, with the humble hope that they may derive some profit from what has been a pastime to the author.

PASTEL, OR WOAD, AND ITS CULTURE.

We insert with great pleasure, the following communications on the culture of Woad, (*Isatis Tinctoria*.) and General Dearborn will permit us to express our sense of the obligation which the public are under to him, for his continued efforts to introduce the cultivation of this plant, now so important to our manufactures. During the late war, General Dearborn made some interesting experiments on a small scale, to prove the practicability of raising this important dye-stuff in the United States. Though his experiments were not extensive, they were entirely satisfactory. He did more. He compiled and wrote, and published at his own expense, a treatise on the culture of this plant, which contains all the information necessary for a cultivator of it. The peace came; with it, low prices; and the subject lost a portion of its interest. But great changes have been wrought during the last seven years, and the culture of woad has again become a subject of deep interest. The fact, that an extensive manufacturer, like Mr. Crowninshield, has found it for his interest to cultivate this plant, and has proved its value practically, seems to set the question at rest. We invite our cultivators generally, to read with attention these communications, to procure Mr. Dearborn's work on Woad, and to make some moderate experiments upon this article.

Mr. Dearborn's letter to Mr. Lowell, April 9, 1823.

Dear Sir—I inclose a letter from Richard Crowninshield, Esq. on the cultivation of woad, which, if you think proper, please to cause to

* The upper consisting of six, in number and size corresponding with those on the back, and the lower of 4 or 5 spots which are smaller than the former.

† *Arctia lubricipeda*, Leach, *Arctia Menthastri*?

* *Bombyx* (*Menthastri*) *alis deflexis albis nigro subpunctatis; abdominis dorso fulvo, nigro punctato; femibus anticis luteis.*

Abdomen album, quinquefarie nigro punctatum; dorsoque fulvo. Antennae subtus nigrae.

Fabr. Entomolog. Systematica.

be inserted in the Agricultural Journal. It is the largest experiment that has been made in this section of the country. It shows that our manufacturers can raise this valuable article for the dyeing vat, at little expense, and with great ease.

With great respect, your most humble servant,
H. A. S. DEARBORN.

Extract of a letter from Richard Crowninshield, Esq. of Danvers, to Brigadier Gen. Dearborn, dated March 29, 1823.

"I planted about 5 acres with 9 bushels of woad seed, in 1822, some of which seed you was so obliging as to present to me. The remainder was procured from Connecticut, New-York, and some were of my own raising in 1821, from seeds received from Dr. Nichols, in 1818. There was no difference in the plants raised from these several parcels of seeds. The soil was light, dry and sandy. The land was broken up in the spring of the same year. The sods were removed, and the land crop ploughed, harrowed, and furrowed out 2½ feet between the furrows. About 40 cords of good compost manure, (consisting of horse dung, cow dung, and pig manure, mixed with about one fourth part of its bulk of bog turf, which had been in heaps about two years, with some ashes, lime, &c.) were spread on the land and ploughed in as for Indian corn; the furrows were slightly earthed. The quantity of seed two bushels to the acre. They were sown rather thickly in the furrows, in order that in gathering them, there might be a full handful of plants to crop at the same time. The seed was lightly covered. It was all sown before the 20th of May. It grew well, but required five or six men to keep down the weeds in July. It was all picked or twisted off quite to the ground. It was then again cleared of weeds, and in 14 days the new leaves were from 9 to 14 inches long in rich spots. The second crop was gathered from the 15th to the 20th of August, and produced about four tons of green leaves, about one ton less than the first crop. The dry weather prevented a third crop from being taken. Some leaves were however taken in October, 5 inches long, but I preferred to let them generally remain to protect the plant against the frost, having the last winter lost an acre of woad, and an acre of teazels, by frost. The loss in woad was much less than in the teazels; the plants which I lost of the latter would have sufficed for four acres, and have produced much money, being worth from 50 to 75 cents for every hundred plants. All the woad plants are now alive, (that is, on the 29th March, 1823,) and have grown half an inch. I have also many thousands of teazel plants in good order.

"The expense of cultivating woad is about equal to that of cultivating onions, and ten men will crop an acre in a day.

"There is something remarkable in the woad plant. Some roots which produced seeds last year, sprouted again from every joint like cabbage sprouts. They are now again sprouting from under the snow, the leaves are green, and may again be cropped this spring. I shall have a great quantity of seed to dispose of at \$1.50 per bushel. I paid two dollars. There are but few men in America who understand, perfectly, the preparation of woad for the dyer. Our farmers, should it become the policy of the nation to

raise and manufacture our own woollen goods, equal to the national consumption, will probably find it for their interest to raise woad, and deliver it green or dry (as may be most convenient for them) at regularly established mills, exclusively devoted, as in England, to this article. Inclosed you have an article from the N. York Statesman on woad."

The article referred to from New York, is interesting, and is, therefore, here inserted.

N. B. General Dearborn has still a few copies of his work at the command of persons disposed to cultivate the woad.

AMERICAN MANUFACTURES.

Extract of a letter from Cincinnati, Ohio, to the editors of the Statesman.

"Having seen several communications in your valuable paper, respecting the art of dyeing, and the cultivation of the woad plant, by which it seems that manufacturers in your part of the country are doubtful whether woad can be produced in the United States in the same perfection as in England, I have thought proper to state, for their information, that in 1821 I planted two acres, and found the produce to be at least one fourth more in quantity, having cut seven crops during the season. In England, I never knew more than five. Its strength, as a mordant, exceeded the English at least one third, containing three times the coloring matter I have ever found in any woad, after an experience of forty years, in an extensive trade in England.

I herewith forward to you some patterns of wool, dyed with this woad, and regret I had not preserved some colored with woad only, by which artists acquainted with the subject would know its superior qualities. I have always observed in England, that our woad plant produces more in quantity and better in quality, in a warm season; and I attribute its great perfection here to the same cause.

Your manufacturers of woollens cannot fully succeed until they become well acquainted with this useful plant, as no good blue, black, green, or purple color can be produced without it.—All other modes are imperfect, expensive, and mischievous. Having made this country my home, I shall take pleasure in communicating this knowledge, to any one that may need it, for a moderate compensation. Written directions may be given for growing and preparing woad, without any chance of error; but to use it properly, requires considerable attention and good instructions.

I suppose it may be produced for three or four cents per pound—perhaps for something less. I have sold some of mine at Baltimore, this season, for 12½ cents, by which you will perceive there is great profit in its cultivation. In my opinion no substitute for woad will be found worthy of attention, although it seems your friend Hopson thinks he has discovered one, which will answer the purposes both of woad and indigo. Your correspondent will confer a favor on me, by giving a description of the wild indigo plant, as he terms it. I will investigate its properties, and communicate the result to him.

Your correspondent who has written on the scarlet dye, appears to be acquainted with only a part of the theory of that art, as two essential ingredients are not mentioned, one of which I

have seen since my arrival in this country.—Your friend is also in an error in supposing he can render color more brilliant by using steam. I have made use of steam in dyeing for nearly thirty years, and am well acquainted with its advantages and disadvantages. It is a cheap and expeditious mode; but it cannot be used for fine colors, such as Saxon blue, green, pink, crimson, scarlet, orange, yellow, and all other delicate colors, but at the expense of its beauty.

All dyers should know, that when bright colors are wanted, the first step to be taken is to clear the water of all mineral and animal substances. This is all that is necessary to prepare the liquor for any bright color; but if raw water be added, or steam suffered to flow into the vessel, the beauty of the color will be destroyed, in proportion to the quantity admitted."

The letter, from which the foregoing is an extract, adds a number of other particulars connected with the subject of manufactures. It states, among other things, that large quantities of Fuller's Earth are said to be found on the banks of the Wabash; but after diligent search, none, in a pure state, has yet been discovered in the vicinity of Cincinnati. Our correspondent has put to us the following questions, to which we hope some one will furnish satisfactory answers, as we are unable to do it ourselves:

1. What quantity of woad would be consumed annually, in the vicinity of New York and Philadelphia, estimating one pound of woad to five pounds of wool, dyed of a dark blue?

2. Would the manufacturers give a reasonable compensation to be instructed in the art of dyeing generally?

3. Whether it would answer any good purpose, for a person who understands the manufacture of woad and its various applications in the art of dyeing, to establish himself in this part of the country?

It is proper to remark, that we are wholly unacquainted with the writer of this letter; nor have we a sufficient knowledge of some of the topics embraced in his communication, to judge of the accuracy of his remarks. Hopson will be able to speak for himself, where his correctness is questioned.

The beautiful specimens of coloring, accompanying the letter, may be seen at this office, where the name and address of the gentleman who forwarded them may be obtained.

To the Editor of the American Farmer.

Fort Osage, (Missouri,) April 2, 1823.

"I am, at this moment, experimenting in my nursery. I have grafted apples on sycamore and cotton tree stalks, close to the roots. I am told that the most flourishing and surest orchards of apples in the west, are growing on sycamore roots. I am trying peaches on the wild plum, and shall, by recommendation of one of my neighbors, graft some peaches on stocks of the common black walnut. This neighbor of mine assures me, that he has seen a very old and flourishing peach tree growing on a walnut—it is easy to try it; and should it succeed, perhaps we may be able to obtain durable peach trees—at least, we shall escape the annoyance of the worm. I am determined to try all manner of ways to procure a good permanent peach orchard. The result of such of my experiments as prove successful, shall be made known to you in due time."

From the Baltimore Morning Chronicle.

TO THE PUBLIC.

As the season of the year is approaching, when persons owning horses become alarmed, in consequence of these animals passing off bots with their feces, I have thought proper to endeavor to remove such fears, by laying before the public some facts which I have noticed in the course of twenty-four years experience.

Bots are generally found adhering to that portion of the horse's stomach, which is lined with a continuation of the cesophagus membrane, to about one third or little more of its extent; sometimes they are found attached in great numbers to the pylorus, or the posterior opening of the stomach. The time that horses begin to pass them off, is generally in June, and so on through September to October. The bot remains in a chrysalis state for an uncertain, but short time, and then assumes the same character as the parent fly. To prove, without the possibility of doubt, that the bot is produced from the fly which deposits its ova on the hair of the horse, I took twelve bots that came from twelve horses; these I put into separate vials, and with paper wrapped round a quill barrel, I made stoppers to give ventilation, and noted on each vial the day that each bot came from the horse; this was convincing as to the uncertain time of the chrysalis: for some produced the fly in twenty-one days, others in forty-nine days, and others in the intermediate time. The flies thus produced were the same as those that deposite their eggs so plentifully on different parts of the horse. What it may be that causes this difference of time in the chrysalis admits of speculation. It is proper to notice, that a bot taken from the stomach of a dead horse, cannot produce the fly, as in this stage of its progress through the canal, it is not sufficiently matured.

There is no worm that we know of, in the intestines of the human subject, which makes such an annual rotation; and in consequence of their long continuance in the intestines, we find numbers of the human family destroyed by them. Whereas, it may be presumed there would be few or none killed by worms were their rotation annual. And as bots perform this annual course, it can be no cause of surprise that they are not so destructive as they are commonly supposed to be. Was it a fact that they were thus destructive, we should find very few colts raised to the age of four years, for colts generally run out until they are considered ready for work, and are fully exposed thro' the summer to the action of the fly.

If a horse, by symptoms, expresses much pain, it is said to be the bots; and so much does this opinion prevail, that people imagine bots kill more horses than any other disease. If we reverse this opinion, we shall perhaps come nearer to the fact, for in all probability there is no disease that destroys so few. When he is said to be sick with bots, it is generally *spasm* or *inflammation* of the intestines. That bots never kill I will not assert, though there are eminent veterinarians in England who say they never do.

It is a common opinion, that a few bots are essential to the health of the horse. This erroneous idea arises from people opening but few after death, and those few being found to have bots in them. But in the many hundreds

that I have opened, there have been some in which not a bot was seen; and not one of these may be supposed to have died for the want of bots. The motive I have in making this communication is to remove the fears that prevail with some persons, when they see bots coming from the horse, as if they were so numerous as to kill him immediately. But for the information of such persons as would rather give something to facilitate their discharge, when they see a few coming away, I would advise one ounce of powdered safin, to be given in the horse's feed, once a day for three days. At the season above mentioned, I have recommended this medicine to such persons as I could not persuade to be satisfied with the course of nature; and they were very much astonished at the quantity of bots, brought off by it.

JOHN HASLAM, Veterinary Surgeon.
Baltimore, April 13th, 1823.

From the American Farmer.

Pittsfield, 6th June, 1823.

DEAR SIR—I have noticed an article in your No. 5, vol. 5, of "*a New Jersey Subscriber*," on the subject of Ruta Baga, in which he expresses his doubts, if it be a profitable crop, and gives his reasons.

Equally desirous with your correspondent of eliciting practical knowledge, I am induced to state, that five years experience, satisfies me that it may be raised to advantage, *wherever the climate is adapted to its culture*:—because,

1st. To raise a good crop it is necessary to put the land in a good state of tilth.

2d. The requisite care of the crop, while it extirpates weeds, prepares the soil in the best possible manner, for stocking to grass with the succeeding crop of grain.

3d. All kinds of live stock are fond of it.

And 4th. It affords a most succulent food, at a time (the spring,) when most wanted for every kind of stock.

Having remarked the advantages arising from the turnip culture in Europe, I was induced soon after entering on Agricultural pursuits, to give it a fair experiment, notwithstanding the general opinion in this section of the country, that turnips *could not be raised*, except on *newly cleared and burnt land*; consequently, they were only cultivated in a partial manner, and merely for culinary purposes.

In 1817, I selected for the purpose an acre in a field, that might be termed *worn out land*; that is to say it would produce a half ton of hay to the acre. The soil, a dry gravelly loam—gave it three ploughings and two harrowings before drilling—on the 24th June, manured with twenty-six loads of barn yard and hog's manure, and sowed the common English turnip—gave it a top dressing of about fifteen bushels slacked lime, and fifteen bushels leached ashes. It produced eight hundred and sixty-three bushels, and received the premium of the Massachusetts Agricultural Society. Very many of the turnips weighed from ten to twelve pounds; generally from six to eight pounds.

Having raised at the same time a small quantity of Ruta Baga, from seed procured direct from Russia, I was enabled to make a comparison of the relative value of the two kinds, and hence am satisfied, that with us at least (on account of our long winters and late springs) the Ruta Baga is preferable to the common turnip,

because the latter can only be used to advantage for fall feed, whereas the former will keep good through spring—and at this time I have them in perfection. It is true, an acre will not produce so many bushels of the Ruta Baga, as of the common kind of turnip, but that, I consider, as fully compensated, by the greater quantity of nutritive matter they contain.

Since 1818, I have raised the Ruta Baga every year, and may safely state, that, in no year has the crop been less than five hundred bushels per acre, and entirely free from worms.

Notwithstanding this favorable result, it is with much regret, I am obliged to add, that I am, as yet, almost alone in this county, in the cultivation of turnips as food for live stock, although our soil and climate are peculiarly adapted to them.

AGRICOLA.

The climate of New England is so much moister than that of the southern states, that we apprehend both potatoes and turnips may well succeed there, in seasons when they would fail even with us in Maryland. The suggestions above, are valuable and conclusive—however, as to New England, at least—and yet we see that even there, this great resource for winter feeding of stock is neglected. What immense advantages have resulted from the turnip culture to England. We regret that the communication from Agricola was not sooner received, but any thing from his pen will be at all times highly acceptable.—*Ed. Amer. Farmer.*

From the American Farmer.

WOOL.

In compliance with the request of one of your correspondents, I state, that I have just finished shearing a flock of 525 of mixed merino sheep, from which I have obtained, 2368 1-2 pounds of wool, free from tags, giving an average of a little more than 4 1-2 pounds. My average is not as great as it has been in former years, in consequence, (I presume,) of my flock's containing at this time, a larger proportion of breeding ewes than usual. I have always been in the habit of preparing my wool for market, by laying each fleece, as it is taken from the sheep, on a table, taking off all around, about two or three inches of the coarsest wool, which is reserved for domestic purposes, and rolling the remainder up very nicely and firmly, with the inside of the fleece turned out. The whole is then packed away in coarse bags; and a waggon, will at a single load take a thousand dollars worth of it to market. My wool, thus prepared, has been readily sold, for the last four years, at 40 cents per pound, in Alexandria; and I am very much inclined to think would bring a great deal more in the northern markets. But from some cause or other, we find it very difficult to ascertain the market price of wool in other places. I last year, made an inquiry through your paper, on this subject which was never answered. The growers of wool would certainly find it to their interest, to communicate freely with each other on this subject. And wool is now becoming too important an article, not to be entitled to some little attention, in a paper, devoted like yours, to the agricultural interest of the nation.

I have been told that during the last summer 70,000 lbs. of wool were imported from Europe into Boston alone, and sold, at public auction, at from 75 to 125 cts. per lb. Is this the fact? And if so, what was its quality and condition?

will not some northern wool grower reply to these inquiries; and tell us also the usual price of American wool in the northern markets? In no I have been told it readily commands from 75 to 100 cents.

I am no friend to any unnecessary commercial restrictions; but if Congress have thought proper to give encouragement to our manufactures, is there any consideration either of justice or state policy, which should withhold a similar encouragement from the raw material, which the manufacture is made of? F.

The Editor expects, with confidence, that the above article will attract the notice, and be viewed with an answer from several of his patrons in Connecticut and Massachusetts. How do gentlemen expect answers when they want information on some points, unless they communicate it when it is asked on other subjects, within their knowledge and experience?

Ed. Amer. Farmer.

NEW ENGLAND FARMER.

SATURDAY, JULY 5, 1823.

Farmer's and Gardener's Remembrancer.

JULY.

HORSE RAKE.—In our observations, (p. 373) on the subject of hay-making, we forgot to mention a machine for raking hay, which seems very well adapted to the purpose of saving manual labor. The following remarks and description of the machine we allude to were first published in the Pittsfield (Mass.) Sun, and re-published in the second volume of "Memoirs of the Board of Agriculture of the State of New York."

"The present period of low prices of products, and the necessity of economy, renders it expedient to inquire whether the labor of conducting our farms may not be abridged by the introduction of what are called labor saving machines. My attention has been called to the consideration of the subject. In one instance, viz. that of gathering hay after it is made, I am confident the labor and expense may be greatly abridged. In one or two sections of our country, the *Horse Rake* has been introduced and used most successfully. To satisfy myself fully on the subject, the last season and the present, I have had one in operation. It has exceeded my expectations, and I now recommend it to the immediate use of all our farmers. It will enable one man, with a steady horse and boy, to perform at least as much work in gathering hay into winrow and pile as six good men can accomplish, and as clean as is commonly done in raking by hand. The experiment which I have made will warrant this statement. The expense of the *Horse Rake* is small, not exceeding two dollars. It is constructed thus: Take a stick of timber, of say any stout wood. Ash, hessnut, fir, or spruce will be sufficient—ten feet long if your mowing lands are free of obstructions, and if obstructed with stumps or rocks, then shorten the head of the rake to our convenience. The rake head may be three and a half inches by two and a half diameter, or as you please. The teeth should be twenty-two inches long, and one inch by one inch and a half diameter, and set firmly into the head about two inches and a half apart. These teeth may be made of firm white ash, or wal-

nut, or oak. The teeth should be made at the end to turn up, so as to run on the ground like a small sled, and not into the earth. On the top of the head should be fixed about seven small standards, eighteen inches long, to prevent the hay falling over the head. In the centre of the head fix two handles, such as you have on ploughs, at a suitable distance, to guide and steady the rake. From the ends of the rake, extend a rope, of the size of a cart rope, to fasten the horse's collar. The distance of the horse from the rake may be such as to leave room for the hay to gather. Observation will soon direct the length of the ropes. Care must be used to have the teeth set even and firm, that they may run near the earth. This rake is used to collect the hay into winrow, or pile it—and it is useful in all grain fields to glean the scattered grain, and to lay down the stubble close to the earth to rot and promote putrefaction.

"P. S. A Horse Rake is in use on the farm of Thomas Gold, Esq. at Pittsfield."

The Farmers' Assistant likewise gives an account of this implement, corresponding with the above, and adds that "the teeth, when in operation, run along the ground nearly horizontally, with the points a little the lowest, so as to run under the hay, and as they take it up the upright slats retain it till the rake is full, when the man who follows it behind turns it over, and thus empties it in a row; then lifts it over the hay, thus emptied, and sets in beyond it; and so it proceeds on, till it is again filled, and the same process again repeated."

"When one strip across the piece is thus raked up, the horse is turned round, and another strip is raked in the same manner, emptying the hay at the ends of the last heaps raked up, so that in this way winrows are formed. When it is thus raked into winrows, it is dragged up by the rake into bundles large enough for making cocks."

HOEING CORN, GARDEN VEGETABLES, &c.—Some farmers hoe their corn twice, others three times, but it is believed that it is rarely hoed too often. We have heard a person observe that he hoed a small patch of corn in his garden every morning, Sundays excepted, from the time that it was an inch or two in height, till the top stalks or tassels made their appearance, or as the phrase is, the corn had "*tostled out*." The consequence was that the corn came forward with uncommon rapidity, and he had ears fit to roast more than a fortnight earlier than his neighbors, whose corn with equal advantages in other respects, was hoed but three times. Some people hoe their land very superficially, but they are but shallow cultivators. Dr. Deane observed that "the deeper land is hoed, the greater advantage do plants receive from hoeing, if due care be taken that their roots be not disturbed, or too much cut to pieces." Mr. Cobbett (under the head *cultivation*, American Gardener, par. 178. &c.) says, "If the subject be from seed, the first thing is to see that the plants stand at a proper distance from each other; because if left too close they cannot come to good. Let them also be thinned early; for, even while in seed-leaf, they injure each other. Carrots, parsnips, lettuces, every thing, ought to be thinned in the seed-leaf."

"Weeds never ought to be suffered to get to any size either in field or garden. In England

where it rains or drips sometimes for months together, it is impossible to prevent weeds from growing. But in this fine climate, under this blessed sun, who never absents himself more than about forty-eight hours at a time, and who will scorch a dandelion root or a dock root to death in a day, and lengthen a water-melon shoot twenty-four inches in as many hours: in this climate, scandalous indeed it is to see the garden or the field infested with weeds.

"But, besides the act of killing weeds, cultivation means moving the earth between the plants while growing. This assists them in their growth; it feeds them; it raises food for their roots to live upon. A mere flat-hoeing does nothing but keep down the weeds. The hoeing when the plants are become stout should be deep; and, in general, with a hoe that has spades, instead of a mere flat plate. In short, a sort of prong in the posture of a hoe.* And the spades of this prong-hoe may be longer or shorter, according to the nature of the crop. Deep hoeing is enough in some cases; but in others digging is necessary to produce a fine and full crop. If any body will have a piece of cabbages, and will dig between the rows of one half of them twice during their growth, and let the other half of the piece have nothing but a flat hoeing, that person will find that the half which has been digged between, will, when the crop is ripe, weigh nearly, if not quite, twice as much as the other half. But why need this be said in an Indian corn country, where it is so well known, that, without being ploughed between, the corn will produce next to nothing?"

"It may appear, that, to dig thus amongst growing plants is to cut off or tear off their roots, of which the ground is full. This is really the case, and this does great good, for the roots thus cut asunder, shoot again from the plant side, find new food, and send instantly, fresh vigor to the plant. The effect of this tillage is quite surprising. We are hardly aware of its power in producing vegetation; and we are still less aware of the distance to which the roots of plants extend in every direction."

We believe, however, that after plants have arrived at nearly their full size, it injures them to cut off their fibrous roots. While the plant is young and thrifty it may have the power to re-produce its roots if they are cut off, but not so when it has come near to maturity. Dr. Deane says "hoeing should cease, or be only superficial, when the roots are so far extended as to be much injured by hoeing. They will bear a little cutting without injury. For when a root is cut off several new branches will come in its place." Our farmers in general, and we believe correctly, decline to use the plough or horse hoe, among corn, after it has set for ears, as the phrase is, or in other words, the ears have begun to form; because, they say it injures the roots and prevents the ears from filling so well as they would do otherwise. But if weeds abound among the corn at the later periods of its growth, they should be pulled up by hand, destroyed by shallow hoeing, or it would be better than leaving them untouched, to clip them off with a scythe or sickle, that they may at least be prevented from running to seed.

* Hoes of a similar kind may be obtained at the Agricultural Establishment, No. 20, Merchants' Row, Boston.

One of the purposes to be effected by hoeing is to nourish the plants by drawing fresh soil near to them, and by the same means to cause them to stand more firmly. But this should be done with caution. Hilling excessively is hurtful, as it does not permit the roots to have so much benefit from the rains, and too much hinders the influence of the sun upon the lowermost roots. If, however, the ground be dry, and the season warm, it may be well to make the hills somewhat larger and higher than would otherwise be expedient.

It seems to be a point not yet fully settled whether it is best to cut off, or otherwise destroy the suckers of Indian corn. The Farmers' Assistant tells us that "the growth of suckers is injurious to the crop, and ought to be either pulled up, or bent down to the ground with earth sufficient to kill them; and this is believed to be the better way, as by this mean the principal stalk is not injured by wounding."—We believe in cultivating the premium crops in Massachusetts, the suckers were generally taken away. In the Hon. Mr. Hunnewell's account of his raising a crop of one hundred and eleven bushels of corn to an acre, (*Mass. Agricultural Journal*, vol. vi, p. 242) it is stated that "immediately after half hilling, the suckers were all carefully cut off." Col. Valentine's statement of having raised 116 bushels and 23 quarts of corn to an acre, (see page 178 of our paper,) mentions that "all the suckers were pulled out in July; and in August all the suckers were again taken away, together with the false stalks, and those that were smutty." Mr. Lemuel Davis, however, by an experiment, which is related in our first No. page 3, arrived at a different result. The gentleman last mentioned states that when he cut off the suckers from the stalks, he found "such a proportion of the juice wept out where the sucker was taken off that the growth was not so large, and the ear set higher upon the stalk; on the part where the suckers were not taken off, the corn was thicker set and more prominent—the ears set ten or twelve inches higher the ground, and were a good proportion larger." On the whole, we think that further experiments to ascertain the effects produced by removing the suckers are much to be desired; and we hope that farmers in general will pay so much attention to this subject as to take off or bury the suckers in at least one row of their field, and compare its product with the next in which the suckers are suffered to remain. The time and manner of performing this operation should also be carefully noted, and the whole made public for the benefit of the community.

The last number of the *Massachusetts Agricultural Journal* contains as much useful and interesting matter as any preceding No. of that valuable work. We propose, from time to time, to replenish our columns from that source, at the risk of incurring the displeasure of certain fault-finders, who object to every article which is not altogether original, or written expressly for the publication in which is made its primitive appearance. Although many of our readers have seen the articles which we have extracted, or may extract, from the work adverted to, yet many more residing in distant

quarters of the Union, may receive them thro' the medium of the *New England Farmer*, to whom otherwise they would be like a fountain sealed, or a light, which though brilliant, is without the limits of their horizon. It would be folly for us to deprive ourselves or our readers of the benefits resulting from a wholesome, invigorating, and fertilizing stream, merely because its fountain head is not situated on our premises. Besides, we are so well acquainted with the characters, views and motives of the gentlemen who conduct the *Massachusetts Agricultural Repository*, that we are confident they will not be displeased if we avail ourselves of the fruits of their labors, since we cannot in any other way so effectually promote the objects of their institution.

NEW AGRICULTURAL PUBLICATION.

By the politeness of JESSE BUEL, Esq. of Albany, we have received a copy of the second volume of "*Memoirs of the Board of Agriculture of the State of N. York. Published by authority.*" This work consists of more than 500 pages, octavo. It contains, we believe, quite as much valuable information, relating to the subjects which it professes to embrace, as any work of the kind ever issued from the American press. Indeed, nothing less could have been expected from the joint efforts of many of the most enlightened, liberal and philanthropic individuals in that large, populous and enterprising state, whose improvements in canals, steam-machinery, &c. &c. have realized what, half a century since, would have been thought to have been the dreams of a sanguine and visionary speculator.

In speaking of this work we shall not presume to take the chair of a critic, and shall in no other way express our high estimation of its contents than by giving, from time to time, such extracts as may in our opinion prove most beneficial to our readers. The following, from the preface, is all we have room for in the present number.

"The original articles in this volume give it a strong claim to public attention. But a few years have passed, since the business of cultivating the land, was generally considered here as a coarse occupation, giving a precarious living to the most laborious and the most numerous portion of the community. We now find active and intelligent men spread through the state, pursuing with spirit the improvements in agriculture, which a long experience has taught other countries, and devising practical and rational methods of accommodating them to our own climate and soils.

"To what is this important revolution owing? How is it that the farming interest has been so astonishingly redeemed from the unjust humiliation into which it had sunk?

"The answer is, that public patronage has elevated the condition of the yeomanry in their own estimation: it has given them confidence in their own resources, and in thus laying the best

foundation for individual and national contentment, has already produced its own reward. For certainly this great moral consequence far exceeds in importance, the comparatively insignificant means which have been applied to produce it."

[COMMUNICATED.]

We extract the following notice respecting Sheep, from the *Montrose Gazette*, published in Susquehanna County, (Penn.)—a county settled principally by farmers from the New England States, and which they have changed in twelve or fifteen years from a wilderness to a well-peopled farming district. The county has been described as high land, well watered, healthy, and particularly well adapted to grazing.

"My neighbor, Mr. Crandall, in the fall of 1818, had six ewes. In the spring of 1822 his little flock had increased to thirty-two, although in November 1819 he had killed two; in November 1820 he sold two and killed seven. In the summer of 1821 he sold seven, and in November following he sold seven and killed three. In November, 1820, he bought one ram, which with one of his ewes, died the following spring. He bought another ram in November 1821. Recapitulation—originally six; sold sixteen; killed twelve; bought two; lost two; remaining, thirty-two. The increase from the six, FIFTY-FOUR.

"J. Adams bought twelve ewes in September 1821, from which he raised sixteen lambs the following spring. The same year he sold from his flock ten, and killed six. From the remaining twelve he has this spring raised fourteen lambs. One of last years lambs, at one month and one day old, weighed forty-four and an half pounds.

"Mr. Follet has three ewes, each of which on the same night this spring, brought him three lambs, all of which are now living and thrifty." A FARMER.

To the Editor of the *New England Farmer*,

SIR—I am told the *Canada Thistle* is travelling East, and has already reached Vermont, New Hampshire and a part of Massachusetts. Indeed, I perceive it has found its way on to my own small farm, to my no little dismay.—Will you, Sir, permit me to ask my brother farmers to communicate to the public, through the medium of your paper, all they know about this plant; and particularly to state the best and most successful method to exterminate it. By so doing, they will much oblige

MIDDLESEX.

WHOOPIING COUGH.

A writer in the *Fredericktown Herald* gives the following as a remedy for this distressing complaint.

Dissolve 80 grains of salt of tartar in a pint of clear water, add to it 40 grains of cochineal, and sweeten it with loaf sugar. Give a child one year old, one tea spoonful four times a day, with a table spoonful of barley water immediately after. Boiled apples put into warm milk, may be the chief food, if they can be had. This will relieve the patient in two or three days, and cure in a week.

In the last stage of this complaint, take the tincture of bark 1½ oz. paregoric ½ oz. tincture of cantharides 1 drachm, mix them, and give to a child one year old 15 drops 3 times a day, and so on in proportion to the age of the patient.

FOREIGN.

Nothing new or interesting from the theatre of the French and Spanish war has transpired since our last. There has been a late arrival at N. York, Capt. Doane, from Cadix; but he brought intelligence from that city no later date than the 15th of May. Accounts from Andorra have been received by Capt. Tunison, as inserted in our last, to the 20th of May. We know nothing more of the alleged masterly manoeuvres of Gen. Mina, in thrusting himself between the French army and the frontiers of France; and we may as well pour our curiosity from day to day, till authentic accounts of a later date shall be received. We might give our readers a column or two of *guess work*, or present them with a few samples of the *buzz! buzz!* of English and American journalists, who make use of any inventions to keep curiosity awake and expectation on tiptoe, as well as make news from "the whole cloth," for the purpose of appearing to know what cannot be known.

From South America accounts are confused and contradictory, every new report showing the fallacy of that which immediately preceded it. The last intelligence in that quarter was received in New York, by Caracas papers, which came down to the 31st of May. They state that the Columbian squadron, consisting of vessels, has entered the Laguna of Maracaybo, under the command of Padilla; and that troops from Rio de la Hache arrived on the 19th in the line of Garatilla, and had there beaten 700 men belonging to Morales. Gen. Padilla has taken all the sea force of Morales in the Ragoon, and keeps him entirely surrounded, and has cut off all his resources. Morales cannot now escape, or rally any new force. He is carried out.

By an arrival at New York in 36 days from Pernambuco, information has been received that Lord Cochrane, with the Imperial Brazil fleet of 11 vessels, of which one is a line of battle ship, was blockading St. Salvador. Several thousand troops had recently arrived from Lisbon, to recover, if possible, and support the dominion of the mother country. St. Salvador is presented, however, as the only place in the possession of the royalists; and the patriots shut out the country to within a few miles of its gates.

DOMESTIC.

Robberies.—On the 26th inst. the store of Mr. Flavel, at the Head of Long Wharf, was entered, and a desk broken open, from which the robbers took a small sum in change. They also carried off a quantity of goods of different kinds. A reward of \$20 has been offered for apprehending the offenders.—On the same evening the printing office of Joseph W. Ingraham, in Franklin Avenue, was entered, and the counting room desks broken open. About \$40 was taken from one of the desks.—The next night, store No. 3, Long Wharf, was broken open, and goods to a considerable amount stolen therefrom.

Distressing Accident.—On the 18th ult. a quantity of gunpowder, in a waggon, was exploded in Dover, N.H. By this explosion two men were so badly burnt as to die within twenty-four hours. A third person was so much injured that it is feared, if his life is spared, his sight cannot be restored. The waggon had stopped in one of the most frequented parts of the village. Some powder from a cask had fallen on the ground near the waggon. To this some idle and mischievous boys set fire, in the absence of the owner. The fire communicated to the straw in the waggon. Alarm was given, and the inhabitants hastened to extinguish the blaze; but the owner, informing them that it contained 24 or 25 casks of gunpowder, checked their progress. The horses set out with the blazing waggon in the direction of the most frequented street, and the citizens turned them towards the river, which they nearly reached. Four or five persons, who had been informed of the contents of the waggon, attempting to unharness the horses, the powder took fire, and injured three of them as above mentioned. One of the horses was so much hurt that he died soon after, the other is rendered useless. The waggon was blown to atoms. The coat of the owner, which lay on the powder, was blown nearly across the river; and a saddle of one of the horses was blown into the air, and lodged on the roof of an adjacent house.

The persons burnt had sufficient presence of mind to plunge into the river. The explosion took place near a large brick store, which sustained the principal damage.

New Settlement.—Stephen Austin, a North American, has formed a settlement with three hundred families in Texas, and they have solicited the Mexican Congress to be naturalized as citizens of Mexico.

The Mississippi.—This river had fallen on the 8th ult. at New Orleans, about seven inches, but was still rising at the mouth of the Ohio, and the Upper Country was so inundated as to cause great destruction of the crops. For the distance of six or seven hundred miles up, nothing was to be seen but the tops of trees.

New Poem.—Solomon Southwick, Esq. Editor of the Albany Plough Boy, is about to publish a Poem, entitled "The Pleasures of Poverty."

More Saxon Sheep.—We learn that the Hon. Joseph Strong, of South Hadley, has recently received from Saxony, by way of Hamburg, two Saxon bucks and three ewes, in fine order. The spirit of enterprize and improvement manifested by Mr. Strong and by Messrs. Bates and Shepherd of this town, in introducing into the United States the fine woolled sheep of Saxony, is highly creditable to them, and will, we are persuaded, be productive of beneficial consequences to our country. *Northampton Gazette.*

A machine for making Pins is in operation at New York, belonging to Mr. H. Whittemore, which makes 30 pins in a minute.—In the British mode only 14 are made in the same time.

A new carriage has been invented in Philadelphia, which is propelled by the weight of persons who ride in it.

Notice is given in the Albany Daily Advertiser, for the benefit of all sturdy rogues and beggars, that a Stepping Mill is about to be erected in that city.

Internal Improvement.—The example set by the populous and powerful state of New York, has given an impulse to internal improvement throughout the United States, which deserves every encouragement. In Pennsylvania, Maryland, Virginia, North and South Carolina, and in Ohio, canals are in contemplation, and in a course of execution, which cannot fail to increase the wealth of those states, and add greatly to the general prosperity of the Union. The present moment is extremely favorable to these improvements. The monied capital withdrawn from trade, and which, to a vast amount, must be in the hands of individuals, may be advantageously vested in these undertakings; and, from recent examples in this respect, we are gratified to find there is no lack of means to effect the objects in view. The investment of funds in such a way will be profitable both to the present generation and to posterity.—*Washington Gazette.*

Important Discovery.—Some fine specimens of rich lead ore have lately been found near the surface of the earth, in a field belonging to Mr. Samuel Chase, in White Creek, in Washington county, Pa. More than a dozen hands were employed, for several days, in further investigating the extent of the mine.

The plant, vulgarly called *Pokeweed*, is recommended as a specific and sovereign remedy for the cancer. The recommendations appear to rest on a solitary experiment made by a person of color, who by accident threw the leaves of this plant over a cancer to keep off the flies. Finding unexpected relief, he repeated the operation, and was entirely cured.

The brine in which cucumbers are preserved, is discovered to be fatally poison to cattle and hogs. A gentleman in a neighboring town has lost several cattle and hogs in consequence of their drinking it.—*Rutland Her.*

The fly has ceased its ravages in some parts of Virginia, and the prospect respecting wheat is brightening. A good rye harvest has commenced—and corn looks well.

Dear Fruit.—In England, in April, a person gave two guineas for two cherries raised in a hot house.

The New York Canal Commissioners have at length decided that the Great Western Canal shall terminate at Black Rock, instead of Buffalo, as was at first contemplated.

Wm. M'Ree, late of the corps of Engineers; Lieut. Col. R. Lee, Superintendent of the National Armory at Springfield, Mass. and Capt. G. Talcott, of the Ordnance Department, have been appointed to explore the Western Country, under the act passed at the last session of Congress, for the establishment of a National Armory upon the Western waters.

Mistake corrected.—In our paper No. 47, p. 371, is a "receipt for destroying caterpillars," &c. in which it is directed to "take equal parts of turpentine and train oil," &c. as an application to destroy those insects. It should have been "take equal parts of spirits of turpentine," &c. This mistake is important, for the receipt, as it now stands, would probably prove ineffectual. The reader will please to correct it, by inserting *spirits of*, after the words "parts of," in the first line of the receipt.

DIED, on the 27th June, at his seat near Milford, His Excellency JOSEPH HASLET, Governor of the State of Delaware.

In Amherst, on Monday evening last, very suddenly, Rev. ZEPHANIAH SWIFT MOORE, D. D. President of the Amherst Collegiate Institution. His disease was an attack of the bilious cholera.

THE SPLENDORS OF THE SETTING SUN.

BY T. G. FESSENDEN.

Sol slowly sinking down the steep of heaven,
 With softened splendor greets the musing eye;
 Resigns his throne to "sober suited even,"
 But decorates, while he deserts, the sky.

His noon day beams, insufferably bright,
 Are now succeeded by a milder blaze,
 And every slanting filament of light
 Hear'n's kind and cheering effluence conveys.

Now let me wend my solitary way
 Where groves and lawns present alternate charms;
 Gaze on the glories of the waning day,
 Till night shall fold me in her dusky arms:

Mark how the clouds now seem like molten gold,
 And now like snow banks heap'd on banks of snow;
 Now dash'd with azure softer hues unfold,
 Now shift and kindle to a furnace-glow!

Compared with these, what is the pride of art?
 Your petty palaces, and pigmy spires—
 The paltry pageants of your noisy mart—
 And all the city-connoisseur admires?

Should the whole race of man unite as one,
 To celebrate some glorious festal day,
 The simple splendor of the setting sun,
 Would far transcend their most superb display.

From the London Museum for April.

MR. PERKINS' STEAM ENGINE.

We have no recollection of any invention connected with the useful arts having produced so great a sensation among scientific men, as the improved steam-engine of Mr. Perkins. It is not surprising that manufacturers, whose interests are entirely involved in the construction of engines on the lower-pressure system, should look with some degree of scepticism and jealousy towards the bold invention of Mr. P.; nor that they should raise doubts in the public mind as to the imminent danger to be apprehended from the use of high-pressure engines generally. But in the present case, many scientific men, totally unconnected with manufactures, seemed disinclined, in the first instance, to admit the possibility of the improvements suggested by Mr. P. being reduced to practice.

Notwithstanding the superior economy and increase of power in high-pressure engines of the usual construction has been gradually introducing them in various manufactories, where the proprietors take the precaution of employing *only* men of intelligence to superintend their concerns; the enormous increase of power ascribed to the engine of this gentleman's invention seemed perfectly *incredible*, until he produced conviction by the actual test of experiment. As we have had an opportunity of witnessing the operation of this beautiful invention, we shall give our readers as good an outline of its construction as we are enabled without the aid of a plate for reference.

Mr. P.'s invention is founded on a most invaluable discovery—that water is capable of enduring an elevation of temperature even to a red heat, or perhaps an indefinite extent, by being subjected to a very high degree of pressure; which pressure, while it permits the expansion of the molecules of the water as a *fluid*, prevents their further expansion, or the liquid assuming the *gaseous* form of steam.

The profound science and resolution, requisite to manage experiments of this dangerous

character, can only be appreciated by those who have devoted some attention to chemical subjects. This gentleman, however, has united to this discovery respecting the laws of expansion, the most simple and beautiful application of mechanical science, in the construction of his new steam-engine, which is briefly as follows:—Instead of the boiler of the ordinary engines, Mr. P. substitutes a cylinder, which he terms the *generator*. This cylinder is made of gun-metal, (the most tenacious and least liable to oxydation) of about three inches in thickness, closed at both ends, with the exception of a valve in the top, opening outwards; which valve is loaded with weights equal to the state of the pressure from the expansion of the heated water within. The cylinder is placed vertically in a cylindrical furnace; consequently it becomes surrounded on all sides with the fire, and soon acquires a temperature of 400 or 450 degrees Fahrenheit. The production of steam is effected by an injecting-pump throwing in water at one part of the generator, which displaces through the valve an equal volume of hot water from the generator. The water, at 420 degrees, passing into the induction or steam-pipe, instantly expands into steam, communicates with the working cylinder, and gives motion to its piston, which is placed in a horizontal direction, for the more convenient application of its powers to machinery. The reciprocal action of the piston opens and shuts the apertures of the *induction* and *eduction* pipes, by means of rotary valves, as usual in some other engines. But the operation of generating and condensing the steam is effected so instantaneously by this engine, that the piston performs about 200 strokes in a minute, when the engine is at full work. Indeed, considering the small extent of surface, the power of this engine is almost incredible, the generator containing only about eight gallons of water, and the working cylinder not exceeding two inches in diameter, with a stroke of the piston about 12 inches in length. The piston rod gives motion to a crank and fly-wheel similar to other engines.

A most decided improvement is also made by Mr. P. in condensing the steam under a very great degree of pressure, and at a temperature of about 320 degrees, and in this state returning into the reservoir for the successive supply of the generator. In consequence of this economical arrangement, the space occupied by the engine with all its appurtenances, does not exceed an area of six feet by eight. The present mode is calculated as equal to a 10-horse power; and Mr. P. considers the whole of the apparatus of sufficient size for a 30-horse engine, with the exception of the working cylinder and piston.—The consumption of coal for this engine is within two bushels per day, when at full work.

All risk of accident is effectually provided against, by the following ingenious contrivance. It should be remembered, that owing to the small extent of surface exposed to the expansive force of the steam, and the latter being generated *only* in sufficient quantity for each succeeding stroke of the piston, there is much less liability to accident from this engine than in most other high-pressure engines. To prevent, however, the possibility of such an event, the induction pipe, in which the steam is produced, is calculated to withstand an internal force of 4000 pounds to the square inch, and it

is also provided with a thin copper tube, which is calculated to burst at a pressure of 100 pounds; while the pressure under which Mr. P. works the engine, does not exceed 50 pounds on the square inch.

In order to demonstrate the perfect safety of the operation of this engine, notwithstanding this immense internal pressure, Mr. P. in his polite efforts to satisfy the scruples and fears of his numerous scientific friends, has, on several occasions, urged the power of the steam till burst open the sides of the copper tube without occasioning the smallest risk, either to the spectator, or to any other part of the apparatus. This mode of allowing the escape of the steam by rending open the sides of the ball, (which made of a determinate strength,) is probably superior in the certainty of its operation to any modification of safety valves.

It is also a very remarkable fact that the steam which escapes in this case is not by any means of that elevated temperature which might have been expected from its prodigious expansive force. This fact seems to involve some points connected with the doctrine of latent heat, or the conversion of fluid into gaseous matter, and *vice versa*, with which we are at present, but very imperfectly acquainted. We understand Mr. P. is further engaged in some very important enquiries on this most intricate branch of natural philosophy.

The improvements of Mr. P. in the steam engine, we cannot help considering as one of the greatest triumphs of art, even in this highly inventive age. It will, in all probability, effect a greater revolution in operative manufactures, than even the first introduction of the steam-engine by Bolton and Watt.

We have not heard any comparative estimate of the price of Mr. P.'s engines, but we apprehend their original cost will be very considerably lower than that of others; while they can be worked with 1-10th part of the fuel, and occupy only a fifth part of the space required for those of the low pressure construction. The latter point is one of the highest importance, in situations where manufacturers are limited for room, as in the metropolis and other great towns.

The very superior economy of these engines over all others, not only in the consumption of fuel and water, but in the weight of materials must also render them peculiarly adapted for loco-motive engines; and we entertain little doubt that steam carriages will, ere another year has elapsed, become as generally adopted among us as steam vessels are at the present. And when we take into consideration the immense saving in the consumption and tonnage of coals, we are of opinion that Mr. P.'s invention will infinitely extend the use of the steam engine in navigation.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but those who pay within *sixty days* from the time of subscription will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at discretion of the Publisher) until arrearages are paid. Complete files from the commencement of paper in August can be furnished.

Agents who procure new subscribers, and come responsible for the payment, will be entitled to a copy gratis, and in the same proportion for a larger number.

No. 50.

FACTS AND OBSERVATIONS RELATING TO AGRICULTURE & DOMESTIC ECONOMY.

BY THE EDITOR.

BEER MADE WITH HEMLOCK INSTEAD OF SPRUCE.

Judge Peters, of Pennsylvania, informs that "Beer quite as healthy, and much more agreeable than that brewed with the Canada or Halifax spruce, is made by the infusion of hemlock branches, with the materials of which our common spruce beer is composed. It has been substituted for spruce for many years in my family, and we think it preferable in flavor to the Canada or Halifax spruce."—*Memoirs of the Penn. Agricultural Society*, vol. i, p. 25.

BREAD, FOOD FOR HORSES.

Judge Peters asserts that "General Pulaski, a Polish officer who served in the U. S. army during our revolutionary war, had a favorite charger, to whom he often gave bread, which the animal seemed to enjoy beyond any other food. In Holland it is a common practice to give horses rye bread, or baked provender.—The late Sheriff Penrose, who had a fine team of working horses, was in the habit of buying condemned ship bread, as the most nutritious, and profited by its advantages."—*ibid.*, p. 236.

DUNG TOO MUCH ROTTED GOOD FOR NOTHING.

It was remarked by Judge Peters, that "during our revolutionary war, the late general P. Schuyler mentioned that he had once purchased a farm from the representatives of an old settler in the then colony of New York. A great incumbrance was, that some thousands of loads of dung had been accumulating for half an age; it having been considered as useless, when the land was fresh, and thrown into a vast ravine. At first the dung was operative, but the lower the mass was penetrated, the more worthless it became; till finally it would not compensate the labor and expense of hauling it out on the land."—*ibid.*, vol. ii, p. 291.

STONES USEFUL IN SOME SOILS.

Stones cannot be picked off too close from sandy or loamy soils; but a considerable quantity of small stones are very useful in clay-loam for preventing its becoming too compact.—*Memoirs of N. Y. Board of Agriculture*, vol. ii, p. 20.

DIFFERENT MODES OF PLOUGHING DIFFERENT SOILS.

Loamy soils can never be ploughed too deep, nor mellowed too much; but sandy and clay soils should merely be turned over, in a flat furrow, and not afterwards ploughed so deep as to break the turf. For clay if mellowed too much will become mortar in wet weather, and bake in dry, and the sand will become too loose to support vegetation.—*ibid.*

The mode of ploughing sandy soils, according to the system adopted by the celebrated Duckett, an English farmer. "It was founded on three principles: 1. Ploughing very deep—a due degree of moisture was thus preserved in his light land, by means of which his crops were flourishing in seasons of drought, which destroyed those of his neighbors. 2. Ploughing

seldom, but effectually, by a trench plough, or what he called a skim-coulter plough, with which he buried the weeds that grew on the surface; he has been known to put in seven crops with only four ploughings; and 3. Occasionally raising a crop of turnips the same season, after a crop of wheat or of pulse."—*Code of Agriculture*, p. 15.

It is remarked by an eminent author, that if one ploughing to the full depth be given, once in 12, 18 or 24 months, shallow tillage afterwards, is, in many cases, preferable to frequent deep working, and especially for wheat, which loves a firm texture."* "This doctrine is well entitled to the attention of the practical farmer."—*ibid.*, p. 302.

Although some soils of a very loose texture may be ploughed or pulverized with harrows to an extreme, we believe this offence against good husbandry is very rarely committed. But that a loose soil may be and sometimes has been ploughed and harrowed to excess there is but little doubt. Wherever there is a want of coherence in the particles of the soil, too frequent ploughing, harrowing, &c. exposes the best part of it to be blown away by wind, or washed off by rain. When the soil has too little cohesion, or is easily made "mellow as an ash heap," as the phrase is, it should be disturbed no more than is necessary to keep it clear of weeds, and place the seed in the ground. What ploughing and harrowing is found to be indispensable, in such a soil, had perhaps better be performed in the spring than in autumn; for if the texture of the soil is naturally too loose, and it be ploughed in the fall, the frosts of the winter succeeding will greatly increase the evil.

Dr. John H. Steel, of the county of Saratoga, state of New York, in "Notes to the Geological Survey of Saratoga County," published in "*Memoirs of the Board of Agriculture of the State of New York*," page 155, observes that "The idea of rendering the earth mellow for the reception of the seed, which means, to have it finely pulverised and light, in common language like an ash heap, does not appear to be so important as many of our farmers seem to imagine. The great object of ploughing is to destroy and cover in the earth every species of vegetation, that the crop to be expected from the seeding may have nothing to choke and impede its growth, or deprive it of any share of the nutriment that there is in the soil, which would be useful to its own health and vigor; when this object is effected, the plough can be of no further use, except to cover the seed.

"The prevalent opinion, that turning in the dew, or exposing a new surface of the earth frequently to the rays of the sun, enriches the soil, has likewise no foundation in fact. The earth can imbibe nothing from the sun's rays but heat and light, which it possesses in sufficient quantity for all the purposes of vegetation, when it has not been moved at all. Who has not observed the most luxuriant spontaneous productions, where the soil had not been stirred for years? And it is a maxim among farmers, that

* Young's Calendar, p. 510.

"where weeds grow luxuriantly, every other vegetable will." Indeed, the frequent exposure of a new surface of the soil, during the summer months, must expose the volatile principles which it may contain to exhalation, and thereby endanger the loss of one essential article to its fertility, which in soils that contain much animal matter is very considerable. The turning in of the dew is equally absurd; it can contain no ingredient that is not found in rain water, which is nearly pure. The dew is simply the exhalations of the day, which are condensed during the cool of the evening; like rain, it forms an essential moisture for the support of vegetation, but can have no other effect."

The same writer observes (page 157, of the same work) "That frequent ploughing is useless, and frequently injurious, may be further inferred from the experience of many of the most observing farmers. The practice of merely turning over the sod and sowing on the furrows is becoming every year more popular, and an intelligent farmer has just given me the following account of a process which he tried the season past.

"Having a clean clover field, which he intended to plant with Indian corn, a part of it was ploughed and planted in the usual way, while the space between was left unmoved and greased with clover, to be turned over to the hills during the process of hoeing; the corn was planted on the centre of the ridge. The success of this process was very observable through the season; the corn had a much more rapid and luxuriant growth, and at harvest yielded a considerable more abundant crop than the other parts of the field.

"The result is imputed by my informant, to the following causes: 1st. The ground beneath the hills of corn remaining unmoved and covered by the furrows, retained the moisture longer than that which had been turned over and exposed to the air and sun; hence the plants did not suffer by the drought, as did those in other parts of the field. And, 2dly. The turning of the sod, which was permitted to grow between the rows, up to the hills at hoeing time, furnished the roots, as they extended from the ridge, with a new supply of vegetable matter and moisture."

Other writers, however, among whom may be mentioned Mr. Curwen, a very celebrated English cultivator, assert that frequent ploughing and hoeing promotes moisture, and stirring the soil is the best of all remedies against drought. Mr. Curwen holds that by constantly turning the vacancies between the rows or beds, in every direction, he can in dry weather procure for the plants something like a compensation for rain, in the evaporation of moisture from the earth. The first day's exhalation from ploughing is in the proportion of 950 lbs. of water per hour from an acre. The evaporation decreases on the second day a third part, and continues to diminish for three or four days according to the heat of the weather, when it entirely ceases; and is again renewed by fresh ploughing. A field of cabbages were this year set on very strong stiff clay, which previous to

their being planted was in high tilth. The severe drought which succeeded the rains that fell soon after the setting, *baked the ground perfectly hard*. The plants made little or no progress; they were seen by a friend of mine, on Monday, the 26th of May, as I was commencing the breaking of the ground with the ploughs. They were worked for the whole week. On Saturday they were seen again by the same gentleman, and he could scarcely be persuaded they were the same plants. The week had been very dry, with a hot sun, and strong north east winds." Mr. Curwen attributes the rapid growth of his cabbages after the hoeing above mentioned to the absorption of the evaporation produced from the earth. According to him the earth beneath the surface, which was stirred by the plough, furnished the water of evaporation, which the soil thus stirred imbibed like a sponge or fleece of wool, and retained for the use of the plants. Dr. Steele, however, as well as some other writers, is of opinion that frequent ploughing, in a dry time, makes the soil drier than it would be if left at rest. The only way to reconcile these writers is to suppose that they are treating of totally different soils. A sandy soil, or a loam much inclined to sand, can scarcely be ploughed too seldom, provided you can keep weeds subdued, and the seed is properly covered. A clayey soil, or a loam much inclining to clay, can scarcely be ploughed too often, provided it is not too wet when you plough it. The sandy soil is like a riddle, and permits the water of evaporation as well as that of rain or dew to pass off too rapidly. By stirring it frequently you render its texture still looser, and increase its tendency to transmit instead of imbibing and retaining moisture which it receives from the earth or the atmosphere. A clayey soil, when well pulverized, is like a sponge, which imbibes moisture freely, and does not easily part with it. But if it once becomes dry and *baked* in the sun, it will require frequent and effectual ploughing to render it at all fit for the purposes of vegetation. A clayey soil should be ploughed in autumn, that the frost of winter may assist in pulverizing it. A sandy soil should be ploughed in the spring, as near the time of putting the seed into the ground as possible. A sandy soil should not be ploughed or hoed in dry hot weather; but a clayey soil cannot be stirred too frequently in such weather.

[BY THE EDITOR.]

NEW AND INTERESTING PAMPHLET.

A pamphlet has recently been published in this city, entitled, "*Remarks on the dangers and duties of Sepulture; or, security for the living, with respect and repose for the dead.*" By a Fellow of the Massachusetts Medical Society. *Non defunctorum causa, sed vivorum incerta est sepultura.*—Seneca.* This production, in our opinion, does the highest honor as well to the head as the heart of its author, and ought not only to be found in the library of every man of science, but to be in possession of every house-keeper and head of a family. It is an 8 vo. pamphlet, containing more than 70 pages, and still has nothing superfluous, nothing which can fail to

* Burials were instituted, not for the sake of the dead, but for the benefit of the living.

be read with interest by every man who claims affinity to his species, and considers health or even life itself as blessings worthy of his attention.

We have long been deeply impressed with the importance of the subject of this pamphlet, and have heretofore exerted what little influence our limited talents, leisure and means of information might possibly give us, in warning against the danger of converting our cities into cemeteries, and suffering them to become repositories of animal and vegetable putrescence, which not only offends the senses, but more frequently than is generally imagined, poisons enjoyment, ruins health and destroys life. But, till we read the pamphlet we now allude to, we had no adequate idea of the very malignant nature of the evils we deprecated, nor the power and universality of those sources of disease and pestilence which are so ably developed in this publication.

We do not intend this article for a review of the work to which we would be happy to call the attention of the public, but merely such a notice as would be likely to induce our readers to become the possessors of the information it contains, and which will be best obtained from the pamphlet itself. It would not be in our power to add any thing important to its contents, and should we attempt to give condensed views of the same subjects, we must of necessity omit what it is important should be generally known. We shall therefore give no farther specimens of the contents of the work, than what we judge may create an inducement to possess the *original* from which we have taken our samples.

Under the head "*Sepulture*," the author treats "of the various modes of burial, which have prevailed in the world," including the origin of the custom of depositing the dead in cities, under or near churches, &c. The author then inquires, "*What proof is there that putrid flesh ever did any harm?*" Under this head he gives a number of statements, drawn from undoubted authorities, of the *very virulent nature* of the effluvia arising from animal putrefaction under certain circumstances. The instances he quotes are numerous, some of which will apply as well to residents in the country, as to inhabitants of cities. Among those of the latter description are the following:

"Lancisi writes that a putrid ox occasioned the death of an unfortunate traveller in Pisaro.

"Lucian speaks of a wide spreading disease, which ravaged Pompey's army, near Durazzo, which originated from the putrefaction of horses that had been killed and left uncovered.

"M. Bernard relates the following fact. A large fat man had been superficially buried in the ground. The offensive gases, which soon arose from the putrid body, obliged the neighboring inhabitants to remove it. Three grave diggers undertook to remove it; two of them becoming sick at heart, and vomiting, gave up

the enterprise; the third—determined to finish it—persevered, fell sick, and died ten days after.

"In West Linton, some years ago, a school boy, getting into a new made grave, set about to open the projecting corner of a coffin, which, so soon as he had penetrated, there issued a strong nauseous smell, on which he exclaimed that he was suffocated; he revived on being taken out of the place, but fell immediately ill of a petechial fever, of which he died on the seventh day.

"M. Chambon reports, on the testimony of several historians, and on the faith of President De Thou, that the Peruvians, animated by a just vengeance against the Spaniards, steeped their arrows in the putrid blood of their slaughtered companions, to make the wounds they inflicted the more surely and promptly mortal.—M. Huzard says that a number of students in the French veterinary schools have suffered in like manner, in consequence of being wounded while dissecting horses and other animals.

"The decomposition of a body in the bowels of the earth can never be dangerous, provided it be buried at a sufficient depth, in a proper place, and the grave be not opened before its entire decomposition. The depth of a grave ought to be such that the external air cannot penetrate it; and that the exhalations which are developed should not be capable of forcing the earthy covering which detains them.

"Some years ago a man was killed by accident in Orange, New Hampshire. In about ten weeks after the burial the body was taken up to be deposited in a different place. Twenty persons were present at the disinterment of the corpse, which was in a putrid state. Thirteen of these persons fell sick of fever not long after their exposure to the putrid gases from the dead body, and several of them died. There was no other assignable cause for this fever than those noxious gases, the season and the place being otherwise quite healthy."

The author proceeds to cite a great number of other instances of the deleterious and often deadly effects which have originated from tombs and burial places improperly situated, and from imprudent exposures to the effluvia arising from vegetable and animal decomposition. He then quotes from the writings of the Rev. Dr. Dwight, a description of the cemetery at New Haven, which "may serve as a model to be improved by any amendments which genius or experience can suggest." Among other advantages arising from this cemetery, as enumerated by Dr. D. are the following:

"An exquisite taste for propriety is discovered in every thing belonging to it; exhibiting a regard for the dead, reverential but not ostentatious, and happily fitted to influence the views and feelings of succeeding generations. At the same time, it precludes the use of vaults, by taking away every inducement to build them.

"These melancholy, and I think I may say disgusting mansions, seem not to have been dictated by nature; and are certainly not approved by good sense. Their salubrity is questionable; and the impression left by them on the mind transcends the bounds of mourning and sorrow, and borders at least on loathing."

This pamphlet can admit of no answer—it is

impossible to gainsay or refute its positions because they are founded on facts which are neither few in number, doubtful as respects their evidence, nor equivocal as regards the lessons which they inculcate. To contend, after this, that deadly diseases are not communicated by effluvia arising from dead bodies, or other sources of animal putrefaction, must be deemed as absurd as to say that neither heat nor light emanates from the sun, or that darkness never succeeds to the close of the day.

We shall finish this notice with one other quotation from the conclusion of the work, which must recommend it more effectually to our readers than any observations of our own, though expressed in terms of eulogy commensurate with the merits and importance of the production.

"The author has no theory to propose but that of truth; no cause to plead but that of human life with its blessings and enjoyments. He wants no temple in order to find a grave. If he can but deserve the epitaph of SIMON PETER,* he will be content to be buried alone, or by the side of others,—like Aristides, in a field; like Homer, on the border of the sea; like Lysander, on a plain; or like any body else, who has been buried without parade, and without a tomb, at such a distance from his survivors as not to contaminate the air they might breathe, or the water they might use. He will be satisfied with any plan which shall give SECURITY TO THE LIVING, WITH RESPECT AND REPOSE FOR THE DEAD."

*Simon Pierre, vir, pius et probus,
Hic sub dlo sepeliri voluit,
Ne mortuus cuquam noceret,
Qui vivus omnibus proferat.

An American Translation, or Paraphrase.

Here lies,
Under the pure and breezy skies,
The dust
Of Simon Peter, the devout, the just,
Doctor of Medicine.—
At his request
He sleeps in earth's sweet wholesome breast,
Rather than in a noisome cemetery,
Under a church where all the great they bury.
'Twould be, he said, a sin
Past all enduring—
A sin which to commit he was unwilling,—
Should he, who, while alive, got fame and bread,
The sick by curing,
Entirely change his hand, and go, when dead,
The well to killing.

From the American Farmer.

Boston, June 3, 1823.

CULTURE OF THE HOP.

MY DEAR SIR—I have to apologize to you, for my negligence, in delaying so long to reply to your inquiries respecting the culture of hops. The method which I have practised, has been to prepare the ground in the same manner as is common for raising Indian corn; after ploughing it well, to harrow it, and then furrow it cross ways, so as to leave the hills eight feet apart—then to manure in the hill with quite as much as you would do for corn. In the spring, cut your slips from the root of the hop vine, about nine inches long, and lay them upon the manure, three or four in a hill, and cover them with earth about as deep as is usual to cover corn—thus the planting, &c. is complete. You

may for the first year, plant corn or potatoes between the hills, if you please; but I think it better economy not to do it, because you may plough with oxen between the rows, to lighten the ground preparatory for hoeing, which ought to be done three times during the summer. You get no produce the first year, and therefore it is unnecessary to pole them, unless perfectly convenient.

In the spring of the second year, you place, to each hill, two poles of about thirteen to fifteen feet above ground; and as the vine grows you train it to the poles. It is best to hoe them three times in the season, and (unless your land is very rich) it will be well to add some manure at the first hoeing. In gathering in the produce, you cut the vine to the ground, and pull up the poles, lay them across large wooden bins or boxes, made of rough boards, about ten feet long and five or six feet wide, into which the hops may be stripped off. This work may be performed by women and children. You take them from these boxes in bags, and carry them to the drying kiln, which is generally placed at the side of a hill or rising ground, for the convenience of taking the hops in upon the cloth or netting, which is stretched upon the sills above the furnace, which is at the bottom, where the fire is made, which ought to be with charcoal, because it gives the hops a much better flavor than by curing them with a fire made of wood. It is necessary that some careful person should attend, constantly stirring the hops with a rake during the process of curing, so that they may be well dried, without discoloring them. After you take them from the kiln, they must be spread (under cover) in an airy room, and constantly moved with a rake, once or twice a day, for ten or twelve days, when you may bag them for market.

This hasty, imperfect sketch, is from my own experience only. I presume you may obtain better information from those who have been longer in the habit of cultivating this vine.

I am, with great respect,

Your friend, and ob't servant,

ISRAEL THORNDIKE.

GORHAM PARSONS, Esq.

From the Connecticut Journal.

TO FARMERS.

The season promises a very great crop of grass, with a more than usual proportion of white clover, which flowers abundantly. It is very desirable that the farmers in New England should use the opportunity which is near at hand, of securing a good supply of the seed of this very valuable grass, which for many purposes excels all the other grasses.

Pasture grounds well stocked with white clover yield more nutriment for cattle and sheep per acre than any other, and cows fed on white clover give milk of a superior quality. Besides affording the best pasturage in the world, the white clover may be cultivated to advantage for hay. White clover and herds'-grass sown on rich land, make a thick bottom, and the crop of hay will be more valuable than the crop from the same land sown with red clover and herds'-grass.

Besides the advantages above mentioned to be derived from the culture of white clover, it has another excellence of no small importance to the farmer. The sward or turf formed by

white clover is always tender and easily ploughed or broken up, and all kinds of grain and corn flourish wonderfully well after this grass.

As white clover is what some would call natural to this country, that is, as it will after a few years get into land used for pasturing, the farmers have generally suffered it to grow, but have not saved the seed. This is a very great error. When land is laid down for pasturing and sowed with other grass, it generally happens that the grass-seed does not spring well, and the weeds spring up and occupy the ground a year or two before it is covered with white clover, whereas if the seed is sown, it will produce twice the quantity of seed. The best time for sowing white clover is in the fall with winter grain, but it will do well sown in the spring, and if by reason of drought it does not spring the first season, it will the next, as the seed is of a very imperishable nature.

The seed is collected by an instrument in form of a rake, with long sharp teeth set so near together as to let the flower stalks of the clover slip in between them, but not to allow the heads to pass. These will be broken off and collected on the upper side of the rake, and may be removed from time to time as the rake gets full. When the heads are collected they should be put into a dry place, and when thoroughly dried they may be threshed on a clean dry floor, and the chaff winnowed out.

The seed when clean is worth half a dollar a quart, or \$16 a bushel. The instrument for collecting will cost but little, and children can do the work, which may be done to very great profit.

From the New York Mercantile Advertiser.

FRUIT AND VEGETABLES.

Messrs. Editors—I have been very much troubled the present dry season with small insects and flies on my gooseberry, currant, and rose bushes, and on my cabbages and cucumbers—but I have now the satisfaction to inform you that there is no such thing in my garden, and I am indebted to an intelligent neighbor for a cheap and easy mode of destroying them. He informs me that he had made use of a cheap and simple remedy, and which had never failed—and which was to sprinkle his bushes and vines with soap suds night and morning for a few times, and the fly and insect had never failed to disappear. I have made use of this recipe, and the effect has fully equalled my expectation—and I am of opinion if applied to fruit trees, the effect would be equally favorable. It belongs to the public to be made acquainted with this simple expedient to remove so great an evil—and I shall, therefore, be obliged to you if this small communication can have an insertion in your paper. G. C.

(C) For some remarks on the use of soap suds for manure, as well as an antidote against the ravages of insects, see New England Farmer, page 332.

CURE FOR THE ASTHMA.

Cut six penny worth of camphor into pieces the size of a small pill, and put them into a phial, for the convenience of the pocket, and whenever (night or day,) the spasmodic cough or nervous breathing commences, chew and swallow one or more of these pieces, as the case requires. The experiment may be worth a trial.—London paper.

From the Manufacturers' and Farmers' Journal.

WOOL.

I observed in a late number of the Journal,* an extract from a southern paper, purporting to be a communication from a farmer near Alexandria, requesting information upon the subject of the difference of the price of wool in Alexandria and Boston. The Alexandria farmer deems it a mystery that imported wool should command in Boston, seventy-five cents to one dollar twenty-five cents per pound, while he is selling the produce of his flocks at forty cents the pound, and proposes that the growers of wool should hold free communication with each other in order to maintain their prices. The difference is ascribed by the writer with much illiberality and injustice to a "mere eastern trick," to defraud the agriculturists of the south of the fair value of their fleeces. He considers "that since Congress has given encouragement to our manufactures, an equal encouragement should be extended to those who raise the wool, which is the raw material."

It is of much importance that prejudices and erroneous impressions should be dissipated, particularly when they affect the local feelings of different sections of our country. The growers of wool as well as the manufacturers of that article should have a proper understanding of their mutual interests, without harboring unkindly suspicions of each other. The Alexandria farmer observes with much justice that "wool is becoming too important an article not to be entitled to some attention."

Agreeably to the request contained in his communication, I shall endeavor to explain the cause of the difference in the price of foreign and domestic wool as sold in this country.

This difference is owing partly to the relative fineness of foreign wool, and partly to the superior manner in which it is put up for the market. The imported wool is usually assorted into three or more different grades, with appropriate marks to designate the bales containing each grade. This wool is thoroughly washed in a weak lye, to scour from it the yolk or grease peculiar to wool in its native state. By this process it loses from 25 to 60 per cent. of its weight in the rough state, and of course sells for an enhanced price after the operation. The farmers of the United States are satisfied with merely washing their sheep in the river previously to shearing them. This operation commonly scours off but an inconsiderable proportion of the grease, when performed with the utmost care. When the sheep are washed, as they usually are, in a careless and transient manner, and are afterwards left to run several days before they are sheared, their fleeces are often saturated with oil to the amount of one half of their weight. It is probably owing to this circumstance that the Alexandria farmer complains that he obtains less for his wool, of equal fineness, than is paid elsewhere for foreign wool well cleansed. The account would stand thus:

Cost of unwashed wool at 10 cents per lb.—10 lbs. is \$1. Loss by washing, say 50 per cent.—5 lbs. Remaining of washed wool 5 lbs. cost \$4, or 80 cents per lb.

As it regards the encouragement afforded to our woollen manufactures by Congress, the Alexandria farmer seems to labour under a mis-

take. No particular act has been passed by Congress with the express view of protecting the woollen manufactures, but only for the purpose of revenue. They are left to struggle against the overwhelming capitals of English manufacturers, and to sustain themselves as well as they can under the discouraging effect of excessive foreign importation. Few persons are aware of the vast sums annually remitted from this country, merely for the articles of cloth and cassimeres. By the last return of the Secretary of the Treasury for the year ending on the 30th of September, 1822, the imported cloths and cassimeres amounted in value to eight millions four hundred and ninety-one thousand dollars—being more than a tenth part of all the importations of the country. The numerous manufacturers in different parts of the U. States, furnish a great additional supply of cloths, which are now often preferred at the same prices to foreign cloths. It behoves many of those who are the most violent in their prejudice against the skill and workmanship of their fellow countrymen, to look well to their tailor for the origin of the coats they wear. These woollen manufactories have in many places ceased operating on account of the depressed state of the business. Any proposition therefore that may tend to raise the price of the raw material they manufacture, without at the same time advancing the price of their goods, must tend still more to discourage and to crush them. The value of imported wool during the year ending on the 30th of September last, amounted to three hundred and eighty-seven thousand dollars. There can be but little doubt that some protective measures will be adopted by the next session of Congress in favor of this description of manufacture, which is so necessary to the welfare of the nation, should foreign resources be suddenly cut off by wars or other causes, and which might afford a most extensive and profitable employment to the agricultural interest. As a branch of national industry, it has been emphatically termed "the wealth of England." It is particularly indispensable to the wants of a climate like ours, whose wintry blasts are so piercing, and whose summer heats are so often succeeded by sudden and unhealthy changes to chilling winds and storms. A.

Newburyport, Mass. May 20, 1823.

J. S. SKISNER, Esq.—"A lover of honey," in your paper, No. 9, vol. 5, says "there is a gentleman in the lower part of your native county, who knows much better how to take honey from bees than the German mentioned in your paper, No. 48, vol. 4, and with less expense than Blake's potent hives;" and goes on to state the process of taking off the top of the hive, &c. I confess I am not authorized to answer for your numerous patrons, but have the sanity to think a majority would prefer a hive like Mr. Blake's, that the top could be lifted like a chest cover, and the honey taken in a draw or box, that would be no disgrace to any table, if placed on it, to the method of knocking off the top of a hive, and breaking up a quantity of comb, as it must necessarily be broken; to say nothing of dropping the honey, and leaving the hive in a state of ruin, that would take the industrious little animals a long time to repair—even if the

extra expense of the hive was 50 cents—as it cannot exceed that, unless you have a lock, (which is an improvement) and would probably add 25 cents more. If your correspondent has recommended a better way, of course it will be adopted; on the other hand, if Blake's hive is not considered too expensive, this notice may help him to sell a right. B. P.

From the National Intelligencer.

COMPOSITION TO PRESERVE WOOD.

MR. GALES—It becomes important to have a simple composition, in the application of which, the durability of bridges constructed of wood will be extended for a long period of time without a roof; whereas, if left exposed to the weather, ten years is their estimated limit of duration. It well deserves the attention of the directors of the city bridge company, for, as the timbers are new, well seasoned, and have suffered no apparent decay, the mixture being now put on will be in time to prevent the operation of the rot.

I send you two receipts, one for the preservation of wood or timbers liable to be injured by the weather; and one for the roof of a house, to defend it not only from the weather, but also from fire, and I doubt not they will be both acceptable to many of your subscribers, among whom I am

ONE.

Composition for preserving weather-boarding, and all other work liable to be injured by the weather.

Lime, it is well known, however well burnt, will soon become slacked by exposure in the open air, or even when confined in a situation, if not remarkably dry, so as to crumble of itself into powder. This is what is called air-slacked lime, in contradistinction to that which is slacked in the usual way, by being mixed with water. For the purpose of making the present useful composition to preserve all sorts of wood works exposed to the vicissitudes of weather, take three parts of this air-slacked lime, two of wood ashes, and one of fine sand, pass them through a fine sieve, and add as much linseed oil to the composition as will bring it into a proper consistence of working with a painter's brush. As particular care must be taken to mix it carefully, it should be ground on a stone slab with a proper muller, in the same manner as painters grind their white lead, &c. But where these conveniences are not at hand, the ingredients may be mixed in a large pan and well beat up with a wooden spatula. Two coats of this composition being necessary, the first may be rather thin, but the second should be as thick as it can conveniently be worked.

This most excellent composition for preserving wood when exposed to the injuries of the weather, is highly preferable to the customary mode of laying on tar and ochre. It is indeed every way better calculated for the purpose; being totally impenetrable by water, and so far from being liable to injury by the action of the weather, or heat of the sun, that the latter, though such a powerful enemy to tarred and oiled palings, &c. even hardens and consequently increases the durability of the present proposed composition.

Another receipt for the roof of a house, to defend it from the weather and from fire.

Take one measure of fine sand, two measures of wood ashes well sifted, three of slacked lime

ound up with oil, laid on with a painter's brush, first coat thin, and second thick.

I painted on a board with this mixture, and it adheres so strongly to the board, that it resists an iron tool, and put thick on a shingle resists the operation of fire. I used only a part of the mixture; what remains, continues in an iron pot; water has lain on the mixture for some time without penetrating the substance, which as hard as a stone.

The Boston Journal of Philosophy and the Arts.

The following notice of this new publication, extracted from an article in the Massachusetts Agricultural Repository and Journal, No 4. Vol. 1, signed J. L.—one of the editors.

"Not in any degree interfering with that of Professor Silliman, the Journal in question is intended to introduce to the American public, those articles in foreign publications devoted to Philosophy and the Arts, which may be thought most useful. We meet this stranger with the most hearty and cordial welcome. Every one who reads much, knows that it is impossible in the present state of our country, that the European scientific journals can all of them, or indeed any of them, be republished here. They cannot be imported without enormous expense, owing to the inexplicable policy of laying heavy duties on all works, without discriminating those which must have a limited circulation, from those which are read by the great mass. This work is intended to give us a selection from the European publications, of those articles which are peculiarly interesting to us and adapted to our condition and progress. The Journal is under the management of Dr. J. W. Webster, Dr. J. Ware, and Mr. D. Treadwell, and we cannot have a better pledge of the sound discretion which will be exercised in the selection, than the well merited reputation of its joint editors. We most earnestly hope it will receive that encouragement which the very attempt deserves, and which is due to the spirited efforts of these scholars, and without which, no scientific exertions can be long successful."

NEW ENGLAND FARMER.

SATURDAY, JULY 12, 1823.

Farmer's and Gardener's Remembrancer.

JULY.

INDIAN CORN.—Some farmers delay their hilling till haying, in order to husband time, calculating to hill their corn when the weather is such that haying cannot be attended to with profit. This, however, is not altogether a correct mode of proceeding, for the following among other reasons. 1st. Your corn suffers by this delay, and ten to one the weeds get such a start that your labor is much increased, and its good effects greatly diminished. 2dly. By delaying your third hoeing, or hilling too long, your hilling, haying and harvesting press on you all at a time, and you do nothing well, because you do every thing in a hurry. 3dly. When hilling is delayed till haying, you generally hoe your corn in wet weather, because such weather is unfit for haying. But if the soil is considerably wet, ploughing or hoeing it does but little good, and sometimes causes more harm than benefit. The weeds are not destroyed, the land is left in a heavy state, and so tight

that the roots of the corn cannot penetrate it, and spread as they otherwise would. You therefore need fine weather for hoeing as well as for haying. A little dampness, however, will be less injurious in the former than in the latter kind of business; and of course it may sometimes be proper to leave your hay-field for your corn-field. But if the ground is considerably wet, or there is a prospect of a "wet spell," you had better go with your boys, and the rest of your "help" to cutting bushes. Dr. Deane said, "other circumstances being equal, the wettest weather is best for destroying shrubs by cutting; because the sap vessels of the stumps will continue open the longer; there will be the greater discharge of sap through them, and the roots will be the more weakened."

"Bushes, which grow in clusters, as alder, and some other sorts, may be expeditiously pulled up by oxen; and this is an effectual way to subdue them. The expense of it, I suppose, will not be more than that of cutting them twice would amount to." The wetter the ground is the more easy it will be to pull up bushes.—But if you have no bushes which require cutting, and the weather is too wet for haying or hoeing, you may find a profitable amusement in

DIGGING AND DRAWING STONES, AND MAKING STONE WALL.—Stones can be dug out of the ground much easier when the ground is wet, than when dry. And now, before we forget it, we will state what the Farmers' Assistant says are the best modes of making stone walls.—"Dig a trench where the wall is to be made, to the depth of about eighteen inches; into this throw all the small and bad shaped stones, until the trench is filled; then on the top of these build the wall, in a mason-like manner, to the height of about five feet, and throw the earth dug out of the trench up against the wall on each side; and in this way it will stand for a length of time beyond the memory of man. If a trench be not dug in this manner, the next best method is to plough deep trenches close on each side of the wall, after it is built, and throw the earth thus ploughed up against the wall."

TURNIPS.—It is about time to think of raising turnips for feeding stock and other winter uses. They require a light sandy loam, made pretty rich and mellow. The seed may be sowed about the middle of July, but it is not necessary to be very precise as to the time. Dr. Deane observed that he had sown them the first week in August, and had a good crop. If sown so late, they generally escape insects, and though they may not grow quite so large, they will, commonly, be better for the table than those which are sowed earlier. They may be sowed broad cast, or in drills; and if the former way is chosen one pound of seed is the common allowance for an acre of land; but if the fly is to be provided for, the quantity of seed should be a little increased. The Farmers' Manual says, "To secure your turnip crop decidedly against the fly, steep your seed 12 or 24 hours before sowing, in fish or train oil; drain off the oil from the seed, and roll the seed in plaister; this will separate the seed from the glutinous adhesion of the oil, render the casts pure, and enrich your crop." It may be tried, but we doubt its efficacy. The cause does not seem to be adequate to produce the alleged effect; for the minute quantity of oil which might be attached to

or imbibed by so small an object as a turnip seed, could hardly, we believe, communicate any odor or flavor to a plant sprung from such seed, sufficient to preserve it from insects. But if fact says otherwise, philosophy may as well be silent. Experiments repeatedly made, and accurately noted, must, after all, be considered as the only sure basis of improvement.*

The seed, when sown broad cast, should be harrowed in with a short tined harrow, and it will be of service to roll the ground with a pretty heavy roller, to prevent the soil from being too loose, break the clods, and level the surface. It is said that top dressing of ashes, or soot strewed over the ground is a good preventive against the fly, and other insects, and it will at least quicken the growth of the plants, and the faster they grow the sooner they will be out of danger from the fly. Infusions of elder, wormwood and tobacco, sprinkled over the ground as soon as the plants appear, have likewise been recommended, but perhaps would be thought too troublesome for field cultivation. If, after all, the fly, drought or grasshoppers destroy the young plants, it will not cost much to harrow and sow the ground a second time, and those evils may thus, perhaps, be avoided.

Although some people will continue to raise turnips according to the broad cast method, yet there is no doubt but these roots may be grown to much greater advantage in drills or rows.—The following from the "Memoirs of the Board of Agriculture of New York," contains directions for raising turnips in the drill method, which have been tested by the experience and recommended by the writings of Mr. Feathers-tonhaugh, of Duanesburgh, N. Y. a celebrated practical and scientific agriculturist. "The soil being turned up in the fall, and exposed to the winter, is easily broken down in the spring, and by the first of June got into good tillage. Advantage being taken of the first settled weather, deep furrows, three feet apart, are opened, and well cleaned out with the expanding horse hoe.† Fresh dung well sodden down is carted into these furrows; some prefer to spread it at random on the surface, and rake it into the furrows. When the work is sufficiently ahead, these are covered with the plough, and become small ridges or ridgelets three feet apart.‡ By the time the field is dunged, and covered, the turnip drill, preceded by a light roller to flatten the ridgelets, is introduced. A steady hand will sow five acres in a day. When the crop gets into a strong rough leaf, the hoers are introduced to thin the plants, which are left about eight inches apart. These being suffered to fix themselves well in the soil, and their healthy leaves extending over the surface of the ridgelets, a light one horse plough then takes a slice from each side of the ridgelets, and throws it into the furrow. When this operation has killed the weeds, the expanding horse hoe is again introduced, which splits the soil in the furrow,

* Bordley's Husbandry tells us that "It is said to be a successful method of avoiding damage to young turnip plants by flies, to mix every two pounds of seed with a quarter of a pound of sulphur in fine powder, to stand ten or twelve hours; and then sow the seed." It might be well to try this receipt, but we doubt its efficacy, for the reasons before mentioned.

† A common horse plough will answer by being run back in the same furrow.

‡ The Farmers' Assistant says 27 inches.

and returns it to the ridgelets.* If weeds appear again this operation should be repeated, and it is better for the crop if it be repeated two or three times; for stirring the soil is the life of drill husbandry and row culture. It destroys successive crops of weeds, which otherwise would have remained in the soil; disturbs and destroys slugs and insects, and by producing more perfect tillage, permits new fibres to extend themselves in every direction, and opens the soil in the best way to the influence of the atmosphere."

Dr. Deane highly approved of the drill or row culture for turnips, and observed, "For two years past I have sown turnips in the drill way, in the poorest part of my garden, where a crop of pease had grown the same summer, and never had better turnips. They were sufficiently large for the table, though they grew so near together in the rows that the roots crowded each other, and were not sown earlier than about the tenth of August. The earth was hoed into ridges three feet apart, and a single channel seeded on each of the ridges. This is the more observable, as I have often sown turnips in the broadcast way, on the same spot, and at the usual time of sowing fall turnips, and never before raised any that were fit to eat. I have also for several years raised turnips in the field in the drill way. The ridges were raised in May with the cultivator, about three feet apart. They were kept clear from weeds till about the last of July, by the cultivator and the hand hoe, and then sown in single drills. Nothing more was necessary afterwards, except thinning and once hoeing. The crops were so much better than I have obtained from broad cast sowing, that I am induced to persist in and recommend the method."

DESTROY THISTLES.—A writer in our paper of last week, page 390, with the signature "Middlesex," is solicitous for information relative to the most successful mode of exterminating the Canada Thistle. The following we have known put in practice with perfect success. Let the thistles alone till they are in full bloom, and then cut them with a scythe. If they are cut when young, they produce fresh shoots, but if mown just before the seed is formed, the stem contains a hollow by which the dews and rain water descend into the heart of the plant and it soon dies. If, however, you cannot find leisure to mow them till the seed is formed, you may even then cut them down, and as soon as they have dried a little in the sun, rake them into heaps and burn them. It is possible that a few may spring up the next season, but two or three cuttings will entirely destroy them. It is said to be best to cut them in wet weather, as the rain will then sooner fill the stalk and cause the plant to rot immediately.

* A common horse plough would answer this purpose, but with less convenience and expedition.

NEW AGRICULTURAL IMPLEMENTS.

The New York Statesman of the 7th inst. contains the following account of two agricultural machines, the one for mowing and the other for raking hay.

"The instrument for cutting the grass consists of a circular plate about five feet and a half in diameter, the whole circumference of which is sharpened like a common scythe. This

is suspended under a car resembling a common cart, by a perpendicular shaft, the lower end of which rests upon a runner or gauge, and on the upper end of which is machinery receiving its motion from the wheel of the carriage, which is furnished with cogs for that purpose. The wheels are so multiplied, that the ordinary walk of the two horses by which the carriage is drawn gives to the scythe a very rapid horizontal motion. The machinery is placed so far towards the right side of the carriage, that the horses walk just at the edge of the grass. On the car is a seat for the driver, and a chest for the whet-stone and other implements needed in the process. A *self-sharpener* is occasionally used in putting the scythe in order.

"The patent horse-rake of Messrs. Pennock & Pierce, if possible, is a more ingenious and curious instrument than the scythe. It is very simple in its construction, and every one on seeing it is surprised that it was not sooner invented. The head of this rake is about ten feet long, and the teeth, which are about three feet in length, are inserted in both sides horizontally. To the head, at suitable distances, the traces of the horse are fastened, and behind is a handle by which the machinery is directed. When the rake is filled with hay, it is made to revolve by a slight effort of the person tending it, and the alternate teeth are filled. So easy and quick is the process of clearing and shifting its sides, that the horse keeps upon a fast walk across the field without stopping. In this way, the hay is rapidly raked into wind-rows, which by turning the rake are rolled into heaps. By means of this improvement, a man and one horse will rake twenty acres in a day. Mr. Peirce assured us that he could collect it as fast as several hands could cart it from an adjacent field to the barn. With some slight modifications it is capable of being applied to the collection of grain into sheaves. It is particularly useful when a shower is seen rising, and the farmer is in haste to secure his hay or grain. The whole expense of this instrument, including the patent and the right to use it forever, is twelve dollars."

These machines have been recommended by the certificates of Dr. Mitchell, and several other gentlemen of science and respectability.

From the Essex Register.

CELEBRATION AT SALEM, FOURTH JULY.

What gave peculiar novelty to the performances in the Meeting-House, on Friday last, was the novel, interesting and candid remarks of the venerable Col. PICKERING, preparatory to the reading of the Declaration of Independence. The Col. commenced by stating, that he had acceded to the call of his fellow-citizens to read the Declaration of Independence, in order that he might lay before them some interesting information on the subject, in his possession. He first commented on the propriety of anniversary celebrations, and their early origin with the feast of the passover observed by the Jews, in commemoration of the deliverance of their offspring from that destruction which overwhelmed the children of their oppressors. He then gave a concise statement of the motives which led to that declaration, and the measures that were taken first to avert its necessity, and next to prepare for its hearty adoption and support.—That petitions and remonstrances were exhaus-

ted, without producing any suspension of the determination of the arbitrary council of England, to "bind us in all cases whatsoever, without our consent." That these, though unavailing at St. James, had their effect at home. That then the public mind was gradually prepared for this decisive measure, and foreign auxiliaries sought. That no foreign state was willing to aid us, unless with the view to lessen the power of Great Britain, and that therefore every step short of Independence, would have precluded foreign assistance. The Col. then proceeded to give an account of the manner in which this subject was introduced into Congress: He stated that there was no man living able to give so good an account of it as the venerable JOHN ADAMS; that he had written to him in the last August on the subject, and he now gave the facts obtained from him. The motion which produced the Declaration, was made on the 10th of June, 1776, by Richard Henry Lee, from Virginia, the largest of the Thirteen United Colonies, who was authorised to make it by the votes of his constituents, the Assembly of Virginia. Mr. Adams seconded the motion, Massachusetts being at that time the second state.—The Col. here alluded to the ability and zeal of President Adams in carrying through this measure. He observed of him, that he possessed that "BOLD AND DARING SPIRIT," without which no revolution could be successfully accomplished. A committee of five was appointed on the subject, consisting of Mr. JEFFERSON, Mr. ADAMS, Dr. FRANKLIN, Mr. SHERMAN, and Mr. LIVINGSTON. Mr. Jefferson, though the youngest on the committee, was chairman, he having one vote more than Mr. Adams. That Mr. Jefferson had come into Congress with great reputation as a writer—and although he was a silent member of that body, yet he was most useful on committees, and felicitous in his writings. That Mr. Adams had made use of every exertion to procure votes for Mr. Jefferson, in order to place him at the head of the committee. That the committee met and appointed Mr. Jefferson and Mr. Adams a sub-committee. That Mr. Jefferson urged on Mr. Adams to write the Declaration, and Mr. Adams urged Mr. J. to do it. That Mr. Jefferson at last consented, and the next day submitted the original draft, as it was presented to Congress. That Mr. Adams thought the only objectionable part of it was that in which Geo. III. was styled a *tyrant*—that he considered that as too personal—that he only considered him such officially, and that he was deceived and misled by his Cabinet. He did not, however, state any objection to Mr. J. as it was afterwards to be submitted to the whole committee, and the feelings and temper of the people were fully up to the tone of the declaration. That he thought some of the most beautiful passages were afterwards stricken out by Congress, particularly that in which it was enumerated as one of the evils of our Colonial state, that the Parliament had refused to allow the colonies to prohibit the importation of slaves, and had thus entailed upon them the evils of a slave population. The sub-committee afterwards reported to the committee, who did not suggest a single alteration or amendment. The committee then reported the Declaration to Congress on the 1st of July, 1776; it was discussed and amended on the 2d, 3d, and 4th of July, and adopted on the latter day, about a quarter of the reported De-

eration having been stricken out. Mr. Pickering differed from Mr. Adams in opinion, and thought the Declaration improved by the amendments. In this opinion of Col. Pickering's we most readily concur, as we consider nearly every alteration made by Congress, with the exception of those in relation to slavery, as a fatal amendment to that instrument. Most of the ideas in the Declaration had been repeatedly maintained in previous papers, especially a Declaration of Rights in Massachusetts, issued in a lucid interval by James Otis, and issued and polished by Samuel Adams. That great credit, however, was due to Mr. Jefferson for the ability of the compilation, and we heartily accord the same degree of credit to the candor of Col. Pickering.

FOR THE NEW ENGLAND FARMER.

MR. EDITOR—I have never been a believer that it was to be found a mean of curing Hay to the extent which has been advocated. But I have been convinced, and several years have confirmed me in the practice, that the application of a peck of salt or more a ton of hay is very beneficial.

1st. It tends to check an undue degree of fermentation when the hay is not quite made enough.

2d. I have found the hay I have salted less apt to rot and lose its head and most nutritive parts, particularly clover.

3d. It has come from the mow in the spring much more green and saleable.

4th. Much less dust or dry mould has appeared than has been the case in all other large parcels of hay here no salt has been used.

The writer is now applying it in the manner herein stated; but more particularly to his clover. If it does well in this neighborhood, how much better must it do where salt is necessary to the thrift of cattle, and adds, or want of a saline atmosphere, so much to the value of the manure of the stock.

W.
Dorchester, July, 1823.

FOREIGN.

PROGRESS OF THE FRENCH IN SPAIN.

Paris dates to the 21st, and Portuguese to the 30th of May, have been received. The Paris accounts state that the French in Spain are advancing to Madrid with scarcely a show of opposition. On the 15th of May, they tell us, the Head Quarters of the Duke D'Angouleme were at Aranda, which is about 75 miles north from Madrid. Gen. Obert was at Almazan, about 65 miles north west from Madrid. This commander, they say, is perfectly well received every where, and communicates with the Royalist Gen. Bessieres, who has taken 200 men, the same number of muskets, and four cannon from Ballasteros. The latter is retiring on Valencia, and suffers losses by desertions. On the 11th, Marshall Oudinot's vanguard proceeded from Valladolid to the Douro, where as well as at all other places, he was received with lively enthusiasm. Gen. Morillo's army, according to these accounts, was reduced to about 170 soldiers. Marshall Moutcy's troops were full of ardor. Mina's corps is little less than annihilated; and the Baron D. Errolles is in pursuit of him. The Baron is of opinion that if Mina is vigorously pursued, his destruction may be accomplished in eight or ten days.

The above is the substance of Paris accounts, by which, after making suitable allowance for "false facts," we learn no more than that on or about the middle of May, the French were proceeding onward, without encountering much opposition. In this there is nothing remarkable, because neither party anticipated much serious fighting till the French had arrived at Madrid, when the Spaniards were to "cry havoc, and let slip the dogs of war!" The Paris dates do not come down to the 20th May, about which time, according to news received by Capt. Tunison, a great battle was fought, and the French were defeated. Neither

do we hear any thing more of Gen. Mina's masterly manoeuvre in gaining the rear of Moutcy's army. Indeed, the only thing certain about these reports is that no reliance is to be placed on them, and we must wait till Time, the Great Teacher, shall condescend to substitute *reality* for a mass of *conjecture*, the only food for curiosity with which, at present, he condescends to gratify us.

From Portugal.—An arrival at Portsmouth from St. Ubes, has brought Portuguese accounts to the 30th of May. These announce a revolt in Portugal against the constitutional system. They say that a certain Brig. Gen. Sampayo, with his regiment, revolted in the neighborhood of Lisbon, wrote a letter to the Brigadier Governor of arms, announcing his intention to bid "farewell to anarchy," and that the infant Don Miguel, one of the sprigs of royalty, had "quitted the paternal roof, and gone to join himself with this handful of deluded men." They state, however, that the "government has taken the most efficient means to stop the progress of the disorganizing faction. The troops continue true to their oaths, and obedient to their general, in whom they have the utmost confidence." Other accounts state that the Portuguese ministers had resigned. Indeed the reports are so contradictory from Portugal, as well as Spain, that they do not present a foundation on which a yankee of any prudence would hazard a *guess*; and no one can say either what is or what is to be in Spain or Portugal. The usual channels of intelligence seem to be filled altogether with such false and contradictory reports, that they are no more to be regarded than the tattle of a superannuated gossip, who dreams with her eyes open, says every thing "which comes uppermost," and believes every thing she says, because she has said it.

DOMESTIC.

The Fourth of July.—This National Festival has been generally celebrated, in various parts of the Union, with the customary demonstrations of joy and festivity. An account of the Processions, Orations, Odes, Toasts, &c. &c. indicative of the sentiments and feelings which inspired the votaries of Independence, would fill all our columns, and still much that is memorable would be left untold. We must therefore refer our readers to other sources for details on this subject, and merely remark that judging from what we have seen and heard, we are led to conclude that the Festival of Freedom was never celebrated in a manner more worthy of the events it was intended to commemorate, or the principles it was designed to inculcate and hold in perpetual remembrance.

Fatal Accident.—The exhibition of fire works at Salem, on the evening of the 4th inst. was attended with a very melancholy event. A chest placed under the stage, containing about 300 rockets, was accidentally set fire to by a rocket, which having been thrown from the stage, glanced towards the chest, and communicated a blaze to the rockets within, which took different directions. Many persons, principally boys, who had placed themselves very near the stage, were injured by the explosion which followed, and some fatally. Three boys have since died of the wounds received by this dreadful accident. Others were wounded, but it is thought that they will recover.

Caution to Parents.—The New York Commercial Advertiser states that an infant of about nine months was left by its parents in the care of its sister about seven years old, who gave it laudanum to quiet it, and its death in a few hours was the consequence.

On Tuesday, June 10th, before the Horticultural Inspection Committee, in New York, were exhibited two fine Cauliflowers, measuring 26 inches; six summer lettuces of a fine new kind, the largest of which weighed 2 lbs. 6 1-2 oz.; four fine compact lettuces of a new kind, and a fine plant in bloom of *White Moss Rose*, supposed to be the first that has flowered in this country.

John McLean, late Commissioner of the General Land Office, has been appointed, by the President of the United States, to be Postmaster General, vice R. J. Meigs, resigned.

Geo. Graham is appointed by the President to be Commissioner of the General Land Office, vice John McLean resigned.

The New York Commercial Advertiser states that Mr. J. Wilson, of this city, has been robbed of his pocket book, containing nearly 2000 dollars, between Philadelphia and New York.

The Providence Journal states that seven girls, in the factory of Mess. Greene, Tillinghast, & Co. near Wickford, from the 22d to the 25th ult. both days included, on 14 looms, wove 3910 yards of sheeting.

Erratum.—In our paper of June 28, page 379, in the article with the signature "Herdsmen," for meal-bags, read meal boxes.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but those who pay within *sixty days* from the time of subscribing will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the Publisher) until arrearages are paid.

Complete files from the commencement of the paper in August can be furnished.

Agents who procure seven subscribers, and become responsible for the payment, will be entitled to a copy gratis, and in the same proportion for a larger number.

The following ODE, written by a member of the Washington Society, in Boston, was sung at the late celebration of Independence, by Mr. Benj. Brigham. We think that the birth day of our National Freedom, fruitful as it has been, and we hope ever will be, in similar productions, has rarely exhibited any thing of the kind of equal excellence.

ODE.

Air—"To Liberty's enraptur'd sight."

When first with ray divinely bright,
Forth beam'd fair freedom's western star,
O'er ocean, wave, and mountain height,
Its heavenly radiance gleam'd afar;
Admiring nations gaz'd with awe,
And monarchs veil'd their dazzled eyes;
Earth, sea and sky enraptur'd saw,
And bade their swelling anthem rise.
Star of the brave, the great and free!
Hail! glorious star of Liberty!

Then rousing from his rocky rest,
Stern Independence grasp'd his spear,
And toss'd on high his haughty crest,
And bade his glittering banner rear.
Earth trembled 'neath his giant tread;
Shook, pale Oppression's gloomy hold;
The red eyed Despot quak'd with dread,
As far his lofty cherus roll'd.
Where'er thou darrest all are free!
Hail! glorious star of Liberty!

"Columbia's Sons arise!" he cried,
"To glory, fame and honor rise!"
Each cavern'd rock and hill replied,
In echoes to the list'ning skies:
They rose in virtue's armor bright,
Fierce on their tyrant foes they sprung
While cheering on the patriot fight,
On high the heavenly minstrels sung;
The star of Freedom shines o'er thee!
Columbia thine is Liberty!

As rolls the torrent to the main,
Resistless from the mountain side,
Resolv'd to rend th' Oppressor's chain,
They burst upon his banner'd pride:
With firmer step each Warrior trode;
A surer mark each weapon found;
Each breast with holier fervor glow'd;
As proudly rose the thrilling sound,
Bright harbinger of victory!
Hail! radiant Star of Liberty!

Thus, on to glorious fame they rush'd:
With vict'ry's wreath their brows were crown'd;
And War's dread tempest, now, is hush'd,
Now, Peace, mild beaming, smiles around.
Adown the peaceful vale, no more
The cannon's voice of carnage tells;
But far along our length'ning shore,
Th' inspiring note of triumph swells,
All hail! Columbia, great and free,
Bliss home of Peace and Liberty.

And while our bosoms bound with joy,
Forget not we the mighty deed;
Let mem'ry breathe a mingled sigh,
For those who for our freedom bled.
Pledge deep to them the sparkling bowl;
Let their high praise in song arise;
Wake the far echoes of the pole,
In strains aspiring reach the skies.
Brave patriot band, we raise to thee,
The swelling voice of Liberty!

From the National Intelligencer.

ROTARY PRINTING.

In one of the letters from London concerning Perkins' improvements on the Steam Engine, there is an incidental mention of an invention for printing calicoes, by means of an engraved cylinder, which passing over the cloth, performs the work that was formerly done by manual labour.

It is so singular as to be worth remark, that, more than twelve months ago, Mr. Peter Force, printer and bookseller, of this city, disclosed to the writer of this the principle of an invention precisely such as that now ascribed to Mr. Perkins. Mr. Force was at that time engaged in having a model made, and perfecting his invention—which work, it appears, he soon after accomplished; for we discover, from the official printed list of patents issued during the year 1822, that on the 22d day of August last, Mr. Force obtained a patent for "an improvement in the machines for printing paper, cloths, books, &c." We yesterday saw the specification of this patent, wherein the scope of the invention is thus prefixed to the description of it:

There are six different machines for completing the improved paper hangings, calicoes, letter-press printing, &c.

1st. For laying on the ground work all of one colour.

2d. For do. of different colours.

3d. For laying on all the different colours, at the same time where they are separate.

4th. For laying on all the different colours at the same time where they are interspersed.

5th. For laying on all the different colours at the same process, where they are intermixed.

6th. For printing books, &c. both sides of the paper, &c. at once.

We do not mean to detract an iota from the merits of Mr. Perkins' invention, whatever they may be valued at, much less from his universally-acknowledged skill in Mechanism. It is no more than just, however, that this useful invention of our townsman should be made known, to the end that he lose neither the merit or profit of what is undoubtedly his original invention.

NEW ENGLAND AND VIRGINIA.

Extracts from the Journal of a Virginia traveller in New England.

In the excursion from which I have just returned, I had an opportunity of looking more closely than I had done before into the domestic and agricultural economy of the New England farmers. And I have been astonished to observe how much less house-keeping and the cultivation of the soil costs here, than they do among us. A family here, which employs one house servant, lives full as much at ease, as one in our part of the country that employs four—with only this special exception, that, in Virginia, the mistress has a great deal the most trouble. Consider the difference, as to expense, between employing four unproductive hands and only one!

I have before remarked that the farms here are small. They are generally cultivated by the proprietor and his sons. And if the whole product is less than on the large plantations in Virginia, the surplus is proportionably much greater; and the expense of clothing incomparably less. I have no doubt but that the nett profits of farming in New England are greater than in Virginia. But this will scarcely be be-

lieved here. If it is heard that a man owns a thousand acres of land, and fifty negroes, it is imagined that there is no end to his wealth. But it is not considered that out of fifty slaves, on account of old age, childhood, disease, and other causes, scarcely ten or twelve able bodied laborers can be found, whose services are to be regularly depended on. Now if the planter grows corn enough to feed all his dependents, and tobacco sufficient to fill fifteen or eighteen hog-heads, he is thought to do exceedingly well. This tobacco, at an average price, will produce from one to two thousand dollars. This is all the planter has to pay taxes, blacksmith's and doctor's bills, the expense of clothing, and every thing else in the way of family expenditure, where there are perhaps sixty persons. The truth is, that many planters in Virginia begin to feel that the present mode of cultivating the soil is so expensive, and the price of produce so low, that a change will soon become necessary and inevitable. Free labor costs less and produces more than that of slaves. Hence while Virginians are nominally rich, they are actually poor; and will be so until some one shall be wise enough to devise a plan for changing the state of things among us. When shall it once be!

An Irishman who had never fired a gun in his life, took it into his head to go a shooting. I was not long before he saw a little wood pecker engaged in perforating a small cherry tree. Pat crept slowly as far as he durst without alarming the bird, and after making two or three circumbendibus around the tree, as the little feathered mechanic performed a similar revolution round its trunk, he tho't he had at last got a chance for a shot; so shutting both eyes fast he blazed away. The bird, more scared than hurt by the attack, took to his wings, while Pat sure as he could be that he had bro't down his game, commenced searching for it among the weeds at the root of the tree. As he was thus engaged, a frog started up before him and began hopping around the tree. Pat in an ecstacy of joy at having found as he supposed the object of his search, soon seized poor croaker, and while he eyed his lantern jaws and freckled skin with somewhat of an amazement, exclaimed, "Arrah, now, but sure you were a pretty bird before I shot all the feathers off you."

A gentleman mistaking a very small lady who was picking her way over a dirty channel, for a very young one, snatched her up in his arms and landed her in safety on the other side, where she indignantly turned up a face, expressive of the anger of fifty winters, and demanded why he dared to take such a liberty?—"Oh! I humbly beg your pardon, said the gentleman, I have only one amend to make?"—and he again caught her up and placed her where he had first found her.

A distinguished member of the New-York convention of 1821, after ending an elaborate speech and supposing his chair to be behind him (which unfortunately was not the fact) while in the act of seating himself, came to the floor rather abruptly. Another member, not noticing the mistake, rose immediately to reply to the speech but was silenced by a member calling out, "order, order, there's another gentleman on the floor already!"

NEW ENGLAND FARMER.

PUBLISHED BY THOMAS W. SHEPARD ROGERS' BUILDINGS, CONGRESS STREET, (FOURTH DOOR FROM STATE STREET.)

VOL. I.

BOSTON, SATURDAY, JULY 19, 1823.

No. 51.

From the second volume of Memoirs of the Board of Agriculture of the State of New York.

OBSERVATIONS

On the most economical method, by which farmers in this country, may supply themselves with a sufficient supply of succulent feed, for their stock in the winter season.

[By LEVI MCKEAN, of Dutchess.]

There is nothing in which I consider the American farmer to be so far behind the best European cultivator, as in the suitable provision of green or succulent food, for his stock in winter. It is to this deficiency, that we must ascribe the loss that we so often hear farmers complain of, when they have attempted to make calculations on the expense of fattening of beef and mutton, in the winter, on artificial feed; or, the expense of keeping dairies, from November to May, all of which time cows should have some rich feed, other than dry hay, or they cannot afford any profit to the farmer.

For my part, I have long ago learnt from experience, that to fatten beef or mutton: or keep a dairy; or to keep ewes to rear lambs for the market, on corn, or other farinaceous feed, without green or succulent food, must always disappoint the hopes of every farmer, who will like the trouble to count the cost of any experiment he may make in that way; and unless the farmers of this country, can succeed in finding some green article or root, to feed with his hay and corn, he can never make a calculation of profit on his winter's feeding.

This subject has long occupied the attention of all those farmers, who calculate the cost of the article they send to market, and has led them, with much solicitude, to endeavor to find some article to cultivate for this purpose, without any one, as I believe, having yet been able to come to any practical conclusion, as to what article was best adapted to our climate and soil, or whether any article can be found to answer the purpose.

Without system, no business can succeed, and a systematic farmer should always calculate on results, that would prove as certain as possible, especially in this country, where, if he fails in the growth of a crop of the article on which he has made his principal dependence, for his winter feed, he cannot supply the lack by purchase, without giving so extravagant a price, that his stock will hardly, in the spring, pay for the wintering: or he must force his stock into market, lean, in the fall, when for the want of regular fairs for the sale of stock, which we much want in this country, he must generally sell at such prices as to sacrifice his summer's feeding.

The above considerations, have rested on my mind with such weight, that for several years I have been led to make experiments to supply myself with the necessary store of feed, none of which have been satisfactory, either by reason of the great labor that most of the artificial crops require, at seasons when all the labor of the country is necessarily otherwise engaged; or by reason of the uncertainty of the crop experimented; or its unfitness, when produced, for feed in this climate.

Every man who has read English books on husbandry, is at first struck with the important use they make of their turnip crops in that country, and eagerly engages in the cultivation of an article, the general growth of which has formed an important era in the annals of agriculture in that country. But alas, how often has the American farmer been disappointed in the result of such experiments as have been most judiciously made, by reason of the difference of soil and climate.

The season of sowing field turnips for stock, in this climate, should be from the 10th to the 15th of July, which is in the very midst of our harvest, and is a very hurrying season, when labor, is not only very high, but difficult to be obtained. But notwithstanding these difficulties, some years ago I followed a good field of about eight acres, and sowed it with the different kinds of turnip seed that are now most approved of in England, all of which came up well, and progressed with great promise, until the roots were of the size of a walnut, when the grasshoppers vent into my turnips, and entirely eat them up.

The next year I did not sow any, but in the year 1817, I sowed a very large field, that did well as to growth, but when it became fall, they had to be drawn and housed, or put in *pie*, which was a great labor; and in the winter, when they were to be fed to my sheep, they were to be unhoused, cut and fed in troughs; and long before spring, when they were most wanted, they became perous and light, and in fact, were a very expensive feed for my sheep, in proportion to their value as an article of food. From which I then concluded, that even when the common turnip grows well, they are not a profitable article for feeding, unless we could feed them on the ground, as is the practice in England; but which, from the severity of our winters, we cannot do. I have since several times tried the common turnip, but without profit, or any other satisfaction than was derived from the above experiments.

I have also, for the last four years, raised the *ruta baga* with some success, and have used them as a feed for every description of stock, with considerable satisfaction, especially after mid-winter, before which time, they do not appear to be properly ripened for use. But there is a great deal of labor about this crop, that must also be done in a very hurrying season of the year. That the result of all my experiments have convinced me, that in this country, where every thing is so dissimilar from that of England, that no English theory will do for the American farmer.

In England, the chief expense of the farmer's crop, consists in tythes, direct and assessed taxes and rent. The cost of labour is nominal, in comparison with what it is in this country. While here, thank God, there is no tythe, the rent is small, and the taxes are nominal; and labor is every thing. Therefore, in England, it becomes the interest of the farmer to use every means in his power, to obtain the greatest possible products from a given quantity of land, by laying out much labor on it. But in this country, it is the interest of the farmer, so

to husband his land, that he ensure the greatest possible returns for his labor. On this ground of calculation, I have finally concluded, after this year, (in which I have laid out considerable, on preparation for turnips, that owing to drought, have entirely failed,) to give up my turnip and potatoe crops; for all the objections that lie against the one, are equally applicable to the other, excepting that the potatoe is the best feed, when produced, but the expense of producing a crop of potatoes is very great. And while I have come to this conclusion, I must confess I have been at a loss to find a crop to substitute for them.

It has so happened, that whenever I have resided in cities, it has been as a boarder, and not as an housekeeper; and although I had often seen the *Jerusalem Artichoke*, (*Helianthus Tuberosus*.) in markets, I had never eaten them, or known any thing of the manner by which they were produced: and in fact, I had never given any attention to the article, until the last spring, when, being in a neighbor's house, I observed a child to come in with a present of a basket of artichokes, which I noticed were of a size and form similar to the sweet potatoe of the southern states. But still I made no enquiry about them at this time; but after I returned to my own house, I recollected the basket of artichokes, and determined to enquire where and how they grew, and what use was made of them? when I learnt, that they were grown in a garden in this village, (Poughkeepsie,) and that they were a very hardy and productive vegetable. I also learnt, that when once planted, they required no further cultivation, and that they had no enemies during their growth but hogs, who were very fond of them. This was very satisfactory information, as I am well persuaded, there are no animals that pursue nutritious food with more attention to its fitness to support animal life, than hogs: and I concluded at once, that this root might be useful to the farmers of this country, as a substitute for potatoes and turnips.

On the above information, I went to examine the garden where this article had grown, and found, that a small spot of ground, not exceeding 20 by 3 feet, must have produced several bushels of artichokes, which I soon persuaded myself must be profitable as a crop, and was determined to procure some of the seed: and in the mean time, I endeavored to collect all the information of the growth and produce of artichokes in my power.

It is proper to observe, that an English book on agriculture, can never be read with any certainty, as to the results of any experiments which they pretend to detail; as their most experienced writers do not describe any certain quantity, either of land or products, by any certain denomination of measure; and although some of their writers pretend to understand something about a *statute acre*, while describing the results of their experiments, and speak of their products as being measured in the Winchester bushel, yet in the next page, or perhaps in the next paragraph, you will find them speaking of acres of seven yards to the perch, and other measures

that no one can comprehend; and of estimating their crops of esculent and tuberous roots, sometimes as being measured by the *Winchester bushel*, and in other instances estimating the *manistry pounds to the bushel*; and at other times they are measured by *barrils or loads*, the size of which no one can conjecture. Therefore, in our inquiries, we cannot say with certainty, what capacity of measure is meant by those who relate the results of experiments, that have been made in that country, either as to the ground occupied, or the crop produced. Therefore, in order to come to any satisfactory result, in my inquiries relative to the comparative value of artichokes, as a crop, I have concluded that the land planted with potatoes, (with which I shall compare this crop,) must have been measured with the same instrument that the acre was, which was planted with artichokes; and that the same measure was used, to ascertain the quantity of each crop.

Mr. Peters published his book entitled "*Winter Riches*," as long ago as 1772, in which he speaks in very high terms of artichokes, as a crop to feed all kinds of stock on; and expresses his astonishment, that they are not more grown, and that they are held in such low esteem, even for human sustenance.

He asserts, that he has raised from one acre of land, from 70 to 80 tons; and that he is of opinion, that 3.6 tons may be raised from seven acres; from which it will appear, that if Mr. Peters had only 70 tons, he must have had 2.113 bushels of artichokes, at 65 pounds to the bushel, (which is the most that a bushel of the best potatoes can be made to weigh;) but if he had 80 tons, then his acre of artichokes produced him the prodigious quantity of 2,555 bushels, of the same weight.

From the above example, it will be seen, that Mr. Peters did not exceed probability, in expecting 3.6 tons from seven acres, when planted for an ordinary crop, which would be 13,616 bushels of artichokes.

Another English writer estimates an ordinary crop of artichokes to be equal to 150 Winchester bushels per acre, when planted, without the expense of manure. He also considers this crop to possess great merit, from its certainty upon any soil, and its not requiring manure, and being proof against frost.

I shall now endeavor to compare this crop, as to its value, with potatoes.

Arthur Young has given us several courses of experiments, made by himself, on a good soil, with different sorts of potatoes, one of which produced 120 bushels, without manure, and the rest, that were highly manured, with different sorts of dressing, and at great expense, produced from 110 to 650 bushels to the acre. Those producing the least crop, were manured with 30 loads of yard compost, and those producing the most, were two lots which yielded exactly alike, one parcel being manured with 6 loads of night soil, and the other with 10 loads of bones. And in another course of experiments, probably made the next year, on the same ground, with the same sorts of potatoes, and the same kinds and quantity of manure; he obtained, without manure, 140 bushels; with the yard compost, 110 bushels; from the night soil, 500 bushels; and from the bone manure, 610. And two other experiments, in different parts of England, have given results from the same kind of soil;

one acre, without manure, 130 bushels; one acre, 210 bushels, manured with wood ashes, which was the smallest crop with manure; and the largest crop, manured with 53 loads of farm yard dung, was 100 bushels.

The above experiments, having been made by the best farmers in England, or perhaps in the world, it will be observed, that the above products in artichokes, may be compared with them, to very great advantage.

Therefore, having obtained the above intelligence, I sent to Grant Thorburn for a bushel of artichokes, for seed, in order to make an experiment of their growth in this country. He sent me a peck, saying that he had only sent that quantity, as he did not know that I should approve of the price, which was \$5 per bushel. This seed I received the 6th of May, and immediately proceeded to plant it, on a soil in moderate tilth for wheat.

This peck of seed, I cut as small as was proper, in order to make it go as far as possible in planting. And while I was superintending the planting of this seed, the boy, who assisted me, observed, that there were some artichokes growing on a certain place on my farm, which, when examined, I found to be true, for I found a poor exposed space of ground (not larger than a common breakfast table) covered with artichokes, from which I dug about five pecks of fine large tubers, which, notwithstanding the tops were grown more than a foot high, I planted with the others. And although they were planted quite too late, I proposed, on some future occasion, to publish the result of this experiment. At this time, they looked very fine, and the ground now appears to be full of large roots.

My present opinion, from all I have seen and heard of artichokes, is, that they are the best suited for cultivation, in this climate, — — — for hogs, sheep, and dairies, of any article that we have yet tried.

Since last spring, I have examined several where they are growing wild, and find that they every where yield a bountiful increase, more than could possibly be expected from potatoes or turnips, or any other article growing on the same soil, and under the same circumstances, and every where indicate, that if cultivated and manured in the same manner that other crops are, the article would maintain the same superiority it does in a state of nature.

I have found artichokes growing in hedge rows, and among shrubbery in the borders of gardens, to very great perfection, where they were perfectly shaded, and apparently overrun with shrubs and weeds, and yet, on examining the roots, they were abundant, and larger than common potatoes, from which I concluded, they would even grow to some perfection in woodlands, where the soil was soft and mulchy.

As to the best method of culture, I cannot say much, as I have no experience, and can only speak from the conclusion I have drawn from observing the natural habits of the plant: from which I would, however, venture to recommend the following course of cultivation, which may be tried on any kind of soil, with great certainty of a good return, in proportion to the quality of the soil, or its improvements. But to obtain the best return, I would choose a field of a size proportioned to the amount of green food I might want for my winter's feeding, and of a pretty good soil. If otherwise convenient, take

up some orchard ground, on account of the benefit that I am persuaded this crop would be to the trees.

The ground should be ploughed and manured, and then drilled in the manner that is usually done for potatoes, and about the same quantity of seed planted, at the same distance in the rows. In the fall, the farmer should take up such a portion of the tubers as he would probably want for his winter feeding, which will be done cheapest with the plough. The remainder of his crop may be left, to be taken up early in the spring, as there is no way in which they can be so well preserved as to let them remain in the ground during the winter.

The tubers that are taken up in the fall, should be housed in the same manner that potatoes usually are, altho they are not so liable to injury by frost, as either potatoes or the ruta baga.

The next spring, when all the crop has been taken off the land, the ground should be well and deeply ploughed, as early as possible, which is all the cultivation that will again be wanting to secure the most abundant crop. And when the ground is to be appropriated to some other course of crops, it will only be necessary to turn a sufficient number of hogs into the lot, and they will entirely eradicate the artichokes, which cannot otherwise be accomplished.

Besides the use of this crop for stock, which the above mentioned authors consider to be equal to potatoes, they are also recommended highly as an article of human diet. It is true that when boiled, they do not possess that peculiar farinaceous quality, that is so much esteemed in the best sorts of potatoes; but it is said when roasted, they are a very delicate article for the table: their taste then very much resembling the ground nut of this country.

And from all my information in relation to this plant, I am persuaded that if every poor family in Ireland, and elsewhere, could devote one quarter of an acre of land to this article, they would at least be saved from famine for seven months in the year.

I submit the above observation, to the consideration of the enlightened members of the Agricultural Society, with my recommendation, that they will at least make an experiment, on a small portion of medium good soil, such as they usually devote to their potatoe crop: and I promise myself the satisfaction to see this crop generally raised throughout the country, as a cheap, certain, and profitable substitute, both for potatoes and turnips, where the object is the feeding of stock from November to May: by which, the farmer will be able to bring his ewes and lambs into his pastures in good health and condition, instead of the miserable plight in which they are now seen during the early spring months.

The dairy farmer will also, by the cultivation of this article, instead of seeing his cows shrunk and dried up in winter, receive a rich supply of milk at that season, when it is most valuable; and when his cows calve, he will have the means of fattening the calves, by which he will be saved both the loss and the shame of carrying lean veal to the market, to be sold for little more than the skin is worth. And he will find an article, on which to feed his teams, by which he will at least save one half of the dry short provender that farmers are now obliged to feed, and by which the health of his teams will be much

improved; and on the whole, I am persuaded, that by the cultivation of this productive vegetable, the economical farmer will be greatly enriched. If all the above benefits are not realized, I shall be much disappointed, as my reliance on this crop is so great, that I intend, the ensuing season, to plant all the seed I can possibly procure, at a reasonable expense.

DESCRIPTION OF A MOULD-BOARD.

Extracted from a letter, dated March 23, 1798, from Mr. Jefferson, to Sir John Sinclair, President of the Board of Agriculture at London. printed in the 4th volume of the Transactions of the American Philosophical Society in Philadelphia.

In a former letter to you, I mentioned the construction of the mould-board of a plough which had occurred to me, as advantageous in its form, as certain and invariable in the method of obtaining it with precision. I remember that Mr. Strickland of York, a member of your board, was so well satisfied with the principles on which it was formed, that he took some drawings of it, and some others have considered it with the same approbation. An experience of five years has enabled me to say, it answers, in practice, to what it promises in theory. The mould-board should be a continuation of the wing of the ploughshare, beginning at its hinder edge, and in the same plane. Its office is to receive the sod horizontally from the wing, to raise it to a proper height for being turned over, and to make, in its progress, the least resistance possible; and, consequently, to require a minimum in the moving power. Were this its only office, the wedge would offer itself as the most eligible form in practice.* But the sod is to be turned over also. To do this, the one edge of it is not to be raised at all; for to raise this would be a waste of labor. The other edge is to be raised till it passes the perpendicular, that it may fall over with its own weight. And that this may be done, so as to give also the least resistance, it must be made to rise gradually from the moment the sod is received. The mould-board then, in this second office, operates as a transverse, or rising wedge, the point of which sliding back horizontally on the ground, the other end continues rising till it passes the perpendicular. Or to vary the point of view, place on the ground a wedge of the breadth of the ploughshare, of its length from the wing backwards, and as high at the heel as it is wide. Draw a diagonal line on its upper face, from the left angle, at the point, to the right upper angle of the heel. Bevil the face from the diagonal to the right bottom edge, which lies on the ground. That half is then evidently in the best form, for performing the two offices of raising and turning the sod gradually and with

the least effort; and if you will suppose the same bevil continued across the left side of the diagonal, that is, if you will suppose a straight line, whose length is at least equal to the breadth of the wedge, applied on the face of the first bevil, and moved backwards on its parallel, with itself and with the ends of the wedge, the lower end of the line, moving along the right bottom-edge, a curved plane will be generated, whose characteristic will be, a combination of the principle of the wedge in cross directions, and will give us what we seek, the cross board of least resistance. It offers too this great advantage, that it may be made by the coarsest workman, by a process so exact, that its form shall never be varied a single hair's breadth. One fault of all other mould-boards is, that, being copied by the eye, no two will be alike. In truth, it is easier to form the mould-board I speak of with precision, when the method has been once seen, than to describe that method either by words or figures.

ANALYSIS OF SOILS.

"In cases when the general nature of the soil of a field is to be ascertained, specimens of it should be taken from different places, two or three inches below the surface, and examined as to the similarity of their properties. It sometimes happens, that upon plains the whole of the upper stratum of the land is of the same kind, and in this case, one analysis will be sufficient; but in vallies, and near the beds of rivers, there are very great differences, and it now and then occurs that one part of a field is calcareous, and another part siliceous; and in this case, and in analogous cases, the portions different from each other should be separately submitted to experiment.

"Soils when collected, if they cannot be immediately examined, should be preserved in phials quite filled with them, and closed with ground glass stoppers.

"The quantity of soil most convenient for a perfect analysis, is from two to four hundred grains. It should be collected in dry weather, and exposed to the atmosphere till it becomes dry to the touch.

"The specific gravity of a soil, or the relation of its weight to that of water, may be ascertained by introducing into a phial, which will contain a known quantity of water, equal volumes of water and of soil, and this may be easily done by pouring in water till it is half full, and then adding the soil till the fluid rises to the mouth; the difference between the weight of the soil and that of the water will give the result. Thus if the bottle contains 400 grains of water, and gains 200 grains when half filled with water and half with soil, the specific gravity of the soil will be 2, that is, it will be twice as heavy as water, and if it gained 165 grains, its specific gravity would be 1.825, water being 1000.

"It is of importance, that the specific gravity of a soil should be known, as it affords an indication of the quantity of animal and vegetable matter it contains; these substances begin always most abundant in the lighter soils."

DAVY.

To purify the muddy water of rivers or pits.

Make a number of holes in the bottom of a deep tub; lay some clean gravel thereon, and

above this some clean sand; sink this tub in the river or pit, so that only a few inches of the tub will be above the surface of the water; the river or pit water will filter through the sand, and rise clear through it to the level of the water on the outside, and will be pure and limpid.

Recent experiments have shewn that tiles are greatly improved, and rendered impervious to water and frost, by being rubbed over with tar before they are laid on the roof.

THE REAL HYSON TEA PLANT,
Introduced into the United States, and now cultivated in North Carolina.

A B——n, an old traveller in the Indies, and at present an inhabitant of Moore county, N. C. is well acquainted with the growth and cultivation of the above tea plant in foreign as well as this country, and also with the mode and manner of curing its leaves; and gives to the public the following communication respecting it:

As soon as the leaves arrive to maturity they should be gathered in the morning, while the dew is upon them, after three or four days of good sunshine weather in succession previous to gathering, and clear from any rain falling in the interim to wet them: then dry up the dew on them as early as you can in the shade, (say in a room where there is as little wind or air stirring as possible,) after which, put the leaves into a stone jar or jars, with as small mouths as can be had, so as to preclude the steam from getting out, or the air or water within, by tying cloths over them, and putting on plates or small waiters, with weight thereon: then set the jar or jars into a large pot or kettle, with water up to their necks, and by no means let any get into their mouths, boil it slowly, until the leaves are completely wilted: take the jar or jars out and set them away, with their covers securely on, until they and their contents are perfectly cool: take out the leaves, with their liquid substance (if any,) and put the whole together in equal quantities, into large dishes, to dry in the shade as before recited (say on tables in a room as clear of wind or air as possible,) often stirring the leaves, that they may absorb the liquid (if any) and dry with expedition: when thoroughly done, should be immediately canistered up, and is then fit for use.

The writer of this article has, for some years past, successfully cultivated and cured in this country the above plant from seed which he himself obtained from the East Indies; and there is not the least doubt but that it will prosper and do well in any part of the United States, as the seed which falls from the plant or otherwise will stand the winter of this climate, and come up in the spring; but the most advisable way is to gather the seed in the fall, and sow them in the spring, in small drills, of good fine earth, about two feet wide; from which you can draw out in a wet season, and transplant as other plants, as soon as three leaves appear on the plant, leaving and depositing them about eight inches apart, and cultivating them with a hoe, as you would cotton or indigo, which had better be done in the evening, when the heat of the day is over. Three gatherings may be had in a season—the first is the best.

A wisp of straw should be placed in the bottom of the pot or kettle, to set the jars on, when boiled.

*I am aware, that were the turf to be raised to a given height, in a given length of mould-board, and not to be turned over, the form of least resistance would not be rigorously a wedge with both faces straight, but with the upper one curved, according to the laws of the solid of least resistance described by the mathematicians. But the difference between the effect of the curved and of the plain wedge, in the case of a mould-board, is so minute, and the difficulty in the execution which the former would superinduce on common workmen, is so great, that the plain wedge is the most eligible to be assumed in practice of the first element of our construction.

From the Massachusetts Agricultural Repository.
ON RAISING THE OAK FROM THE ACORN,
AND THE BEST MODE OF DOING IT.

[BY THE EDITORS.]

It is very extraordinary, that, notwithstanding the Massachusetts Agricultural Society has for thirty years offered great premiums for the culture of the oak in plantations, and especially since the legislature enjoined it upon the several agricultural societies throughout the state to offer premiums for the raising of forest trees, but two claims should have been made. We can only account for it on one of the following grounds, either that the premium has not attracted the attention of our farmers, or that they have not sufficient spirit and enterprise, or that they are averse from any new culture, however important and reasonable. We shall take the article of White Oaks, which were selected by our society, as being the most valuable timber of the Northern States.

The premium offered in 1822, for one acre planted with white oaks, and found to be in the best state in September 1823, (that is at eighteen months old,) was 100 dollars per acre. The expense of raising seedlings of eighteen months old would not exceed twenty dollars more, if the following account be correct; indeed we believe it would not exceed ten dollars, as we can see no reason why the expense of planting an acre of acorns should exceed the expense of planting an acre of corn. There would be left then of clear profit to the raiser of an acre of oaks a profit of sixty dollars at least for two years culture, and as is remarked in the following article, a crop of grain may be raised at the same time sufficient to pay the whole expense. Have we no man in the state who is spirited enough to set the example, and carry away the honor and profit? The acre of oaks will *afterwards be his*, and there is no mode in which he could employ his land to so great advantage. It will not surely be said, that our farmers cannot spare any of their land, when our great error consists in holding more than we can, or do cultivate well.

On the mode of raising the Oak from Hunter's Notes on Evelyn's Sylva.

"Having the ground properly prepared, (by breaking it up and reducing it to a fine tilth, either by potatoes or repeated ploughings) and having a sufficient quantity of acorns, all gathered from the most vigorous, healthy, and thriving trees, proceed to the setting them in the following manner. In the month of February or March [but in this country we say from experience, the months of November or December if the latter month be open,] let lines be drawn across the ground for the rows, at the distance of four feet from each other; but if this be thought too great an interval, the rows may be made three feet, in which case the acorns must be put down at a greater distance from each other. Then having sticks properly rounded to make the holes, (a common dibble) plant the acorns in the rows at ten inches asunder. Let them be put down about two inches below the surface, and see that the earth be properly closed upon them to prevent mice or crows from injuring the seed. In some places it is customary to sow acorns after the plough in furrows, but where the ground happens to be stiff, great care should be taken not to cover the seed with too thick a furrow.

"The first year after planting the acorns, the weeds must be kept down by hoeing and hand-weeding, and this must be done early in the spring before the weeds get so strong as to hide the tender plants, which would occasion many of them to be destroyed in cleaning. It is also the cheapest as well as neatest husbandry to take weeds down, before they grow too large; for though the ground may require an additional hoeing in spring, yet the weeds being hoed down when young, a man may hoe over a great quantity of ground in a day. Weeds cut in their tender state immediately die. Whereas, when they are old and strong, they frequently grow again, especially if rain falls soon after, they perfect their seeds in a short time, and thereby injure the whole plantation.

"The second year of their growth the common plough may be made use of, to cultivate and keep the ground clean, [or potatoes might be raised between the rows if proper care be taken not to trample on the plants.—Editors.]

As these acorns sometimes fail, the author proposes a nursery in the same field to supply the deficiencies.

"Having then given directions for the raising of wood, I proceed," says the author, "to their future management. And first, the rows being four feet asunder, and the plants two feet apart in the rows, they may stand in this manner for twelve or fourteen years, when every second plant may be taken out and sold for hoops or poles. After every second plant is taken away, let the roots of those taken away be grubbed up to give the remaining plants more room freely to extend their roots. The plants being now four feet apart each way, they will require no more thinning for seven or eight years, that is, till they are twenty years old, when the healthiest and most thriving trees must be marked to stand for timber, and the others cut down for poles, and their roots left to produce future underwood.

"The oak will grow and thrive on almost any soil, if properly planted, though it cannot be supposed that their success will be equal in all places. A rich, deep, loamy soil is what oaks most delight in, though they will grow exceedingly well in clays of all kinds, and in sandy soils, in which last, the *finest grained timber is produced*."

The author then proceeds to inquire, which of the different modes of raising oaks produces the best timber, from the acorn, the seed-bed, or the nursery. Mr. Evelyn decides in favor of planting the acorn, and Mr. Hunter adds, that whoever will look at the woods which were sown, and compare them with those which were planted from nurseries, will not hesitate a moment to declare in favor of Evelyn's opinion.

What are the obstacles to our following this excellent example of the great farmers of England, in the age in which our ancestors emigrated? Is it because we are too impatient, and unwilling to await so tardy a return? Yet there are constant pleasures in the annual growth of our forests; they seem to be the work of our own hands, at least of our own providence and care; they are subject to fewer hazards, and their profit is certainly greater than that of any other employment of capital on land, or is this aversion to planting the effect of an hereditary prejudice against trees? Our ancestors found their extirpation, their greatest labor, and do we

continue to feel their prejudice, when woodland is far the most valuable, and must constantly increase in its comparative value?

From the Providence Gazette.

Mes-rs. Editors—Observing in your useful paper an account of the manner of preserving peach trees from the fly in Virginia, by the application of tobacco, I am induced to send you the following, being the result of twenty years experience.

The fly makes its appearance here the first of April, resembles a wasp in size and shape, and is of a pale blue color. The whole process of the fly and worm is accurately described in the Virginia account. My remedy is to hill up the dirt from around the trees, to the height of 12 or 15 inches, and about 13 or 20 in diameter, pressing it close, to prevent its being removed by heavy rains. I removed the dirt about the 1st of August. If not removed until November, no injury will result to the trees; any substance impervious to the fly will answer the purpose as well as tobacco or dirt. OLD WARWICK.

From the Dartmouth (N. H.) Herald.

KEEPING HORSES.

Every gentleman, who is obliged by his health or his business to keep a horse, complains of the enormous expense incurred by it. If allowed to eat and waste as much as he chooses, a horse will consume from four to five tons of hay in a year, besides the necessary grain. But it is ascertained from actual experiment, that ten pounds of good hay, with two quarts of corn a day, are enough to keep a common horse in fine order. Ten pounds of hay a day are 3650 pounds, little more than a ton and a half a year—and two quarts of corn per day are about twenty three bushels a year. Call hay seven dollars a ton and corn four shillings a bushel, and you make the annual expense of feeding a horse twenty six or seven dollars, about half as much as it commonly costs.

To keep a horse in the cheapest and healthiest manner, let him stand on green turf, dug up pretty thick, and placed on the floor of his stable—let him be carefully and faithfully curried every day. This is of more importance than is sometimes imagined. It opens the pores and preserves a healthful state of the skin, on which, in horses as in men, depends, as much as on almost any thing else, the proper and healthy operation of the various animal functions.

Although the inferior animals are not, like men, subject to unnatural appetites on account of unnatural stimulants received into the stomach, they unquestionably often consume more food than is necessary to maintain their vigor and spirit. This surplus it is economy to ascertain and retrench.

Corn is cheaper than oats for horses, because there is more heart in a quantity of the same price. It is better to be given two or three times a day in small messes—and to be given dry that the mastication of it may keep the mouth in a healthy state.

To measure hay the tare of a basket may be taken, and the hay given from it in small quantities through the day, but chiefly at night.

A horse that is not used should be fed with corn but sparingly. It should be occasionally salted.

is not perhaps generally considered, that horses are subject to colds and fevers as really men. They should therefore be used with at tenderness and delicacy, and often washed cold water. The pulse generally indicates health of a horse. It may be felt about an inch back of the eye, and in health beats about strokes in a minute.

The great secret in making horses look well is to do well is attention to them. Men who above looking to their horses, will seldom have good ones.

In using horses it is better to drive briskly and stop often than to drive even slowly by long ges.

NEW ENGLAND FARMER.

SAURDAY, JULY 19, 1823.

Farmer's and Gardener's Remembrance.

JULY.

HARVEST.—Much has been said and written about the proper time to harvest wheat. It is now generally agreed that it is better to cut wheat rather before it is ripe, and not wait till the whole becomes uniformly yellow. A writer in the Memoirs of the Board of Agriculture of the State of New York, observes that "a great deal of waste attends wheat, when it is permitted to become ripe before it is cut; in cutting, binding, pitching, loading, and carrying home, some will shell out; and it is a very common thing a fortnight after harvest, to see a field as thickly covered with young plants as if it had been sown over again; in this manner a couple of bushels to the acre are lost, without taking into the account that which has not sprouted, by cradling it a little before it is ripe, if the grain is not quite as plump, which generally it would be, at least it is compensated by saving that part of it which would have been wasted. It is got in in much cleaner condition, and the straw is in a better situation either for use or other purposes. It should be left as long as cradled twenty-four or forty-eight hours, according to the weather, as being more exposed to the sun and air, it will cure more perfectly than if immediately put into sheaves. This is very essential to be observed, for when put by in a damp situation, mouldiness is sure to take place, and it is diminished in value both for sale and for use."

Some recommend to make the bands for wheat in the morning early, while the dew renders the straw pliable, which may be well when the grain has been suffered to stand till it has become very ripe. It may likewise be well to bind your sheaves, when the straw is brittle, towards evening, as a small degree of moisture will not only make the straw tougher, but in some degree prevent the shelling of the grain.

When wheat or rye is blasted or mildewed it should be cut immediately, though still in the milk. It may lie on the ground till the straw is sufficiently dried, and the grain is in some degree hardened. But care should be taken that it be spread thin. Dr. Deane observed that "the heads should lie so as not to touch the ground; which may be easily done if the reapers will only take care to lay the top end of each handful on the lower end of the preceding one."

Rye may be reaped as soon as the straw is all turned, except at the joints, and immediately

below the ear has become so dry that no sap can be forced out by twisting it; and the kernel has become so hard that you cannot well break or mash it between your thumb and finger.

"Wheat and other grain that is lodged, may, and ought to be cut the earlier; for after the straw is broken or corrupted, it conveys no nourishment to the grain, or as bad as none."

"The ancients reaped their corn, as Pliny says before it was fully ripe. And it is certain that great inconveniences arise from letting some sorts of grain stand till they come to their utmost maturity. The chaff and straw are the worse for fodder. And if such corn chance to take wet in harvesting it suffers more for being very ripe. But grain cut in a greener state will bear a good deal of wet without damage."* But if wheat be intended for seed (as we shall show hereafter) it should not be cut till quite ripe.

LOOK TO YOUR GARDENS, NURSERIES, ORCHARDS, &c.—We are not a little apprehensive that in consequence of the hurry of hay time and harvest your garden, orchard, &c. have not commanded a sufficient share of your attention. In order to destroy wasps, ants, &c. you should hang up, or place glass phials, filled with honey or sugar water in such parts of your premises as are most exposed and most liable to their depredations. But these contrivances for destroying insects should be made use of before the fruit begins to ripen, otherwise the plunderers will prefer the fruit to your bait, and shun the road to their ruin. Hoe the ground about your fruit trees, flowering shrubs, &c. of all descriptions, that the weeds may not rob them of the nutriment which they would otherwise derive from the earth. Cut off all suckers and sprouts which spring from the roots of the trees. "Pick off all punctured and decaying fruit, and give them to hogs; also such as have fallen in that state from the trees; for the worms that are in these fruits, which have been the cause of their decline, will soon arrive at their maturity or winged state, and attack the remaining fruit."† Or where it can be done without injury to any crop it would be of use to turn pigs into an orchard, to eat the fallen and decayed fruit, and thus destroy the insects contained in such fruit. If any of the branches of any species of fruit tree appear to be overloaded with fruit, they should be not only propped up, so as to prevent their being broken down, but it will often be found advisable to pick off by hand a part of the fruit, in order to give more room for the remainder. This process is more particularly necessary for peach and nectarine trees, in favorable seasons, but sometimes will be serviceable for apple trees, especially such as are young. Some people will consider this a very disagreeable task, both on account of casting away so much fruit, which they might think would do very well, and also on account of the time spent in performing the work; but this is a mistake, as the loss in number will be more than repaid by the size, flavor, and excellence of the remaining part; and besides, the trees will be preserved in health and vigor for the production of future crops."‡

When trees are suffered to bear a superabundant crop, the extraordinary efforts made to support their too numerous offspring, often so

exhaust them as to bring on diseases of which they frequently do not recover for at least two or three years; and sometimes always remain weakly and stunted.

COLLECTING SEEDS.—Great improvements may be made by selecting seeds from the earliest, most vigorous and thrifty plants. Even wheat for seed has been picked from the field by such single heads as were most forward, vigorous, large, and filled with the most plump and sound berry; and in that way a gradual improvement of the kind may be introduced. If we were about to purchase garden seeds, we should wish to be informed in what neighborhood, or fraternity of other vegetables they grew. Different sorts of plants of the same or a similar species, impart to each other their respective qualities. Thus if the genuine ruta baga grew near the common turnip, or turnip cabbage, the seeds of the former will have in part the peculiarities of the latter, and *vice versa*. If a mangel wurzel root, intended for seed, has grown near a plant of the common kind of beet which has likewise gone to seed, the seeds of each plant will partake in some degree of the qualities of the other. You should never save seeds from such water-melons, musk-melons, squashes, cucumbers, pumpkins, gourds, &c. as have grown near each other, unless in your crop from such seeds you would like to have melons which have somewhat of the flavor of squashes, cucumbers which taste a little like pumpkins, and pumpkins not much sweeter than gourds. There can be no cross between a cabbage and a carrot; but there can be between a cabbage and a turnip; between a cabbage and a cauliflower nothing is more common, and the different kinds of cabbages will produce crosses presenting twenty, and perhaps a thousand degrees, from the Early York to the Savoy. Turnips will mix with radishes and ruta baga; all these with rape; the result will mix with cabbages and cauliflowers; so that if nothing were done to preserve plants true to their kind, our gardens would soon present us with little besides mere herbage. To save the seed of two sorts of any tribe, in the same garden in the same year ought not to be attempted; and this it is that makes it difficult for any one man to raise all sorts of seeds good and true.*

Seeds should stand till quite ripe, should then be gathered when dry. If when threshed or shelled any moisture remains attached to them they should be dried in the sun, or near a fire. They are best kept in a room where there is occasionally at least, a fire in the winter. They are most securely kept in the pods or on the stalks, but this is sometimes inconvenient and often impracticable, unless it be for such as are very valuable, very curious, and lie in a small compass. Mr. Cobbett says that great care is necessary to avoid the use of unripe seed.—"Even in hot weather, when the seed would drop out, if the plants were left standing, pull, or cut the plants, and lay them on a cloth in the sun, till the seed be all ready to fall out; for, if forced from the pod, the seed is never so good. Seeds will grow if gathered when they are green as grass, and afterwards dried in the sun; but they do not produce plants like those coming from ripe seed. I tried some years ago, fifty grains of wheat, gathered green,

* Geographical Dictionary.

† McMahon.

‡ Ibid.

* American Gardener.

against fifty gathered ripe. Not only were the plants of the former feeble, when compared with the latter; not only was the produce of the former two thirds less than the latter; but even the quality of the grain was not half so good. Many of the ears had smut, which was not the case with those that came from the ripened seed, though the land and the cultivation were, in both cases, the same.* Other writers advise not to reap wheat infected with smut till fully ripe, and perfectly dry, and according to Mr. C. wheat intended for seed should in all cases be allowed to become quite ripe before it is reaped.

A writer whose observations are quoted with approbation in the "Complete Farmer," an English work of authority, says "I never thresh the sheaves which are to supply me with seed till just when I want to make use of it. I have a notion that the seed keeps better in the covering nature has given it, I mean the chaff, than it would do without it; and I am pretty certain it sprouts sooner in the ground, the husk or bran being preserved in a tenderer and more yielding state than it would be were it exposed to the open air." If new seed is to be preferred to old, (which we believe to be the correct doctrine on this subject) wheat, rye, &c. may easily be kept in the sheaf, or at least in the chaff, and have no doubt but this will be found the most beneficial mode of preserving it.

WEEDS MADE USEFUL.—There are some vegetable productions, which we denominate weeds, such as purslane, pigweed, brakes, &c. which make good food for swine, and should be gathered and given to them whether they are kept in pastures or pens. Even when pigs are suffered to run in highways, (a practice by no means to be justified, but sometimes tolerated) it is best to give them every green thing which they will devour. The suckers of corn they will receive with thanks expressed in their dialect. But if weeds have so far arrived to maturity that their seeds would grow if they had a chance, you will do best to burn them with fire or quick lime, or to bury them in a compost heap, where they will be apt to lose their germinating principle by fermentation. Sometimes it will be found expedient to bury them near the spots where they grow, between the rows of your cabbages, corn, &c. and they will furnish food for growing crops, or enrich the soil for the benefit of your future husbandry. Every thing which has grown, even if it be a thistle, a briar, or any thing else noxious or cumbersome, may serve as food for some useful product of the earth. The only question is whether it will cost more to save it for manure than it will be worth when saved. But it should be a general rule to let no vegetable nor animal substance wither or putrefy above ground. Bury your weeds then as you sever them from the soil by hoeing if convenient, and if even a mouse dies on your premises, honor his remains with at least one shovel full of earth; and thus enrich your soil, and save the atmosphere from unwholesome effluvia. When you have dug potatoes for family use, bury the tops under earth enough to absorb the products which arise during their decomposition, and make some allowance for some part of the soil's being washed away by the next shower. And when the vines of your peas, beans, squashes, water me-

lons, &c. &c. have done bearing, please not to leave them cumbering your premises, rotting above ground, nor harboring insects, but bury them in your compost bed, your barn yard, or dig trenches where they grew in which they may be deposited, and let them manure the earth instead of the atmosphere.

GATHER HERBS FOR DRYING, DISTILLING, &c.—Herbs, such as mint, balm, penny-royal, sweet marjoram, hyssop, sage, spear-mint, pepper-mint, tansy, wormwood, lavender, marygold, camomile, &c. should be gathered about this time in order for distilling, and for family use. They should be cut in a dry day, when they are in the highest perfection, nearly of full growth and in full bloom, and spread to dry in a shady place. When sufficiently dried they may be put up in paper bags ready for use.

We think ourselves greatly honored by the following official testimony in favor of the manner in which the New England Farmer has been conducted; and our highest ambition will be to continue to deserve the approbation of a body so competent to appreciate the value of our unremitted efforts to merit encouragement from the agricultural part of the community. We are not only pleased with, but proud of, our present employment, and when adequate judges inform us that our labors are "highly useful to the farming interest," we receive a reward, which is more grateful to us than would be the "boast of heraldry, the pomp of power," or all that wealth can bestow. We are fully of opinion with Mr. LOWELL, (as expressed in the editorial remarks of the last No. of the Massachusetts Agricultural Journal) that agriculture is not only "one of the most but indeed the most important branch of human industry." If, then, we can promote the interests of agriculture by our humble efforts, we cannot aspire to any higher honor, and our ambition cannot form a wish which will not be completely gratified.

At a meeting of the Board of Trustees of the Massachusetts Society for promoting Agriculture, held July 12, 1823—

VOTED, That in the opinion of this Board, the weekly paper entitled the "NEW ENGLAND FARMER," from the able manner in which it is conducted, is calculated to be highly useful to the farming interest, and deserving of more extensive patronage than it has hitherto received; we therefore cheerfully offer this expression of the approbation of the Board, and of a hope that there will be found a willingness in the public to increase the subscription so far as to enable the publisher to continue his paper, and thus secure permanently to farmers, this valuable vehicle of agricultural information, which we think the best of the kind with which we are acquainted.

A copy from the record,

BENJ. GUILD, Assistant Rec. Sec.

JERUSALEM ARTICHOKE.

The observations of Mr. McKean, in the article which commences this day's paper, cannot fail to suggest important ideas to every person, who is concerned or feels an interest in the

pursuits of agriculture. We have attempted to procure information relative to a plant which we have been in the habit of considering to little better than the most worthless weed that annoys the cultivator. The result of our inquiries is that the Jerusalem Artichoke is called by botanists *Helianthus Tuberosus*, and is of the same genus with the Sunflower. Dr. Darwin informs us, (Phytologia, sec. xvi.) that "horses are fond of the leaves, and swine of the roots, both of which are produced in great quantities, and as the latter contain much sugar, they must be nutritive; and in respect to their culinary use are remarkably grateful to most palates, as well as nutritive, when cut into slices, and baked in beef or mutton pies; but are said to be flatulent in the bowels of those whose digestion is not very powerful; a property, which might be worth attention, where the propensity to fermentation is required, as in making bread with potatoes, or in the distillery."

A writer for the Bath Society Papers, vol. i. page 278, with the signature N. Bartley, says "At a considerable expense and trouble, I procured of these roots sufficient to plant half an acre of ground; but I have them now in great plenty; I find the produce to be about four hundred and eighty Winchester bushels to the acre; and I think they are about equal in value to potatoes for feeding store pigs, such as are not less than five or six months old. For fattening hogs I do not find they are near so valuable as potatoes. But their chief recommendations are the certainty of the crop, that they flourish in almost any soil, and do not require any manure at least for such a produce as I have stated.—They are proof against the severest frost, and may be taken out of the ground as occasion may serve; whereas potatoes are soon affected with frost, and must therefore be secured before winter sets in. I generally plant three or four acres in a season."

The writer planted his artichokes, in England, in the beginning of March, in drills three feet and an half asunder, and the sets or cuttings nine inches apart in the rows.

The Farmer's Assistant recommends boiling these roots for feeding swine, and says they will grow well in almost any dry soil, even if it be poor. When cut and ground in a cider mill, they make good food for horses, with the addition of a little salt. Mr. Legaux, of Springmill, Pennsylvania, raises this root from Dutch seed, and has them eight or nine inches in diameter. He says they are easily kept through winter in the ground, nothing being requisite further than to dig a trench round them to prevent the water from injuring them.

We have conversed with practical farmers on the subject of cultivating the artichoke, and have always found them opposed to it, principally on account of the difficulty of clearing the ground of this root. They say that there is no

* American Gardener.

d so difficult to subdue, and if it once gets possession of a piece of ground it maintains its monopoly in defence of all ordinary methods of cultivation. But if the industry of hogs is all that is wanted, as Mr. McKean informs us, there is nothing to be apprehended on that score. If we will "grow to some perfection in woodlands," on a soil which would produce little or nothing else of value, it might render millions of acres in the United States productive, which are nearly or quite useless. It would cost nothing for seed after the first year, and afford considerable product, with no labor, except that of gathering it. It is, moreover, a species of the Helianthus, or Sunflower, which we are told produces, by the perspiration of its leaves, much greater quantities of oxygen gas, or vital air, than any other vegetable. It may thus promote health as well as furnish subsistence. Perhaps, too, its leaves and stalks may be worth something as ingredients in compost beds, or to sow over the farmers' yard in the autumn.

FOREIGN.

LATEST FROM EUROPE.

By an arrival at New York, from Liverpool, London papers have been received to the 2d, and Liverpool papers to the 3d of June. Paris dates were received by the same arrival to the 30th of May. It is very probable that Madrid was occupied by the French on the 23d of May, and a regency was established on the day following. Count Abisbal, the constitutional General of the army of Madrid, has fled to the enemy. That officer, in a letter to the French commander, stated that he is of opinion that the majority of the nation is not solicitous to continue the constitution of the year 1812. He advises the French to dismiss his ministers and appoint others who would do no party, and who would deserve the confidence of all Spaniards, as well as of all Foreigners.

The London Courier of the 28th May says, "We are assured that Ministers consider the intelligence yesterday received from Spain, as decisive with regard to the war. The proceeding of Count Abisbal to lead to such arrangements as will speedily put an end to hostilities. He despatched copies of his answer to Montijo, to Mina, Ballasteros, and Morillo, and it is not doubted they would act in concert with him. Abisbal's army did not exceed four thousand men, and prudently marched them from Madrid, fearful of the consequences that would likely ensue, had they remained in the capital when the French troops entered it."

The London Sun of the 31st May states that negotiations between France and the new Spanish Ministers are now in progress, and that the whole has been arranged with the full knowledge and sanction of the British government. Many of the Cortes have absented themselves with the understanding that they are not to be molested when the new order of affairs is established. Austria has assembled no army, and together with Prussia and Russia has resolved to adopt a policy entirely neutral. The terms offered by France to Spain, they say, are such as will be satisfactory to the people in general.

There is a great deal more of guess work in these reports not worth republishing. All we can learn is that the Spaniards are about to submit to such an order of things as their dictators think proper to prescribe.

The Greeks.—It is said that arrangements have been effected, through the British Minister at Constantinople, by which Greece is to be declared free, on condition of paying to the Porte annual tribute equal to the revenue which the Porte formerly derived from Greece.

Ireland.—The last accounts from that unhappy country represent the state of society as worse than the

savage. Anarchy, pillage and murder are predominant throughout the Kingdom, and law and social order have ceased to control the passions, or regulate the conduct of the great mass of the population.

Progress of Revolution in South America.—The province of Guadalupe, in Mexico, has declared itself free and independent of the other provinces of America, in a proclamation of 22 articles. She will hold no relations, except exterior ones, with the other provinces, and recognise nothing which the deputies in the present Congress may do contrary to this. It is proposed to establish a perpetual Congress at Queretaro, to raise an army, build a navy, &c.

The New York American says, "We learn on the authority of a Colombian gentleman in high official station, now in this city, that the Congress of that Republic, considering its own independence as firmly established, has authorized Gen. Bolivar to proceed with 4000 men to the aid of the Peruvian government, in addition to 4000 troops previously allotted to that service."

DOMESTIC.

Bunker Hill Monument Association.—At the late session of the Legislature of Massachusetts an act was passed to incorporate a company with this title. An Address setting forth the objects of this association has been prepared, and has the highly respectable signatures of Daniel Webster, William Sullivan, H. A. S. Dearborn, Wm. Tudor, Richard Sullivan, Samuel D. Harris, F. C. Gray, Samuel Swett, and Geo. Ticknor. The object of this association, as stated in this address, "is to cause to be erected a MONUMENT, which shall be consecrated to the great leading characters and events, both civil and military, of the American Revolution, up to the 17th of June, 1775, to bear appropriate descriptions, names and dates." It is added that "as soon as arrangements can be concerted, appeals will be made through committees to individuals. All will have an opportunity of contributing as their ability or inclination may prompt. The smallest donations will be gladly received, and the humblest citizen may have an opportunity of saying that he has contributed something to testify his respect for the labors and sufferings of his ancestors. An exact account of all subscriptions will be kept; those of each town entered separately, and the name of each donor recorded in a permanent volume, to be deposited and preserved in the monument."

Robbery of the Mail.—On the morning of the 7th inst. about 2 o'clock, the mail stage from Philadelphia to Baltimore, was robbed about 16 miles from the last mentioned city. A rail fence had been thrown across the road by the robbers, which stopped the stage. Three men advanced, at whom the guard discharged his blunderbuss and two pistols. Although some of the shot took effect, the robbers knocked down the guard, and compelled the driver to flight. The guard was held in derision by one of the robbers, while the others rifled the mail, and the whole retreated. The alarm having been given by the driver, a party proceeded to the place where the crime was perpetrated, a shirt was found, which it was ascertained belonged to one of the laborers who worked at a forge in the vicinity, and it was found that the robbers were workmen, whose names were Ward, Emmenheiser, and Moore. The latter confessed the crime, and they were all committed for trial.

Windows.—The Baltimore Morning Chronicle, in noticing the recent death of a child by a window sash falling on its neck, has some remarks respecting the manner of their construction, which it considers unsafe, and recommends windows to open like folding doors, as preferable both for ornament and safety. This improved mode of making windows, we are informed, has been adopted in many of the large cities of Europe, and travellers who have returned from their tours in that country are so convinced of the superiority of construction in the manner of folding doors that they are surprised not to find them adopted in this country, where the useful arts are in such a high state of improvement.

The constituents of Mr. McDuffie, of South Carolina, have recently given him a dinner, at which he made a long speech.

AGRICULTURAL PREMIUM, FOR THE BEST MANAGED FARM.

At a meeting of the Board of Trustees of the Massachusetts Society for promoting Agriculture, held at the President's, 12th July, 1823, it was

Voted, That this Society will grant as a premium to the owner of the best cultivated farm within the precincts of the several Agricultural Societies of the State, the sum of Thirty Dollars each, in addition to the premium which may have been awarded the claimant by the local Society; and that it will accept, as full evidence of the merit of the claimant, a certificate signed by the President of the local Society, certifying that such person was declared by the Society or their Trustees, entitled to the premium within that district;—that the applicant shall, however, in all cases, be held to exhibit to this Society, a statement of the extent of his farm; the state and plan of his farming buildings; his mode of collecting and managing manure; the number of domestic animals usually supported thereon; the quantity and quality of land under cultivation, and his usual mode of culture, as well as the average amount of his crops, of all sorts.

THE HAPPY MAN.—*Translated from Horace.*

Happy the man, who free from care,
Manures his own paternal fields,
Content, as his wise fathers were,
To enjoy the crop his labor yields.

Nor usury torments his breast,
That barter happiness for gain,
Nor war's alarms disturb his rest,
Nor hazards of the faithless main:

Nor at the ever wrangling bar,
With costly noise and dear debate,
Proclaims an everlasting war,
Nor fawns on bad men basely great.

But for the vine selects a spouse,
Chaste emblem of the marriage bed,
Or prunes the too luxuriant boughs,
And grafts more fruitful in their stead:

Or views the lowing herds, that share
The produce of his fertile plains,
And ponders with delightful care,
The prospect of his future gains:

Or shears his sheep which round him graze,
And droop beneath their curling loads,
Or plunders his laborious bees
Of balmy nectar, meet for gods.

When autumn comes to crown the year,
And bending boughs reward his pains,
Joyous he plucks the luscious pear,
The purple grape his finger stains.

Each honest heart's a welcome guest,
With tempting fruits his table glows,
And still the Almighty Donor's best,
For what his Providence bestows.

LIGHTNING RODS.

The first object of the rod (says Dr. Franklin) is to prevent a discharge of electricity from the cloud—to effect this object, the rod should be well elevated, and terminate in a slim sharp point. Dr. Franklin's experiments as well as others, prove that the power of the pointed rod extends quite to the clouds, and takes from them a vast quantity of the fluid before they arrive within the striking distance. From the rod which he erected on his own house, he led a small wire into one of the rooms in the house; on the end of the wire was fixed a small bell, and at six or eight inches distance from the bell was placed another; from this bell a wire was led into the cellar and fixed to the pump rod; between the two bells, a brass ball was suspended by a silk thread; when a thunder cloud appeared over the house, the bells would be electrified, and the brass ball would be attracted and repelled alternately, at play quickly between the bells, and keep up a continual ringing till the cloud had passed over the house. At one time he was awakened by an unusual noise—he immediately sprang out of bed to ascertain the cause: and on opening the door he perceived the quantity of fluid that was passing down was unusually great; the brass ball was removed at a distance from the bells, and an uninterrupted column of fluid was passing from one bell to the other. This circumstance is sufficient to prove that the pointed rod will prevent, or at least, lessen the discharge from the clouds; a dull or blunt point will have little or no effect; therefore, pains ought to be taken to have it in its proper shape.

The second object of the rod is to receive and conduct the electrical fluid into the earth, when the point is insufficient to prevent a discharge from the cloud; to effect this object, the conducting power of the rod should be made as great as possible, by having the rod communicate with some conducting substance, such as water, or very moist earth. Franklin says, the rod should be settled, at least, six feet below the surface of the ground. Some have recommended putting a large quantity of charcoal at the bottom of the rod, and have it extend some distance from it; this may have a good effect, for charcoal is a perfect conductor of electricity. The conductor ought to be three fourths of an inch in diameter; rods of iron but little smaller than this have been known to be completely dissipated at one stroke of lightning.—The rod ought to pass in the most direct course possible, for the conducting power of a rod or wire is always weakened by increasing its length, and the fluid will follow a short conductor in preference to a long one, in all cases. It ought to be supported by wood, and not suffered to come in contact with any metallic substance, such as staples, or nails of iron, brass or any other metal.—*Providence Journal.*

There is sense in the following extract at least; whether it be common sense or not, we will not pretend to decide:

SENSE.—There are a great many gradations of wisdom among people—there is good sense, great sense, and fine and high sense, besides no sense and little sense; but the best kind of sense in my estimation, is that which is vulgarly denominated *common sense*. Your good sense is always running away with itself; your great sense is sure to have mischief at the bottom of it; your fine sense makes broken hearts; your high sense broken heads; your no sense goes blundering to the devil often, and your little sense is not much better—but common sense fills a man's purse with dollars, his cellar with beef and pork, and his peaceful fire-side with a good wife and good children. Common sense is best.

From the Nantucket Inquirer.

"SHEARING."

The annual *Shearing* took place on Monday and Tuesday last. Our distant readers may possibly smile at this annunciation of an event apparently so unimportant. But when we assure them that this is almost the only jubilee which we islanders allow ourselves to celebrate in any sort of style, they may offset this account against the innumerable details of *Election festivals*, *Fourth-of-July parades*, *Tammany dinners*, *Christmas treats*, *Linnean coronations*, *Krout feasts*, and *Horse Races*, at which we are ever and anon compelled to expand our optics and smack our lips in envious wonderment.

There are about 10,000 Sheep kept on this island, which it had hitherto been customary to shear in two separate flocks, east and west of the town. The sheep owners the present year, however, resolved on a general shearing; and for this purpose an area of 300 acres was inclosed, about three miles south of the town, into which the sheep, collected from all quarters of the island, were driven. In the centre of this field, a large circular pen was formed, bordered on its exterior by the private pens of

each sheep owner, where the sheep were severally shorn.

Whatever may be the opinions of our transmarine readers, the vast flock thus concentrated together with the multitude employed in shearing, and gathered to witness the operation, presented no contemptible spectacle. If the exhibition was not in itself calculated, equally with any military display, to inspire ideas of national independence, it at least imbued the beholder with some notion of domestic comfort, and carried his mind back to the sylvan simplicity of the patriarchal ages.

On the spot a number of large tents were erected, through which the voice of festivity resounded. We have not been furnished with any formal order of the rites therein performed, but the following may be imagined to have been among the "toasts drank on the occasion."

The festival we celebrate—May our political and ecclesiastical shepherds be as careful to shear too close.

Commerce—The golden fleece of the nation—*Agriculture and Manufactures*—May they flourish by hook or by crook.

National Independence—May it prosper more by industry than gunpowder.

Our Legislators—May their tongues never like lamb's tails, wag, wag, wag.

The Krout Club—Cabbage heads and Mutt heads; may a sufficiency of pluck attend both.

The Fair Sex—When our beaux cast sheep eyes towards them, may they become warm wool.

FORTY YEARS AGO—

Literature meant learning, and was supported by common sense. Refined nonsense had advocates, and was pretty generally kicked out of doors.

Forty years ago—men of property could lab and wear homespun to church. Women could spin and weave, make butter and cheese, while husbands were worth thousands.

Forty years ago—there were but few mechanics in the country—few insolvent debtors and very rarely imprisoned for debt.

Forty years ago—the young ladies of the first respectability learned music, but it was the humming of the wheel, and learned the necessary steps of dancing in following it. The forte piano was a loom, their parasol was broom, and their novels the bible.

Forty years ago—the young gentlemen ho corn, chopped wood at the door, and went to school in the winter to learn reading, writing and arithmetic.

Forty years ago—there was no such thing as balls in the summer, and but few in the winter except snow balls; and

Forty years ago—if a mechanic promised to do your work, you might depend on his word the thing would be done.

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but the who pay within sixty days from the time of subscription will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the Publisher) until arrearages are paid.

Agents who procure seven subscribers, and become responsible for the payment will be entitled to copy gratis, and in the same proportion for a larger number.

BOSTON, SATURDAY, JULY 26, 1823.

No. 52.

[From Elkington on Draining.]

AN ACCOUNT OF THE MOST APPROVED MODE OF DRAINING LAND, &c. &c.

In the year 1763 Mr. Elkington was left, by his father, the possession of a farm, called Princethorpe, in the parish of Stutton upon Donsmore, and county of Warwick. The soil of this farm was very poor, and in many places extremely wet, that it had been the cause of rotting several hundred sheep; which was the first circumstance that determined him, if possible, to drain it; which he began to do in 1761.* The field in which he began, was of a wet clay soil, rendered almost a swamp (and, indeed, in some places, a *shaking bog*;) by the springs issuing from a bank of gravel and sand adjoining it, and overflowing the surface of the clay. In order to drain this field, he cut a trench about four or five feet deep, a little below the upper side of the bog, or where the wetness began to make its appearance; and after proceeding with it so far in this direction, and at this depth, he found it did not reach the *main body of sub-jacent water*, from whence the evil proceeded. On discovering this, Mr. Elkington was at a loss how to proceed. At this time, while he was considering what was next to be done, one of his servants accidentally came to the field where the drain was making, with an iron crow, or bar, which the farmers in that county use in making holes for fixing their sheep hurdles.—Mr. Elkington, having a suspicion that this drain was not deep enough, and being desirous of knowing what kind of strata lay under the bottom of it, took the iron bar from the servant and after having forced it down about four feet below the bottom of the trench, on pulling it out, to his astonishment, a great quantity of water burst up through the hole he had thus made, and ran down the drain. This at once led him to the knowledge of wetness being often produced by water confined farther below the surface of the ground than it was possible for the usual depth of drains to reach, and induced him to think of applying an auger, as a proper instrument in such cases.

Thus did the discovery originate from chance, the parent of many other useful arts! Fortunate it is for society, when such accidents happen to persons who have sense and judgment to avail themselves of the hints thus fortuitously given! In this manner, he not only accomplished the drainage of this field, which soon rendered it completely sound, but likewise all the other wet ground on his farm.

The success of this experiment soon extended Mr. Elkington's fame, in the knowledge of draining, from one part of the country to another; and after having drained several farms in his neighborhood, with equal success, he at last came to be very generally employed; has been since, and is now (1797,) engaged in various parts of the kingdom, which shall be more particularly noticed in the sequel. It is, indeed, now, impossible for him to execute half the

employment he has in hand, or to accept the numerous offers that are every day made to him. From his long practice and experience, he is now so successful in the works which he undertakes, and also in judging of the internal strata of the earth, and nature of springs, that he can, with remarkable precision, judge where to find water, and where to trace the course of springs that make no appearance on the surface of the ground. The rules on which he acts, with regard to these discoveries, will be afterwards explained, in treating of the nature of wet grounds caused by springs.

Lastly—Within these few years past, since his practice has been so widely extended, and so generally successful, he has drained, in various parts of England, particularly in the middle counties, many thousand acres of land; which, from being originally of little or no value, is now as productive as any in the kingdom, capable of producing the most valuable kinds of grain, or of feeding the best and healthiest species of stock.

Some persons have erroneously entertained an idea, that Mr. Elkington's sole skill lies in applying the auger for the *tapping of springs*, without attaching any merit to his method of conducting the drains. The accidental circumstance above stated, gave him the first notion of using an auger, and directed his attention to the practice of draining; in the course of which he has made various useful discoveries, which are afterwards more fully explained. It will be sufficient here to remark, that draining, according to his principles, depends upon three points. 1st. Upon finding out the *main spring*, or cause of the mischief; without which nothing effectual can be done. 2d. Upon taking the level of that spring, and ascertaining its *subterraneous bearings*; a measure never practised by any, till Mr. Elkington discovered the advantage to be derived from it; for if the drain is cut a yard beyond the *line of the spring*, you can never reach the water that issues from it; and, by ascertaining that line, by means of levelling, you can cut off the spring effectually, and, consequently, drain the land in the cheapest and most eligible manner. The manner in which this is done, will be afterwards described. And, 3dly, By making use of the auger to reach or *tap* the spring, when the depth of the drain is not sufficient for that purpose.

In regard to the use of the auger, though there is every reason to believe Mr. Elkington was led to employ that instrument from the accidental circumstance stated above, and did not derive it from any other channel; yet there is no doubt that others have hit upon the same idea, without being indebted for it to him. It is said, that in attempting to discover mines by means of an auger, springs have been tapped, and the adjacent wet ground thereby drained, either by letting the water down, or giving it vent to the surface. The auger has also been made use of in bringing water into wells, by boring in the bottom of them, to save the expense of digging, especially in Italy, where it is probable that the practice is very ancient. But that it has been used in draining land, before

Mr. Elkington made this discovery, no one has ventured to assert.

In Dr. Nugent's Travels through Germany, printed anno 1769, there is an account of a mode of draining land, on principles, in some respects, of a similar nature; not, indeed, by the use of the auger, but by making pits; and in a publication by Dr. James Anderson, entitled, "*Essays on Agriculture & Rural Affairs*," printed anno 1797, after describing a mode of tapping, the doctor had adopted, by sinking small pits, he adds, "I have often imagined that the expense of digging these pits might be saved, by boring a hole through this solid stratum of clay, with a winble made on purpose; but as I have never experienced this, I cannot say whether it would answer the desired end exactly."

Mr. Elkington, however, made use of the auger prior to the date of these publications, or to any hint he could possibly derive from any publication in the English language; though it is probable that, in so far as regarded *tapping of springs for wells*, the use of the auger was well known in some parts of Italy. Buffon states, "that, in the city of Modena, and four miles round, whatever part is dug, when we reach the depth of sixty-three feet, and bore five feet deeper with an auger, the water springs out with such force, that the well is filled in a very short space of time. This water flows continually, and neither diminishes nor increases by the rain or drought." Mentioning the different strata that are to be met with to this depth, he adds: "The successive beds of fenny or marshy earth and chalk, are always found in the same order, wherever we dig; and very often the auger meets with large trunks of trees, which it bores through, but which give great trouble to the workmen; bones, coals, flint, and pieces of iron, are also found."—*Buffon's Nat. History*.

ON THE PRINCIPLES OF MR. ELKINGTON'S MODE OF DRAINING.—It is remarkable, that the principles on which the draining of lands depends, being so great a desideratum in agriculture, should have been so little known or attended to; or that the practice of it, according to these obvious principles, should have been so much confined, while improvements in the other branches of husbandry have been carried almost to the highest possible perfection.

However intricate or abstruse it may hitherto have been considered, even by those who were otherwise well informed in the theory of agriculture, of which it forms the most important branch; yet it will appear, from the following observations, to be founded on circumstances the most plain and rational, and which, when reduced to practice, produce those effects which a simple knowledge of the cause naturally points out.

Wetness in land proceeds from two causes, as different in themselves as the effects which they produce.

It proceeds either from rain water stagnant on the surface, or from the water of springs issuing over, or confined under it. On clay soils, that have no natural descent, wetness is

* After the drainage of this field was completed, Mr. Elkington's flock was never afterwards affected with that disease.

commonly produced by the first of these causes, but in a variety of situations, it may proceed from the latter.* But.

The principles of Mr. Elkington's art are so closely connected with the nature of springs, that, without a knowledge of these, and the causes producing them, it is impossible to practice it either with success or advantage; for *surface draining*, where the wetness proceeds from subjacent water, is only alleviating the effect, in place of removing the cause. It will, therefore, be necessary, in the first place, so far to ascertain the nature of springs, and their connection with the formation of bogs, as to enable the practical drainer more easily to comprehend the theoretical part of Mr. Elkington's system.

From its general external appearance, and by the perforations that have been made in it by quarries, wells, and other subterraneous pits, the earth is known to be composed of various strata; which, being in their nature of opposite consistence, are distinguished by the names of *porous* and *impervious*. Those strata, which, from their more open composition, are porous, and capable of receiving the rain that falls on them, include rock, gravel, sand, and such marls as are of an absorbent quality. Clay, and a certain kind of gravel, having a proportion of clay in its composition, which, by binding and cementing the small stones together, render it equally close and tenacious as clay itself; with such rock as is of a close and compact nature, without any fissures in it, are the principal strata that most resist the reception of water, and that are capable of retaining it, on their surface, till exhaled by the sun, or carried off by suitable drains, and are termed *impervious*.

Springs, therefore, originate from rain water falling upon such porous and absorbent surfaces, and subsiding downwards, through such, till, in its passage, it meets a body of clay, or other impenetrable substance, which obstructs its farther descent; and here, forming a reservoir, or considerable collection of water, it is forced either to filtrate along such body, or rise to some part of the surface, where it oozes out in all those different appearances that are so frequently met with. This is evident from the immediate disappearance of the rain water, as it falls on some parts of the ground, while it remains stagnated on others, till carried off by evaporation; and from the strength of springs being greater in wet than dry seasons. Hence, after incessant rains, they are observed to break out in higher situations, and as the weather becomes dryer, give over running out, unless at their lower outlets. The strength of springs also, or quantity of water, issuing from them, depends chiefly on the extent of high ground that receives and retains the rain, forming large reservoirs, which afford them a more regular supply. Thus bogsprings, or such as rise in valleys and low situations, are much stronger, and have

* Wetness of land is sometimes occasioned by the stagnation of water in the surrounding ditches, or in some adjoining hollow, where, for want of declivity in the former, and owing to the higher situation of the latter, it oozes out upon the lower ground, and finds its way into the open parts of the soil. This is frequently the case, where water is conveyed in a lead or artificial channel, the land lying lower and adjoining to it, being very often wet from that cause. The remedy for these kinds of wetnesses is simple, and points out itself.

a more regular discharge, than those which break out on higher ground, or on the sides of hills.

Independently of these causes, there are certainly great springs contained in the bowels of the earth, otherwise, how could the many rivers that intersect it, be supplied with such vast quantities of water as they discharge, the rains falling on its surface, or the dews that descend, not being adequate for that purpose; but, as this may be considered among those arcana of nature which have not yet been sufficiently explored, and lying at too great a depth to affect the surface, it comes not within the limits of the present inquiry.

With the nature and cause of springs, that of bogs is intimately connected: for where springs breaking out in the manner above described, run over a flat surface of clay, and cannot get off with sufficient rapidity, or are not confined to a narrow channel, the superabundance of water must cause the dissolution of all the coarse vegetables it produces, which together with part of the natural soil itself, are formed into a peat earth, every year increasing in depth; and the extent of such bog, or morass, is according to the quantity of water, and to that of the flat ground on which it is formed.* The great object of Mr. Elkington's system, is that of draining such bogs, by cutting off entirely the source of the springs or subterraneous water which causes the wetness, either by flowing over the surface, or by its being long confined under it. If the springs have a natural outlet, the object of the drain is, to lower and enlarge it, which, by giving the water a more free and easy channel, will soon discharge and draw it off; or will reduce it to a level so far below the surface as to prevent its overflowing it.

Where the springs have no apparent outlet, but are either confined so far below the surface, as to injure it by constant moisture, or by oozing out imperceptibly through any small pores of the upper soil; the object of the drain is, to give a proper vent to that water, and to extract more quickly and more effectually what has before been pent up in the bosom of the soil. The object of the auger, which, in many instances is the *sine qua non* of the business, is simply to reach or tap the spring, and to give vent to the water thus pent up, when the depth of the rain does not reach it, where the level of the outlet will not admit its being cut to that depth, and where the expense of cutting so deep would be very great, and the execution of it very difficult.

According to these principles, this system of draining has been attended with extraordinary consequences in the course of Mr. Elkington's practice, which shall be more fully explained in the subsequent part of this report. By it, not only the land in the immediate vicinity of the drain, but also springs, wells and wet ground, at a considerable distance, have been made dry.

* Many and various are the conjectures respecting the origin of peat bogs; into the merits of which, it would be needless to inquire. Some suppose them to have been formed at the time of the general deluge from the huge trees that are found in them, and from a variety of other circumstances that led to that supposition; but it is not so much the subject of this treatise to explain their probable origin, as the means by which springs or other accumulated water may be most easily cut off, from preserving them in their present unproductive state.

with which there was no apparent communication.

As the whole depends upon the situation of the ground to be drained and the nature and inclination of the strata of which the adjacent country is composed; as much knowledge as possible must be obtained of these, before the proper course of a drain can be ascertained, or any specific rules given for its direction or execution. But all these circumstances will be more particularly explained in describing the parts of the operation with which they are connected.

From the American Farmer.

THE HESSIAN FLY.

This destructive insect is propagated from the eggs of the fly deposited on the grains of wheat when ripening; the truth of which I learned from actual observations. The fly may be seen by the middle of June, and from that time till wheat is cut, flying about and lighting upon ears of wheat. It deposits its eggs upon the outer ends of the grain, where they may be seen with a good microscope or optic glass—sometimes to the number of six or seven on one grain.

They remain there till the grain is sown.—The warmth necessary to produce vegetation is sufficient to animate the insect. It bursts its shell and enters the shoot, where it lies in a torpid state till the next spring, except in some instances when wheat is sown early, the fly commences its ravages in the fall; when this is discovered, the best method is to turn sheep upon it and pasture it short either in the fall or in the winter.

The most effectual way to check the propagation, is in preparing the seed before sown, which should be in the following manner:—Put your seed into a hogshead, tub or vat, and cover it with water; let it stand ten or twelve hours; then put off the water, put the wheat upon a barn floor and sprinkle lime over, and with a shovel mix it till it is well covered with lime. Let it remain in that state about twenty-four hours, and the eggs will be destroyed without any injury to the seed.

The following brief sketch of the observations which led to the discovery abovementioned, is given, that all who wish to be satisfied of the truth of it, may have ocular demonstration of the fact, if they will take the trouble. On viewing several grains of wheat in a microscope, something resembling the eggs of insects was observed upon them: twenty grains were selected with those appearances; they were put upon some raw cotton and a little earth in a tumbler of water, and observed every day; and on the day the grain opened and put forth its tender fibre, the insect burst from its shell and was not to be seen.

Ten days after, five of the grains with their roots and blades were taken from the glass and carefully examined. In three of them the insects were found. The other fifteen remained, and over-spread the top of the glass. They were preserved till spring, when, on examining, every stalk had an insect in it, some two and one four.

Twenty other grains were selected, and the lime applied for twelve hours. It was then washed, and the color of the eggs was changed, and being put into a glass in like manner as the other, the wheat grew, but the eggs did not

roduce. The roots were transplanted, and grew well, and ten bushels of wheat limed as above, produced a good crop, while the neighboring fields suffered materially, and some were almost wholly destroyed by the fly.

A FARMER OF BUCKS COUNTY.

METEOROLOGY.

MR. SKINNER—As in our very dry seasons, the most of your readers are watching the wind and the signs, as they are termed, for rain, I have thought the following translation from a French work, called "Erreurs et Prejuges," might be acceptable to them.

"The Abbe Toaldo has demonstrated that in 106 new moons, 950 have been followed by remarkable changes of weather. There are then 950 chances to 156, or what is the same thing, six to one that a new moon will produce a change of weather. The other phases have less influence. The full moon gives but five chances to one. The first and last quarters give out two and a half to one."—*Am. Farmer.*

The useful properties of Charcoal, for sweetening the breath, chewing the teeth, &c.

All sorts of glass vessels and other utensils may be purified from long retained smells of every kind, in the easiest and most perfect manner, by rinsing them out well with charcoal powder, after the grosser impurities have been scoured off with sand and potash. Rubbing the teeth, and washing out the mouth, with fine charcoal powder, will render the teeth beautifully white, and the breath perfectly sweet, where an offensive breath has been owing to a scorbutic disposition of the gums. Putrid water is immediately deprived of its offensive smell by charcoal.

To sweeten Meat, Fish, &c. that is tainted

When meat, fish, &c. from intense heat, or long keeping, are likely to pass into a state of corruption, a simple and pure mode of keeping them sound and healthful is by putting a few pieces of charcoal, each the size of an egg, into the pot or saucepan, wherein the fish or flesh are to be boiled. Among others, an experiment of this kind was tried upon a turbot, which appeared to be too far gone to be eatable; the cook, as advised, put three or four pieces of charcoal, each the size of an egg, under the strainer, in the fish kettle; after boiling the proper time, the turbot came to table perfectly sweet and firm.

To purify fly-blown Meat.

It has been successfully proved, by many experiments, that meat entirely fly-blown, has been sufficiently purified to make good broth, and had not a disagreeable taste, by being previously put into a vessel containing a certain quantity of beer. The liquor will become tainted, and have a putrid smell.

USEFUL INVENTION.

Mr. Ralph Bulkley, of this city, has submitted to our inspection a specification, accompanied with a diagram, of an improvement in the manufacture of salt by evaporation. As he intends to obtain a patent for his invention in England, we are not at liberty to give a description of his plan. From an examination of his papers,

we are of opinion that the slow and tedious process of evaporation may be greatly accelerated by this improvement; and when we consider the vast quantities of salt which will hereafter be manufactured in the western counties of this State, and find a market thro' the medium of the Erie Canal, there can be no doubt but Mr. Bulkley's improvement in the manufacture of a staple commodity will be profitable to himself and beneficial to the public. It is said one of the proprietors of the extensive salt-works in Onondaga objected to the plan, *because it would make salt too cheap.* This objection would not weigh much with the great mass of the community.—*N. Y. Statesman.*

From Dr. Dwight's Travel.

On the 26th of September, three days after we passed through Portsmouth, on our journey in 1807, Colonel Walker of this town went out on a shooting excursion at 1 o'clock in the morning. For this purpose he embarked in a small boat with an intention of crossing the Piscataqua. When he had passed over about half the breadth of the river, a severe spasm seizing him in the head, sensibly affected his sight, but left him in full possession of his understanding. Apprehending that his situation was dangerous, he immediately turned his course back towards the Portsmouth shore; and as the flood tide, then flowing with great strength, forced him up the river, he steered towards a small wharf about three fourths of a mile above the town. As the boat came near the wharf, he laid the end of a paddle, which he held in his hand, upon a corner of the wharf, in order to lay the boat by its side. But the tide forced him away. He then attempted to reach a rocky point, a few rods above; but while he was in the act of making a stroke with his paddle, by some accident or other he missed the stroke, broke the paddle, and fell into the river where it was about ten feet deep. As soon as he rose above the surface he endeavored to swim; but being unskilled in the art, and encumbered with his clothes and boots, found himself unable. When he perceived that he must sink again, he turned his face towards the shore, designing when he should reach the bottom, to make his way to the spot where he hoped to land, by creeping. Accordingly as soon as he felt the bottom, he made the most vigorous exertions for this purpose; and, when he rose again, had advanced so far towards the shore as to be able to raise his head above the water while his feet touched the bottom. He then walked to the shore, which he reached about an hour before the sun rose. Hence he ascended the bank and walked up the river with the hope of finding some person who might assist him to recover his boat.

To this time Colonel Walker had retained full possession of his reason; but, as he supposed, he now fainted and fell, and had afterwards no distinct recollection of his circumstances until a little before noon on Monday the 28th. Still, he retained a remembrance, which he styles imperfect and visionary, of climbing over stone walls, groping in a cornfield, and endeavoring to reach his house before the news of taking up his boat should alarm his family. The course which he took to find his house he could not remember; and probably did not contrive nor distinguish. But he evidently spent the whole of Saturday, Sunday, and a part of

Monday, in attempting to find his way thither. The spasmodic affection which he mentions, the anxiety and flutter of spirits which he suffered during the while he was in and under the water, and the excessive fatigue occasioned by his extraordinary exertions to gain the shore, affected both his body and his mind in such a manner as to leave him absolutely bewildered. Two days he seems to have wandered in the cornfield and its environs; and two nights to have slept, if he slept at all, within the same narrow limits; and all this on ground which he must have familiarly known. After he had reached the town on Monday morning he made a variety of attempts by wandering through different part of it, as he afterwards remembered, to find the way to his own house; but failed in them all. About 5 o'clock, P. M. he was discovered and conducted home by some bakers in the neighborhood.

To this account, taken from Colonel Walker himself, Dr. Buckminster adds, "Upon coming to the bake house, to which he was probably directed by the light of the oven, Col. Walker asked the men whether they knew where he was, and who he was, and whether they could conduct him to his house. The bake house was in sight of the house of Col. Walker; and directly behind the church where he had worshipped for thirty years. After he came home he was put to bed. Within an hour I visited him and found him in a great degree of perturbation. He knew me however, as he had known his wife, and several of his family, at his first coming home. But he could not be convinced that it was Monday, and not Saturday morning. In my hearing he urged his wife to send a messenger unto a company of men who under his superintendence were working on a road, to tell them that he was unable to give them directions, and they must therefore disperse. Within a few days Col. Walker was so far recovered as to attend to his customary business, and not long after regained his usual health."

I have recited this story because it exhibits man in an attitude, which, so far as known, is absolutely new.

THE FARMER.

It does one's heart good to see a merry round-faced farmer. So independent, and yet so free from vanities, and pride. So rich, and yet so industrious—so patient and persevering in his calling, and yet so kind and social and obliging.—There are a thousand noble traits about him, which light up his character. He is generally hospitable—eat and drink with him and he won't set a mark on you, and sweat it out of you with double compound interest, as some I know will.—You are welcome. He will do you a kindness without expecting a return by way of compensation—it is not so with every body. He is generally more honest and sincere—less disposed to deal in low and underhand cunning, than many I could name. He gives to society its best support—is the firmest pillar that supports the edifice of government—he is the lord of nature. Look at him in his homespun and grey backs—gentlemen! laugh at him if you will—but believe me, he can laugh back, if he pleases.

The young oak, to be a useful tree, must not be reared in a hot-bed. Indulgence in the education of young people often spoils them.

Extract from an able article which commences the last No. of the Massachusetts Agricultural Repository, entitled "Editorial Remarks, by John Lowell, one of the Editors."

"We are reproached with introducing articles which are above the capacity of common farmers. If it be intended as an intimation that we devote too large a proportion of this work to philosophical agriculture, we deny the fact; we always give the preference to homebred, practical essays and experiments. But we are not ready to admit that the introduction of rational and scientific speculations, such as those of Kirwan and Davy is inexpedient. Massachusetts has scarcely a town which does not furnish educated men. Knowledge must be first communicated to them, and from them it will inevitably reach their less informed neighbours. We have devoted many pages to horticulture, to the best mode of raising vegetables and fruits for the table, and if we wish to rise one grade above mere subsistence, we must continue so to do. We shall devote a considerable portion of our journal to horticulture, orchards, and fruits. Massachusetts has fourteen large towns containing a population of one hundred thousand souls. When men are thus collected in great masses they will require the innocent luxuries of the table, and there are none more so than vegetables and fruit. To supply this population of one hundred thousand souls, fifty thousand at least must be employed. Thus nearly one third of the state are interested in acquiring horticultural information, in being taught to manage their gardens. Would you always continue in your present state of ignorance on these subjects? Shall it be said that from June to September in our scorching summers, a traveller may traverse Massachusetts from Boston to Albany, and not be able to procure a plate of fruit, except wild strawberries, blackberries, and whortleberries, unless from the hospitality of private gentlemen? It is painful to reflect, that every cottager in Flanders, Germany, Holland and England, is better supplied with summer fruit than our most opulent farmers.

This almost utter neglect of cultivating summer and winter fruits, materially injures the health of our farmers. How mortifying to see the finest climate for the cultivation of the apple, so undervalued, that many of our farmers are obliged to slice up their summer fruit, and suspend it in the front of their houses to dry, in order that they may have a comparatively insipid and tasteless provision for winter! Yet such is too often, I may say too generally, the case.

The greatest benefit, however, which our farmers would derive from an attention to gardening, would be the acquisition of habits of care and neatness, which would be transferred to their farms.

If each farmer would devote two acres to a garden, and to fine fruits, he would be compelled to be more careful in trimming his trees, in sowing his seeds, in keeping them free from weeds. The habits thus formed would extend throughout his estate. We see this effect in farmers near the great towns; they learn to be their own grafters, and pruners, and their care of their general culture keeps pace with their progress in gardening.

But perhaps it will be replied, we cannot afford the time; it will be too expensive. What! cannot our farmers afford as much time as the

common labourers of other countries who work from sunrise to sunset for from thirty to forty cents per day? No, this is not the real difficulty. It is that the ease of getting an ample support in this country relaxes our exertions. But the progress of manufactures and population will soon bring about other habits, and we hope within a few years to see nurseries of the cherry, and the peach, and the pear, as well as of the apple, in all country towns,—though we think, not only that the last is far the most important, but that it is with that our internal improvements must commence. Till every farmer can lay up his ten barrels of excellent winter apples for his own use, we shall not expect much progress in other branches of gardening."

From the Acadian (Halifax) Recorder of June 21.

DRILLING MATCH.

On Friday last, the 13th inst. this match took place at Willowpark. At 10 o'clock the ploughmen began to muster, and by half past 11 all the prior arrangements were completed by the committee. The length of the field being 30 rods, a breadth of 17½ feet sufficient for seven drills, was measured off for each competitor.—Before starting, H. Yeomans, Esq. gave the six candidates who presented themselves, an opportunity of drawing their respective tickets—marked in running numbers, and by which their lots was to be ascertained. They then proceeded to adjust the poles to their own satisfaction, which had been previously set up under the inspection of J. Albro, Esq. the other gentleman of the committee. The rules prescribed to the workmen were simply these; to draw on each lot seven drills at two feet and a half apart, from centre to centre—to sink the plough to the depth of from 6 to 7 inches—and lastly, to execute with all dispatch, as time would be taken into account by the judges, all other circumstances being equal. Mr. Henry Oliver performed his task with the greatest expedition, being finished in 1 hour 20 minutes, which was at the rate of an acre in 2 hours and a half; and the longest time taken by any of the others was 1 hour 55 min.—equal to 3 hours 34½ min. to the acre.

Lot 1 was drilled in	1 hour 25 minutes,
2 do. do.	1 do. 50 do.
3 do. do.	1 do. 55 do.
4 do. do.	1 do. 50 do.
5 do. do.	1 do. 20 do.
6 do. do.	1 do. 52 do.

This table is exhibited, and these facts mentioned, to bear witness of the rapidity and execution of which the drill system is susceptible. Three hours may be assumed as a fair medium in such a field for preparing an acre for the reception of the manure and the potatoe sets, and a similar portion of time will more than suffice to cover them in. According to this way of reckoning, it will only take six hours to put an acre of potatoes into drills; and allowing afterwards three separate hoeings with the proper machinery at the rate of three hours each, altogether 15 hours, will be requisite to cultivate an acre according to the new plan. During the one half of this time a pair of horses, and during the other half a single horse only will be needed. There can be no comparison, on the score of cheapness, between this and the old manner of raising potatoes with the hand

hoe; keeping out of view the more entire pulverization, and the more thorough destruction of weeds effected by the implements.

At half past one o'clock all the ploughs were stopt as a preliminary to Messrs. Anderson and Blaise coming on the field as judges, to examine the work and determine the prizes. By 2 o'clock they gave in their report, which was immediately handed to his Excellency the Governor, that he might deliver the medals and money to the victors.

The 1st prize, No. 6, to Mr. John Baird, servant to W. Lawson, Esq. a silver medal and	£2 10 0
The 2d prize, No. 1, to Mr. Isaac Pringle, servant to Messrs. Tobins, a silver medal and	2 00 0
The 3d prize, No. 2, to Mr. John Clime, Jr. a silver medal and	1 10 0

His Excellency then called for the Judges to thank them for their attention, adding that he was satisfied they had determined according to the best of their ability, and he trusted their decision would be generally acceptable.

On this drilling match one observation deserves to be recorded. Three years ago when this system of competition was first proposed, the system of drilling was in its infancy; the workmen, with the exception of those trained in the mother country, were strikingly imperfect. The method of drawing straight lines by the erection of poles was unknown to most of the natives of the country who had been accustomed to the use of the plough from their youth, and who reckoned themselves tolerable proficient. The first drilling match therefore on the peninsula gave evidence of this low state of the art, among our native ploughman. A visible improvement was effected in the second, but in the present one, which is the third, two Nova Scotians handled their implements with the skill of a master, and one of them was fortunate enough to carry off a prize.

In fact, the very worst work done on last Friday was equal to the best of any of the former exhibitions; and the whole field, consisting of ten acres, 30 rods long, and 20 wide, and containing in all 123 drills, is a very creditable and even highly excellent specimen of what can be accomplished. Eight different ploughmen have assisted in completing it, and so straight are the rows and equidistant, that it appears to be laid off rather by a garden line, than by the free, easy and unrestricted motion of the plough under the guidance of the eye. The Lathams of Scotland, where all the processes of tillage are carried to the highest acme of perfection, can seldom present a finer and more finished display of drilling; and the curious in the art would do well to inspect the field in question, as redounding much to the honor of the performers.

The minor societies should direct a part of their attention to this subject. They have, with a commendable zeal, instituted ploughing Matches every where, and have reported favorably of the result; it is now high time, that drilling be more thoroughly understood in the country; for it is an incontestable fact, that no man can be a first rate ploughman, who is ignorant of this other art; nay more, that no field can be properly and skilfully tilled, unless the ridges be first marked off by parallel lines at given distances, which lines must be drawn by

the aid of poles on the same general principles. On all these accounts, it is highly deserving of cultivation, consequently of the patronage of the societies. Let them give it countenance, and in a short time the youths of the country will be able to enter the lists and stand a competition with the drillers of G. Britain who are amongst them.

JOHN YOUNG, *Secretary.*

POT AND PEARL ASHES.

In one of the late numbers of Tilloch's Philosophical Magazine, is the following paragraph, announcing a discovery, which, if real, may have a serious effect on the commerce and pursuits of many in the United States.

"I observed, says he, many years ago, that I expected to see the powers of galvanism, in one shape or other, a necessary appendage to the apparatus of every bleach field. Subsequently, I stated that I considered all alkalies, alkaline earths and substances, were modifications of the same base, and that one day I hoped to see our potash taken from the *lime rock* of our own soil, instead of deflagrating the woods of America. After many varied experiments, I have completely succeeded, and have now rendered myself and my country, so far as regards bleaching, perfectly independent of every foreign aid, and at an expense comparatively trifling."

GLUE.

It has been erroneously stated in the public papers, that India rubber will make good glue; but it will never harden. For a strong, firm, cheap glue, nothing has yet been discovered superior to the best kind of that which is in general use: and for a fine, clear, and transparent kind, which will even unite glass so as to render the fracture almost imperceptible, nothing is equal to isinglass boiled in spirits of wine.

Amer. Farmer.

NEW ENGLAND FARMER.

SATURDAY, JULY 26, 1823.

Farmer's and Gardener's Remembrancer.

JULY.

STEELE FIELDS.—As soon as you have completed your harvesting, plough your stubble fields. You may plough in your stubble, or you may burn it off and then plough the land. The last mode of proceeding has been recommended by English writers. They say that the ashes affords a good dressing to the soil, the heat destroys insects, and the fire, by burning the stubble, removes an impediment to the plough. We have heretofore taken notice of an experiment, which proved the advantages of this mode of proceeding, in our first No. page 6. But as we have readers, who, probably, have not seen or taken particular notice of that article, we will repeat the substance of it. Mr. W. Curtis, of Lynn, Norfolk, found very beneficial effects from burning the stubble of oats, which was left eighteen inches high for that purpose. On a field broken up from old pasture the same year, he afterwards sowed wheat and oats in succession on the same ground, the stubble of both which was burned in the same manner. The ashes, in every case, were ploughed in, to a small depth, and the verges of the fields mowed to prevent accidents. After the third crop of corn [grain] all of which was abundant and re-

markably free from weeds, the field was laid down with clover and other grass seeds, and the ensuing crops proved infinitely finer than those before the ground was broken up.

Another piece of ground was cropped for three successive years in the same manner as the first, to which it was similar in every respect of soil, aspect, and previous management, but in which the stubble was ploughed in, instead of being burned; the produce of each crop on it was much inferior to that of the first experiment, and the weeds increased so greatly, that in laying it down to grass, they quite overpowered the grass seeds, so much so, that it was necessary to re-sow it; and ever after, while Mr. Curtis held it, the grass and hay produced were coarse and full of weeds; and consequently inferior both in value and quantity to those of the other field, on which the stubble had been burned.

It may, perhaps, be well in burning stubble fields, not only to mow the verges or borders of the fields, and rake the proceeds inwards towards the centre of the fields, but to trace a furrow round the whole, and set your fire inside of the furrow. A calm afternoon, towards sunset, should be preferred, when the wind will not be apt to rise, and cause damage by the fire.

We do not learn what was the nature of the soil on which the experiments of Mr. Curtis were made; and should not, therefore, recommend a similar practice on all soils, for general adoption, at least without further trials on a small scale. If the crop of grain was on a stiff stony soil, or on land which presents material impediments to the plough, the stubble should in some way be got rid of, before any attempt is made to plough the field. Dr. Deane advised to dispose of the stubble on stiff lands by mowing it, and carrying it to the farm yard. For "such land, when ploughed, is not apt to cover the stubble so closely as to cause it speedily to putrefy. It will often lie in a sound unaltered state for a long time, and be very troublesome at the next ploughing. But if the ground should be seeded after one ploughing, it might be expected the stubble would render the land so hollow and cavernous as to starve many of the plants that grow on the surface. At the same time these hollows would be receptacles for noxious insects and vermin. But in a light sandy soil, the stubble is soon reduced to a condition to nourish vegetables." In such a soil it would, therefore, probably be best to plough in the stubble as soon as possible after harvest, before the sun and wind has robbed it of all its juices, and taken away its power to enrich the soil.

It has been recommended previous to ploughing in stubble to pass a heavy roller over the field to lay the stubble flat on the surface. If this expedient is adopted, great care should be taken to pass the roller the same way the plough is to go. Others advise to annex a small roller to the fore end of the plough beam. A foot piece, or piece of timber, with a mortice in it, through which the fore end of the plough beam is passed, so that the piece of timber stands perpendicular, and the lower end scrapes along on the ground, may be so contrived as to regulate the depth of ploughing, make it uniform, and at the same time greatly assist in clearing the way before the coulter. But we believe the most effectual contrivance for preventing a plough from clogging, is what is called

a "Plough Cleaner," invented by Mr. Joseph Kersey, of Pennsylvania, of which we have given a drawing and description in page 107 of our paper. It consists of a piece of timber, pinned to the plough beam, just before the coulter, with a staff or handle attached to its upper end, so placed as to come within reach of the ploughman, who by pulling the handle, turns the piece of timber on the pin, and causes the lower end to scrape the ground just before the coulter, and thus remove stubble, weeds, and other obstacles to smooth ploughing. This is as simple as it is useful, and has, we are told, been used for several years in Pennsylvania, and found "very convenient."

HARROW, ROLL, AND TOP DRESS YOUR MOWING GROUND.—Mowing land, after it has been laid down a few years to grass, becomes bound, or too thickly swarded, and will produce but little. It may not always be convenient, and is often not advisable, to break it up. In such case, after a plentiful rain, go over your mowing ground with a scarifier, spiking roller, or heavy loaded harrow. Then dress it with some kind of compost in which earth is a principal ingredient. Next pass a heavy roller over the land, unless it be uneven or stony, in which a roller would prove of little or no benefit. Half rotted strawy manure, spread on grass ground is of little service, and the dung of swine or of horses thus applied, will be dried up by the sun and air with but little benefit to the soil or to the crop. If you have on your premises a pond or mud hole, the bed of which is partly uncovered in a dry season, you may take the first leisure time after haying and harvesting, either to cart it into your barn yard, or spread it on your grass ground. It has been recommended by writers, as well as practical farmers, to apply your manure to grass land, especially where a second crop is expected, immediately after mowing the first crop. But in such case it will not answer a good purpose to make use of unmixed dung, or what is called putrescent manure of any kind, as the sun will not only dry it up, but scorch the grass. Compost manure, ashes, soot, &c. loose little if any thing by exposure to the air, but spreading unmixed dung on grass land is a very extravagant way of using it.

SAVE YOUR SUMMER MANURE.—Wherever your cattle are confined every night, as is advisable, it will be but little labor to shovel the manure every morning into a heap or heaps, which should be immediately covered with fresh earth, peat, or some other substance which will prevent its being dried up by the sun, or washed away by the rain. If you keep a horse or horses in a stable, or soil your cattle, it will often pay for the labor to mix earth every day or two with the fresh manure, which will prevent any part of it from being lost by evaporation. Place a few loads of earth near the place where your stables are emptied, or in the enclosure where your cattle are yarded, and from time to time mix such earth with the fresh dung, which will prevent its being weakened, dried, or washed away. If you keep your swine confined in pens, you should be careful as you empty their styes to mix earth with the manure thus obtained. Horse manure, more particularly, will heat, or become "fire fanged," as it is called, without such precaution. You may have first a layer of earth, then of manure, and then again of earth. Sir John Sinclair says,

"In farm yards, where there is an opportunity of making cattle, horse, and hog dung, it is always to be preferred, as the one corrects the defects of the other, and prevents the fermenting process from going too rapidly forward.—These substances should be laid *stratum super stratum*, [one layer above another] which can easily be done every day, when the stables, cow houses, and hog styes are cleaned out. If a little earth can be put between each stratum, so much the better." Even in your pastures, if you have plenty of help, or boys who run the risk of being idle, it will be best, especially near watering places, places where your cattle are salted, &c. to gather frequently their droppings into little heaps, and cover them with earth, or sods of grass, with the grass side down. The whole may be carted to your large manure heaps, compost beds, stercoraries, &c. or applied, if sufficiently rotted or fermented, to your grass ground, as a top dressing in autumn. This would be what we call *neat farming*, and a slovenly farmer will not thrive.

DO NOT FORGET TO GIVE SALT TO YOUR CATTLE, HORSES AND SHEEP.—One would think that foreign writers had not, till within a few years, been aware of the use of salt as an article in the diet of domestic animals. Sir John Sinclair (Code of Agriculture, page 56) mentions it as something remarkable, that "in America, salt is given to cows, oxen, horses and to sheep, but not to pigs." He also says that "lumps of rock salt might be kept in troughs, protected against the effects of rain in the fields, by covers, but accessible to sheep or cattle." It appears that a patent has been obtained by Messrs. Martin and Co. in England, for a peculiar mode of preparing salt in large cakes, by which it is rendered less liable to melt and waste by rain than common salt. It is recommended to allow calves, especially, to have constant access to fine salt, to be kept in a trough near them, separate from their other food. It is said that it prevents and cures the rot and flukes in sheep; and prevents injury to stock by moist feed. Likewise, when horses are afflicted with salivation, or a running of saliva from their mouths, salt will mitigate if not cure their complaint. Some writers say that twice a week during the summer is often enough to give salt to any domestic animals. Sir John Sinclair asserts that "the quantity given in spring, summer, and autumn, to oxen and milch cows, is about a quart to each every two or three days, in very hot weather. In cooler seasons it is only given once a week." We are inclined to think this a liberal allowance. But if salt is kept in troughs under cover, where they can have free access to it, we do not believe they would be apt to consume more than would prove for their benefit.

LATE PEAS.—We think it very possible that peas may be raised, by proper management, during the whole summer, and till severe frosts commence in autumn. The evil, which has usually attended late sown peas, and rendered it impracticable to raise them to much advantage after about mid-summer, has been their liability to mildew or rot. "Both in Europe and America, the pea sowed for an autumnal crop, is generally, we might say almost universally, subject to mildew, so that we cannot enjoy this delicious green vegetable for more than two months in the year." A very valuable paper "On the prevention of Mildew, in particu-

lar cases: by Thomas Andrew Knight, Esq'r. F. R. S. &c. &c. President of the London Horticultural Society," was published in London, and re-published in the last No. of the Massachusetts Agricultural Journal. The author of this paper adopts the opinion of the venerable President of the Royal Society (the late Sir Joseph Banks) that mildew is a species of plant, which botanists call fungus, and which grows on wheat, peas, some sorts of grass, &c. and robs them of a part of their nourishment. That this plant has its seeds, like other plants, which seeds are excessively light and capable of being dispersed every where by the wind. The author then proceeds to point out the means by which the injurious effects of the common white mildew may be in particular cases prevented, as follows:

"The secondary, and immediate causes of this disease have long appeared to me to be the want of a sufficient supply of moisture from the soil, with excess of humidity in the air, particularly if the plants be exposed to a temperature below that to which they have been accustomed. If damp and cold weather in July succeed that which is warm and bright, without sufficient rain to moisten the ground to some depth, the wheat crop is generally injured by mildew. I suspect that in such cases, an injurious absorption of moisture by the leaves and stems of the wheat plants takes place; and I have proved, that under similar circumstances much water will be absorbed by the leaves of trees, and carried downwards through their albuminous substance; though it is certainly through this substance that the sap rises under other circumstances. If a branch be taken from a tree when its leaves are mature, and one leaf be kept constantly wet, that leaf will absorb moisture, and supply another leaf below it upon the branch, even though all communication between them through the bark be intersected; and if a similar absorption takes place in the straws of wheat or the stems of other plants, and a retrograde motion of the fluids be produced, I conceive that the ascent of the true sap, or organizable matter, into the seed vessels, must be retarded, and that it may become the food of the parasitical plants, which then only may grow luxuriant and injurious.

"This view of the subject, whether true or false, led me to the following method of cultivating the pea, late in autumn, by which my table has been as abundantly supplied during the months of September and October, as in June or July, and my plants have been as nearly free from mildew.

"The ground is dug in the usual way, and the spaces, which will be occupied by the future rows are well soaked with water; the mould upon each side is then collected so as to form ridges seven or eight inches above the previous level of the ground, and then are well watered. After which, the seeds are sowed in single rows along the tops of the ridges. The plants very soon appear above the surface, and grow with much vigor, owing to the great depth of the soil and abundant moisture. Water is given rather profusely once a week, or nine days, even if the weather proves showery.—Under this mode of management the plants will remain perfectly green and luxuriant till the young blossoms and the seed vessels are destroyed by frost, and their produce will retain

its proper flavor which is always taken away by mildew. The pea which I have planted for autumnal crops is a very large kind, of which the seeds are much shrivelled, and which grows very high. It is now very common in the shops of London, and my name has been, I believe, generally attached to it. [It is well known by us by the same name, and is an excellent late variety.—*Ed. Ag. Journal.*] I prefer this variety, because it is more sweet than any other, and retains its flavor better late in autumn. It is my custom to sow some of it every ten days, and I rarely ever fail of having my table supplied till the end of October."

CLOSE OF THE FIRST VOLUME.

The present number completes the first volume of the New England Farmer, and with the next we shall commence a second volume, with renovated exertions, and hopes invigorated by some degree of apparent success, which has attended our past labors. We are told that our efforts have been in some measure acceptable, and the cheering sound of "well done," will excite us to summon all our powers, and put all our faculties in requisition to render ourselves still more "useful to the farming interest."—New sources of agricultural information are daily unfolding before us, and all that our industry can accomplish, aided by an undissembled fondness for the science and predilection for the pursuits of the art which is paramount to all other arts, we unhesitatingly promise to perform. The Editor hopes and expects to be able hereafter, as long as the patronage of the public and his own capacity for intellectual toil shall continue, to devote himself more entirely to the object of rendering his paper worthy of the approbation of the enlightened cultivator, than has hitherto been practicable. He proposes to explore new fields of agricultural information, with an inquisitive, if not with a discerning eye, and the result of his researches will be faithfully submitted to the consideration of that greatest and most important class in the community, to whose interests the New England Farmer is principally devoted. As he continues his work he promises every endeavor to become a better workman, and hopes eventually to become a profitable, as he proposes to be a diligent laborer in the great field of Agriculture.

We respectfully solicit the continuance of the favors of correspondents, and return our sincere thanks for such as we have already received. We wish to collect for the use of the public, the fruits of actual experience. Theories and ingenious speculations may be useful, but facts judiciously selected and accurately reported must be useful. We likewise are very solicitous not to publish any thing which may mislead the practical farmer. Our intentions are upright; but "to err is human." For instance, should the Editor, or any of his correspondents, recommend any plant, or any process of cultivation, which any of our friends, who are better in-

formed on the subject, know or believe not to be useful, it might be rendering a service to the public, and would certainly be very acceptable to us, to point out our mistake, which shall be promptly and thankfully corrected.

The Index to the first volume will be published in a few days, and immediately forwarded to those who have taken all the numbers.

A few of our subscribers have requested to have the paper discontinued at the close of the first volume, who have neglected to pay for it; but it is our invariable rule not to discontinue any paper until all arrearages are paid.

INFORMATION WANTED.

A friend of the Editor is solicitous to be informed at what time in the year it would be most advisable to cut *chestnut wood*, designed for fencing, in order that the timber, and especially that part of the posts, which is set in the ground, may possess the greatest durability. Mr. Preston of Pennsylvania, in his valuable communication published in our paper, No. 45, page 351, estimates that hemlock cut and peeled at the season of its peeling the second time, or in October, will be the most durable. Perhaps he may be able, and will be so good as to inform whether the same rule will apply to chestnut. And it may be that some other gentlemen friendly to the farming interest, will favor us with their experience or opinions on this subject, which would be thankfully received, and may prove beneficial to the community.

FOREIGN.

The last arrivals from Europe have brought advices from London to the 8th, Lisbon the 13th, and Paris the 5th of June. From these it should seem that the French have apparently succeeded in re-establishing the ancient order of things in Spain, and the hopes of the Constitutionalists are blasted, and the fears of the friends of liberty realized. We have another "confirmation strong" that an ignorant and superstitious people cannot be a free people. That knowledge is necessary for the enjoyment of rational liberty; and a people loosened from his chains is not more incapable of self-government than the high and the lowest orders of the people in Spain. The middle class appears to want union, number, energy, courage, and perseverance, and this attempt to shake off their shackles will, we fear, end in the addition of heavier and stronger shackles.

Should we attempt to give details of what are styled "War operations in Spain," we should fill our columns with petty affairs of posts and skirmishes, which end in nothing but submission to the will of dictators, who have succeeded in dragging Spain into that despotism which she would have escaped if she had not merited it. It was not the will of the Spaniards to be free, and therefore they are not free. They court their chains, and love darkness better than light; they must therefore remain the unpitied victims of tyranny and bigotry, and will probably sink the deeper in the mire of despotism in consequence of their late feeble and ineffectual struggles to place themselves on high ground, and gain a respectable standing among powerful and civilized nations.

On the 29th of May, the French army appeared before Madrid, in consequence of a previous convention that it should enter the city. But this was not effected peaceably as had been anticipated. The French account states that the men, women, and children, who went to meet and welcome General Bessieres, the Royalist commander, were fired upon from two masked cannon loaded with grape, and were charged by the Constitutional cavalry, when nearly three hundred of these poor people, composing fathers, mothers, brothers and sisters, many of them mere children, were massacred without pity, &c. The Spanish accounts make the Royalists the aggressors, and tell us that General Bessieres declared that he was accustomed to victory, and determined to enter Madrid, even if he must do it by main force. A general action ensued, in which the Spaniards lost 80 killed, and 700 made prisoners and wounded.

The Spanish forces appear to be scattered like flocks of sheep without shepherds. The Spanish commanders have as little efficiency or concert as so many *bull-wethers*. The new Spanish government is organized under French auspices at Madrid, has passed several decrees, and appointed ambassadors to the courts of Europe.—The road to Seville, the new capital, appears to lie open to the march of the French armies, and what is called the cause of legitimacy seems every where to triumph.

Portugal.—In this country a counter-revolution commenced on the 27th of May, under a certain General named Sepulveda. The young Prince, at the head of a regiment of troops, marched into Lisbon on the 3d of June, and was welcomed by the people with the cry of "long live the King." The Cortes were dissolved and fled. The next day the King denounced the Cortes as a set of usurpers and hypocrites, and proclaimed their dissolution as a body. He likewise issued a proclamation announcing the restoration of the Ancient Monarchy. This counter-revolution suits the highest and lowest classes of the people, viz. the froth and the dregs of the community. But the middling class, the farmers, and others of the more substantial part of society, are greatly dissatisfied. Several of the most active members of the Cortes have embarked for England.

An arrival at New York from Gibraltar, has brought papers from the last mentioned place to the 7th June. These furnish articles from Seville of somewhat later date than had been received when the above was written. There are some glimmerings of hope for the Spaniards, derived from this news, which, perhaps, may brighten into sunshine. The French and Spaniards have had an encounter at Talavera, in which the latter conducted with gallantry, and gave their opponents a sample of the times, when Bonaparte was baffled, and his troops taught "the manual exercise of heels." It was, however, but a *brush*. The loss of the Spaniards was "confined to 40 or 12 wounded," and that of the French was said to be greater, but probably did not amount to any considerable number.

DOMESTIC.

The Sea Serpent again exhibited himself on the 12th inst. near Nantux, with his usual bunches and other appendages and appurtenances "resembling a row of porpoises, proceeding with an undulating motion like that of a caterpillar," &c. He was seen, and his appearance attested to by Francis Johnson, Jr. Mr. J.'s testimony on this subject was given in presence of some very respectable gentlemen in this vicinity, viz. H. A. S. Dearborn, Nathaniel Amory, Sidney Bartlett, Richard D. Harris, Thomas Whitmore and Russel Jarvis; and these gentlemen have published a certificate, that from their knowledge of the character of Mr. Johnson, they have no doubt of his veracity. Serpents of this species are no strangers on the coast of Norway. The old editions of Guthrie's Geography mention their appearance, as well as many other and later authors, whose testimony, in corroboration with what has been frequently seen off our own coast, must render the existence of this species of monster no longer doubtful.

Thunder Storm.—On the 11th inst. Northampton and the towns in its vicinity were visited with a violent storm of thunder and lightning. The house of Mr. A. Wright, of Westhampton, was struck, and the timbers, partition, 100 panes of glass, and much of the furniture were broken. There were ten persons in the house, but providentially only one, a lad, was injured. He was knocked down, had his hat rent, his jacket and shirt torn, and his flesh singed; but has now the appearance of recovery. A house in Chesterfield was struck in the same storm, and much injured.

Fires.—A fire took place in Philadelphia on the 17th inst. which destroyed eleven two-story frame houses, with all the back buildings, stables and sheds in Calowhill and Kunkle streets. A paper ware house, owned by the Bank of North America, a tobaccoconist factory, a chocolate factory, and a large tavern, were among the buildings consumed.

A range of buildings in Albany was destroyed by fire on the 13th inst. Loss estimated at from 12 to 15,000 dollars.

AGRICULTURAL PREMIUM, FOR THE BEST MANAGED FARM.

At a meeting of the Board of Trustees of the Massachusetts Society for promoting Agriculture, held at the President's, 12th July, 1823, it was

Voted, That this Society will grant as a premium to the owner of the best cultivated Farm within the precincts of the several Agricultural Societies of the State, the sum of Thirty Dollars each, in addition to the premium which may have been awarded the claimant by the local Society; and that it will accept, as full evidence of the merit of the claimant, a certificate signed by the President of the local Society, certifying that such person was declared by the Society or their Trustees, entitled to the premium within that district;—that the applicant shall, however, in all cases, be held to exhibit to this Society, a statement of the extent of his farm; the state and plan of his farming buildings; his mode of collecting and managing manure; the number of domestic animals usually supported thereon; the quantity and quality of land under cultivation, and his usual mode of culture, as well as the average amount of his crops, of all sorts.

A copy from the record,

BENJ. GUILD, Assistant Rec'g Sec'y.

July 18, 1823.

SONNET.

I dreamed—I saw a little rosy child,
 With flexen ringlets, in a garden playing;
 Now stooping here, and then afar off straying,
 As flower or butterfly his feet beguiled.
 'Twas chang'd; one summer's day I stepp'd aside,
 To let him pass; his face had manhood's seeming,
 And that full eye of blue was fondly beaming
 On a fair maiden, whom he call'd "his bride!"
 Once more; 'twas evening, and the cheerful fire
 I saw a group of youthful forms surrounding,
 The room with harmless pleasantry resounding;
 And in the midst I marked the smiling sire.—
 The heavens were clouded!—and I heard the tone
 Of a slow moving bell—the white hair'd man was gone!

BERNARD BARTON.

Alias the Quaker Poet, with whose charming productions our columns have been frequently enriched, is not one who mechanically strings verses together, but a writer of genuine poetry. And however paradoxical it may appear to those who can relish nothing but what savors of titled rank, it is nevertheless true that Barton has presented the literary world with some gems from Parnassus which sparkle with a brilliancy not often surpassed. In speaking of the poets of the present day, in "A Sketch of Old England, by a New England Man," the author of that most excellent work, which ought to be read by every American, says—

"There is one modest bard here, that deserves to be mentioned as a novelty. I mean the Quaker, Bernard Barton, who has been moved lately by the spirit of poetry. As might be expected, he writes with sweetness, simplicity and good sense; the two latter very rare commodities at present in poetry, when the bards of England go abroad to write, and bring home all the fervid heats of a tropical sun, backed by the scorching sirocco of the desert, to excite us into a proper degree of poetical enthusiasm.—Friend Bernard's poetry is tender without exaggeration, and simple without childishness. His Pegasus is neither an elephant, a camel, nor a dromedary, but a horse of good pace and habits. In a better age of poetry he would be more admired. As it is, his Muse wants a few of the buttons of the honourable band of gentlemen pensioners to make her shine, and is, moreover, rather *drab-colored* for the present flashy taste."

PUNCTUALITY.

President Washington was the most punctual man in the observance of appointments, ever known to the writer. He delivered his communications to Congress, at the opening of each session, in person. He always appointed the hour of twelve at noon for this purpose; and he never failed to enter the hall of Congress while the State-house clock was striking the hour. His invitations to dinner were always given for four o'clock, P. M. He allowed five minutes for the variation of time-pieces; and he waited no longer for any one. Certain lagging members of Congress sometimes come in when dinner was nearly half over. The writer has heard the President say to them, with a smile, "Gentlemen, we are too punctual for you—I have a cook who never asks whether the company has come, but whether the hour has come."

From the N. York Medical and Physical Journal.

PIGEONS.

Extract from "Remarks on the Columba Migratoria, or Passenger Pigeon," by the Hon. De Witt Clinton.

The Columba Migratoria, or Passenger Pigeon, is a bird peculiar to North America. It extends its migrations from Hudson's bay to the gulf of Mexico, and it occupies occasionally that vast region which reaches from the gulf of St. Lawrence to the Rocky Mountains. Its change of residence is not owing to the influence of heat or cold, of rain or drought, but is made with a view to the acquisition of food. The vast flocks in which this bird congregates, are unequalled as to extent. La Hontan says that the bishop of Canada has been forced to exorcise them oftener than once, on account of the damage they do to the products of the earth.—Weld, an English traveller, speaks of a flock eighty miles long, flying over lake Ontario; and Wilson, the great ornithologist, estimates one seen in Kentucky 210 miles long, a mile broad, and containing 2,230,272,000 pigeons, which would consume on a moderate allowance 17,121,000 bushels of mast, [beech nuts and acorns] a day.

The gregarious habits and vast flocks of this bird will of course occasion a correspondent consumption of food; and it is therefore compelled to be constantly erratic, and to be among the feathered race what the nomades [wandering shepherds] are among mankind. The rapidity of its flight is superior to that of the carrier pigeon, which has been known to pass from St. Edmundsbury to London in two hours and a half. At this rate, the Passenger Pigeon can travel seven hundred miles in twenty-four hours; and at the rate of a mile a minute, the same distance in less than twelve hours;—and this velocity may account for undigested rice being found in its craw six hundred miles from the rice fields: but as this has been observed in the spring of the year, it must have been derived in that case from the gleanings of a former season, or procured at a greater distance, or confounded with the *zizania aquatica* of the western waters.—The favorite food of this bird is the beech nut, and it prefers to establish its roosting quarters and its breeding place within the reach of this aliment. It also subsists on the acorn, chestnut, wild cherry, seeds of the red maple, and of some weeds, poke, and other kinds of berry, buckwheat, and the principal cerealia [grain.] It resorts to the sea-shore and the salines of the west for salt, and it is frequently seen at the mineral springs of Saratoga enjoying the luxury of the waters.

MISAPPLICATION.

The following very good advice is extracted from Cicero's celebrated treatise De Officiis.

Two faults are to be avoided in the truly honorable and natural investigation of knowledge and science. The first is, that we should not take hypothesis for facts, and inconsiderately give them our assent. The other is, that many bestow too great labor on points obscure and difficult, and at the same time unnecessary. Which faults avoided, whatever diligence and care may be bestowed on subjects honorable and worth acquiring, will meet with just commendation.

RUINS OF BALBEC.

Dr. Richardson, who visited the ruins of the magnificent temple at Balbec, in Syria, in his late travels, is of opinion that this was first built by Solomon, and rebuilt by the Romans. The workmanship of the bottom stones is similar to that of some that were cut at Jerusalem in the time of that king. In the walls of this temple are some of the heaviest stones that were ever moved by human hands or human machinery.—Dr. R. measured one stone which was 67 feet long, 11 broad, and 9 feet thick; two others were nearly of the same dimensions, and the three were placed more than 20 feet above the foundation. In no other building on earth can such ponderous masses be found. This temple has been a place both of pagan and christian worship. The ruins are about 40 miles north of Damascus.

"I think there are two periods in the life of man in which the evening hour is peculiarly interesting—in youth and in old age. In youth we love it for its mellow moonlight, its million stars, its then rich and soothing shades, its still serenity; amid these we can commune with our loves, or twine the wreaths of friendship, while there is none to bear us witness but the heavens and the spirits that hold their endless sabbaths there—or look into the deep bosom of creation, spread abroad like a canopy above us, and look and listen till we can almost see and hear the waving wings and melting songs of other beings in other worlds—to youth the evening is delightful, it accords with the flow of his light spirits, the fervor of his fancy, and the softness of his heart. Evening is also the delight to virtuous age—it affords hours of undisturbed contemplation—it seems an emblem of the calm and tranquil close of busy life—serene, placid, and mild, with the impress of its great Creator stamped upon it; it spreads its quiet wings over the grave, and seems to promise that all shall be peace beyond it."

USEFUL INVENTION.

M. Farkas de Farkasalva, in Hungary, has invented a machine by which a person may plunge to the bottom of the sea, walk at the bottom, work with hands and feet, ascend easily to the surface, or stop in the middle, without any help; and in this manner remain several days under water, without intermission and without effort. It costs about £90, and only employs two men.

A GUN DISCHARGED.

We remember to have heard a good story relating to one Alexander Gun, who belonged to the Customs at Edinburg, and was dismissed for improper conduct. The entry opposite his name in the books stood thus: "A Gun discharged for making a false report."

TERMS OF THE FARMER.

Published every Saturday, at THREE DOLLARS per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing will be entitled to a deduction of FIFTY CENTS.

No paper will be discontinued (unless at the discretion of the Publisher) until arrearages are paid.

Agents who procure seven subscribers, and become responsible for the payment, will be entitled to a copy gratis, and in the same proportion for a larger number.
